ALF COOKE, LEEDS

A CRETAN MAIDEN.

THE LEISURE HOUR.

# SENIOR AND JUNIOR:

## A COUNTRY TOWN CHRONICLE.

BY LESLIE KEITH, AUTHOR OF "GREAT GRANDMAMMA SEVERN," "THE CHILCOTES," ETC.

### CHAPTER I.—IN AN OLD GARDEN.

"YOU MUST DRIVE OVER THERE TO-MORROW, MARY."

MR. ANDREW HALLETT was undoubtedly the most important person in Melchisford, not even excepting Dr. Smee and the rector of St. Peter's, the Reverend Septimus King.

He did not take any particular pains to hide that this was his own opinion, and that was perhaps how it chanced that in time it came to be the general opinion also. And this is not so wonderful a thing as it may seem, because that body corporate, the general public, is not very clever, and is besides mentally lazy, and it is very apt to take a man at his own valuation. So that when Dr. Rose, by his conduct, as good as said he was a poor creature, everybody agreed with him; and when Mr. Hallett, by his, practically announced that he was an important person, everybody agreed with that too. Perhaps the bishop, when he came on visitation, and Mr. Justice Buller, when he presided at the assizes, were entitled to more deference than Mr. Hallett; but the bishop and the judge were casual visitors, mere accidents, as it were, in the social life of Melchisford, and Mr. Hallett was there always. That was possibly his chief claim, after all; he

was there, and had been there in the persons of his forefathers as good as always; that is to say, for three generations, which is a long time in a little country town.

Mr. Hallett had, however, several distinct claims to local notice. He was a Melchisford man by birth, as we have seen, and he had been faithful to his native town, even when his business had so prospered that he might without disloyalty have migrated to London, where his talents would have secured him a wider recognition.

Somehow, in course of time, Melchisford came to congratulate itself on this singular disinterestedness on the part of its chief citizen, and vaguely to feel that he had sacrificed himself on the altar of duty when he married Miss Mary Mellish, the banker's daughter, instead of sharing his fortune with one of the London ladies, who were popularly understood to be quite ready to listen to him. For the lawyer was a travelled man and went often to town, sometimes on private business, and occasionally on one of those semi-official deputations in which affairs are usually very pleasantly tempered with pleasure. He had one or two friends, professional and otherwise, whom he had taken care not to lose, and whom he took by the way on one of those trips to the capital. He dined at Fulham or Clapham, at Hampstead or Highgate, and sometimes in genteeler quarters too; and he made a point of taking a glance at the galleries and seeing the last new pieces at the theatres. His opinions on Art, indeed, were received with a good deal of respect in Melchisford, and if he were silent about the merits of the latest tragedy or comedy, that was in deference to the older-fashioned of his townsfolk, who had an inherited prejudice against play-actors and play-houses. It behoves a lawyer to be all things to all men.

Mrs. Hallett missed her husband when he went on one of these little expeditions, and welcomed him back very tenderly; but she never proposed to go with him. She had not that imperative need of consulting the doctor which takes so many ladies to town, and she found herself able to supply all the deficiencies of her own and her daughter's wardrobe in Melchisford. She was a pleasant-faced woman who had carried her early comeliness unimpaired into middle life, and she had very correct if old-fashioned views of wifely submission. She had held it, indeed, to be great promotion when, a quarter of a century before, young, tall, broad-shouldered, black-haired Mr. Hallett had stepped across George Street and carried her over the way to preside in the red-brick house that faced the bank, where three generations of Halletts had lived in succession; and twenty-five years of companionship had not in any way lessened her sense of his condescension.

For a woman who had none of the modern restlessness, who suffered no vague discontent, no grudge against Nature for the accident of sex that limited and curbed her aspirations, it was a very pleasant home. At the risk of condemning her in the eyes of some of her sisters I will say that Mary Hallett had not a wish that was not bounded by its walls, and that she found in its ordering a task that filled both hands and heart.

If you happened to alight at Melchisford you would have no difficulty in finding the lawyer's house. Passing under the railway viaduct, and proceeding by the meaner thoroughfare that leads to the glories of George Street, you speedily reach the Corn Exchange and the fountain erected by a patriotic citizen for the benefit of distressed horses and cattle. Skirting the base of the latter, two roads branch off for your choice; the wider and better of these is George Street. Here the more flourishing drapers, grocers, and bakers are to be found, and here is Mellish's bank, while opposite it, its tall Queen Anne windows flush with the walls, stands the Red House, as it is locally called, by reason of the fine old brick of which it is built. If you cross the street you will notice a brass plate with "Hallett and Sons, Solicitors," engraved on it, and on the wire blinds of the lower windows to the right of the door the word "Office" is placed for your guidance.

It is a large house with five windows in a row on the second floor, but though it stands out from the shops on either hand as if it had elbowed them aside, desiring more breathing space—much as the lawyer swelled his chest when he wished to be impressive—its crowning charm remains unrevealed.

You only discover this, indeed, by entering the house to quit it immediately and pass out to the old garden beyond; a garden such as you can find nowhere except in a sleepy country town, where progress is slow-footed, and where as yet the jerry-builder and the bijou semi-detached villa have refrained from troubling; a garden which a mellow brick wall—in itself a delight to the eye—hides from the curious; a garden which has ripened in the slow course of years, while one master after another has passed from his tenancy of the old house to the churchyard of St. Peter's; a garden which is an emblem of life in its autumnal decay, its winter's sleep, its new birth in the spring, its "bridal of sap and shoot;" a garden goodly with spreading cedars, with mossy turf, with yew-tree walks where young love has been crowned, where sorrow has gone by heavy-footed; where some hopes have been born and some have been quietly laid to sleep; where a great many commonplace thoughts and plans, and some unworthy ones, perhaps, have been entertained; for these, which make so large a part of all our lives, do but help their tragedy. Perhaps the trees whisper of these things when they bend together in the twilight. Even of the unromantic provincial Halletts, what could they not have told if one had but the key to their language?

But this old garden, with its long memories and its secrets known only to the birds, does not betray itself by even a hint from the street. Not so much as a stray petal is there to whisper of its treasures, not a bird-note to sing of its glories. It is all shut away, a possession apart, reserved for the master's use, and shared only by those whom he chooses to honour.

In his way the lawyer was proud of his garden as he was proud of his house, chiefly because

both had belonged to the Halletts little short of a century. We are apt, rather irrationally, to think this a less vulgar variety of pride than the pride of the man who builds his own smart villa and carefully matches the complexion of the flowers in his ribbon borders; and yet the lawyer was not a whit better than he, and inasmuch as he prized his garden only because he was the owner of it, he scarce deserved to claim it.

Mary Hallett loved it in a simpler way; perhaps since she was only a Hallett by marriage she could not be expected to feel about it quite as her husband did. Here she had come as a bride, here for twenty-five years she had watched the fruit ripen on the south wall with an eye to the preserving season, had plucked the flowers with a sort of kinship in their old-fashionedness, had played with her baby girl and had seen her grow to maidenhood as the flowers grow, herself fairer than any flower.

Perhaps it was Hester Hallett who loved the ancestral garden best, after all—loved it with a kind of personal affection as if all the toil and patient labour of generations had humanised it and taught it to respond to her thoughts. It was a world of inspiration to this young girl whom her father and mother, dearly as she loved them, often failed to understand. She dreamed her dreams here, and here, in the leisure of her thoughts, she entertained her maiden fancies about that strange thing called life. Already, though she was not twenty, it was a garden of memories. Here, where the trees grew close and the lawn narrowed to a glade, she had stolen, as a little girl, on a moonlight night, to see the fairies dance; by the deciduous cypress that pointed a tapering green spire to the sky her birthday feasts had been spread; under the lime with its melodious hum of bees in her ears she had tasted the delights of her first story-book, and had straightway been made possessor of a new world; in the yew-tree walk it seemed to her that she had one day lost her childhood, and had come into her woman's inheritance at the other end.

So far, all her recollections were untinged with regret. Whatever might be in store for her, as yet no serpent had entered her Eden, no angel barred the way with forbidding sword of flame. Hester had lived in it and studied it till she knew every modest green thing that made its home there. She shared her mother's simple tastes, and found the green garden a world wide enough for her young fancies; her own room looked out on it, and even in winter she preferred the vision of its leafless sleep to the livelier prospect offered by the windows at the other side of the house.

Mrs. Hallett sometimes wondered, with a mild undernote of vexation, at Hester's love of solitude. She herself found in the panorama of the street an interest that made life almost brilliant; that she knew every actor in the drama took nothing from its charm. She looked across at her early home, as in her girlish days she had peeped from behind the curtains of the bank drawing-room at the Hallett's tall red house, and the complexion of her thoughts had scarcely changed in all these years.

It would seem to most of us but a narrow world that the width of a street could measure—not an epic life, not a life of robust realism or of strong emotion; and yet through it all one woman had kept her simple sweetness and her wholesome, kindly interest in her fellow men and women. It is only in quiet country places that one finds those placid, untroubled natures whom the hurry of our age has left behind

On a spring afternoon Mrs. Hallett descended from the sitting-room that looked upon the street and went into the garden to find lost Hester.

It had become an almost unconscious habit with her to sit in the dusk at that window and watch for the head of her brother, John Mellish, to appear above the wire blind of his private room in the bank. A habit soon grows into a custom in such a place as Melchisford, where there is time for everything. There was time and to spare for John Mellish to stand and yawn and stretch himself, and take a survey of the street before pocketing the keys of the safe and going upstairs to dinner; and when once or twice he had glanced up at the tall windows opposite and had seen the kind and smiling face looking down on him, it very soon became easy for him to watch for it and to exchange a dumb greeting with it across the separating street.

That nod and wave of the hand used to warm Mrs. Hallett's heart, and comfort her for a little ache that had taken lodgment there. Perhaps the one shadow, and that not a very sombre one, that tempered the sunshine of her life, was the fact that her brother, John Mellish, and her husband, were not the firm friends she had once believed them to be. There was no open hostility; Mr. Hallett still kept his account at the bank, and John Mellish came now and then to dine at the Red House, and sip his glass of port with the lawyer; but the old cordiality of their relations was gone.

John Mellish was somehow understood to have disappointed his brother-in-law's expectations; for one thing, he had married the wrong person, and that, as we know, is an offence we none of us forgive in a man, even if he happens to be the chief sufferer from his rashness. Mrs. Hallett, with that curious incomprehensible logic of a woman, was sorry for her brother, and perhaps even more sorry for her husband, whose dignity had been somewhat impaired by John's rash matrimonial venture.

"It was enough for him to marry me," she thought, in her humility. "John needn't have made it worse."

But her repentance towards John and her love for him went out in that mute greeting which it would have seemed to her a sort of disloyalty to omit. On this April day, when she had waited for his appearing and had seen him go, she went downstairs, as has been said, to seek Hester. On her way to the garden she looked into the dining-room, and saw that the table was duly set for dinner; her practised glance swiftly took in all

the details; she moved forward to alter the arrangement of a flower in one of the tall glasses, and finding everything else perfect, from the spotless linen to the shining silver and crystal, she opened the French window, and stepped on to the lawn.

With her fair, fresh, pleasant face, delicately framed in lavender ribbons, she was fittingly enough in harmony with the green spring world; but it was Hester who was its true incarnation.

She stood in the middle of the lawn, idle, with hanging hands and lifted head, drinking in great draughts of delight. She was tall, as every Hallett had a claim to be, and slim, even in her white dress; but she was like neither father nor mother. By some strange freak Nature seemed to have reverted to an earlier type when it fashioned Hester Hallett. Hers was perhaps a beauty that required a cultured eye to measure at its true worth. Melchisford might not know how to value the oval of her face and the pale olive of her complexion, though it could not deny the beauty of her eyes—wonderful grey eyes, with a clear light in the iris, and with a black fringe of lashes that fell straight on the cheek. Somehow she gave an impression of fragility, of apartness, of a faint hold on life. And yet Hester was not at all delicate; she could ride and walk untiringly; and though her eyes and mouth were mostly grave, and the latter pathetic in its curves, there was no happier girl in Melchisford.

She turned when she heard her mother's step, and her lips relaxed into a smile. She drew her mother's arm within her own with a gesture that anyone knowing both would have found significant.

"Mother," she said, "the daffodils by the pond are in flower; I think they must have opened in the night. Come and see them."

"Yes, dear, yes," said Mrs. Hallett, resisting faintly. "It is time for papa and Andrew to come up from the office. Papa has a meeting to-night, you remember, Hester—an important meeting. We mustn't keep them waiting."

"Then it is the daffodils who must wait," said Hester, serenely. She put up her unoccupied hand and arranged the lace on her mother's head with a deft touch.

"Mother," she said, "you are like a bit of the spring, with your soft pink cheeks and your lavender ribbons. You must always wear lavender."

### CHAPTER II.—NO RELATION.

"HERE is Andrew."

It was his mother who was the first to hear his step and to turn to meet him. While he was still at a little distance she was struck anew, as she had often been of late, with his growing likeness to his father. It might almost have been the other vanquishing Andrew of a quarter of a century back who, like the Laird of Cockpen, went forth to woo, and succeeded in his enterprise, as the hero of the ballad did not.

Andrew junior was an excellent copy—a trifle exaggerated as copies are apt to be—of what Andrew senior had been at twenty-four: his eyes and his hair were black; his nose, of the conquering type, according to Lavater, was large and shapely, and, taken in conjunction with his firm mouth and well-cut chin, gave you the impression of a tolerably inflexible will. The clear pallor of Hester's complexion was replaced in his case by a healthy reddish brown that was very becoming, on the whole, with his air of good-natured masterfulness and abundant youth and strength; and, even with his swagger and that approach towards loudness in his dress, to which his big frame and bold colouring seemed to give a sanction, Andrew junior was not unpleasant to see.

His manners had the easy confidence that comes of feeling your acknowledged superiority over your associates. It is not the ease of good breeding, but it is sometimes a fair imitation of it. Andrew had been to Cambridge and had seen something of other countries than his own. In the course of these experiences he had picked up a good deal of superficial knowledge that served him excellently in Melchisford, though possibly had this local hero been weighed in the balances of Belgravia he might have been found wanting.

In his mother's eyes, needless to say, he was perfect. He came across the lawn with a preoccupied look that did not escape her. It was not often Andrew looked so serious.

"Where is your father?" she asked, with a faint pulse of alarm.

"Been sent for," said Andrew; "we needn't wait for him. He took a glass of wine and went off at once."

Mrs. Hallett's comely face paled with a sudden anxiety. A moment is enough for the assault of so many crowding fears.

"Not—not your Uncle John?" she questioned, laying her hand on her boy's sleeve.

"Uncle John!" Andrew echoed, lifting his brows and speaking with the slightly contemptuous accent he always reserved for the banker; "what do you suppose could have happened to him? He's all right, I saw him five minutes ago at his own door."

Mrs. Hallett blushed with a meek suspicion of having been rather foolish. She, too, had seen John Mellish within the last ten minutes. Her fears set at rest, she said, with returning briskness, "Then where is your father?"

Andrew did not answer for a moment; then he said, "Old Mr. Hallett is dead."

Hester, who had taken no part in the talk, looked up with dilated eyes. Dead! Could anyone die in this beautiful young world where everything spoke of rushing, palpitating, jubilant life?

"Dear, dear," said Mrs. Hallett, "what a long ride for your father; setting off without his dinner, too."

"The old boy might have been considerate enough to put off his dying for an hour or two," said Andrew, with levity, "especially as we don't benefit by it to the extent of a brass farthing."

"Oh, poor old man," said Mrs. Hallett, with gentle rebukefulness; "I am very sorry he is dead, though he is no relation."

"I'm not so sure about that." Andrew spoke

with conviction. "I could prove the relationship fast enough if it paid to go into the thing; but, unfortunately, it isn't close enough to do us any good."

"Andrew," said Hester, speaking for the first time, "you don't want his money."

"Don't I, just!" he retorted, in lively denial. "I can tell you I do. You show me a chance of pocketing it, and you don't find me turning up my nose at it or at Hallett Place either. Fancy any man having a chance of a property like that and not wanting it!"

"But you have no chance."

"Who can tell? I'm a Hallett too."

During dinner Andrew returned more than once to this strain. He succeeded in convincing himself, if not his hearers, that he had been singularly ill-used in being defrauded of the dead man's wealth. The Halletts were not legion, as are the Smiths and the Browns. There were only the two families of them in the county, and to suggest that they were not related was both ridiculous and absurd. Possibly had old Mr. Hallett been poor and obscure, Andrew might not have been so eager to prove the tie of blood, but Hallett of Hallett Place was a name to swear by. Andrew knew that at Cambridge and elsewhere he had more than once benefited by the accident of a surname shared in common with the county magnate—it was hard, surely, that he was forbidden to claim a more substantial good.

Mrs. Hallett's anxiety was still hovering round her husband, his empty seat and half-filled glass keeping her thoughts fixed on him.

"I wish I had known papa was going," she said; "cook would have made him some sandwiches in five minutes. And his flask—did you notice if he took his flask in his pocket, Andrew?"

Andrew laughed. "One would think he was going to cross the desert!" he said. "Why, he'll be at Hallett's by nine at latest, and Mrs. Skinner will look after him. Bess is as fresh as a daisy, and will do it in three hours easily. The groom who brought the message started at two o'clock, and was here shortly after five."

"Then he died to-day?" asked Hester.

Andrew nodded. "Twelve o'clock. The man said Miss Kelynge was half distracted or he would have come off sooner. Looked as if she was by her writing; you never saw such a wriggling scrawl in your life, we could scarcely make head or tail of it at first."

"Poor thing!" said Mrs. Hallett, her compassion immediately stirred. "It must have been a great shock to her. Was the old gentleman long ill, Andrew?"

"He wasn't ill at all, so far as I can make out," said Andrew, dipping his grapes in the finger-basin. "He went out as usual after breakfast, saying he was going to look at some young trees in the plantation, and she found him there, I believe, where he had fallen. He must have died in a moment. Heart, I suppose."

Hester did not hear her mother's ready outflow of sympathy. She stared out into the garden, where the bright day was rapidly fading into a grey twilight. Dead in the full flush and glory of the morning and of the world—dead among the young trees that would live and flourish for years and years after he was dust and ashes! She had scarcely seen the old man, though she had heard of him often, and of the grand-niece who kept house for him; but his tragic end made that curious impression—half awe, half repulsion or revolt—with which the young first hear of death. By-and-by the feelings get blunted—they had need to be so in this world of dying men and women—but before the first sharp anguish of a personal loss has pierced the heart, death has always a strange unfamiliarity.

Hester thought of it when she wandered on to the dusky lawn after dinner. To make one's last surrender in a garden in the springtime, when everything else was beginning to live. Suppose it had happened here in her own green world? She glanced with a vague pang of fear at the underwood where the shadows lay deep—deep enough to hide any tragedy, to cover it close till the morning sun should pierce the green gloom and discover it. Suppose it had been someone she loved? Hester's tenderness would not allow her to shape this thought more definitely, but it woke her pity for that other girl to whom the bright day had brought sudden calamity.

"Tell me about Miss Kelynge," she said to Andrew when he joined her on the lawn, guided to her side by her white dress. "Is she quite alone?"

"There is the housekeeper, of course—she is a very good sort—and the other servants."

"But no friend of her own?"

"I don't suppose she had any friends; the old fellow lived like a hermit, and he doesn't seem to have any relations—unless you count us."

Andrew paused to light his cigar, and to nurse the little spark tenderly till it glowed.

"How sad it is for her," said Hester, softly.

"You need scarcely waste your pity, Hetty; she wouldn't thank you for it. I dare say she'll be one of the richest girls in the county. A lucky young woman, I call her."

"But there is the grandson—"

"Is there? I'd be glad to know it."

"He may be found."

"I'll lay you anything he never turns up. Why, we don't even know the name his mother went by, and our advertisements haven't brought us a single clue worth following up. As like as not he's dead. I'll back Miss Kelynge any day to win."

"I hope he will be found," said Hester, with youthful severity; "he is the right heir. Miss Kelynge could never feel happy unless she knew for certain he was not living. He would haunt her. I should think she would refuse the money."

"Well, you women are queer creatures, but that would be a pitch of disinterestedness even you could hardly reach, Hetty. And what sense would there be in refusing the money if there was nobody to claim it? I'll be bound Miss Kelynge won't be such a fool as to refuse her chance. If it hadn't been for her we might have had a try for it."

"Don't say that, Andrew"—her voice was constrained—"you make me feel—"

"Well, what do I make you feel?" he asked, with tolerant good-nature.

"I don't like to think of his money, and he just dead."

"Afraid his ghost will reproach you? It is rather ghostly out here. If I'm not to talk you must come in and sing, that's a fair bargain."

Hester yielded. For the first time there seemed to be a haunting inscrutable presence in the old garden which she did not care to face.

When Hester and Andrew had gone to bed, Mrs. Hallett carried the lamp into that front room where she was used to intercept her brother's daily greeting. All the lively bustle of the day was hushed, it was almost as quiet here as on the garden-side of the house. She put the lamp on a distant table and lifted the blind, glancing first half unconsciously across at the bank. The lights were extinguished there, and in all the neighbouring houses so far as she could see them. Melchisford adhered to a primitive simplicity of life, and was mostly abed and asleep at eleven o'clock. Probably there was scarcely another watcher in George Street but the sleepy groom who waited for his master and the policeman, whose measured step she could hear on the pavement beneath.

Being a thoughtful housekeeper, she had sent the servants to bed, and had smiled away Hester's offer of companionship. Andrew had not proposed to share his mother's watch, but he had given it as his opinion that his father would return that night.

"He'll borrow a mount over there, and leave Bess behind," he said. "Davies has orders to wait for him."

Mary Hallett had no such orders, but her service was of love. She took care to have the fire bright and a little brass kettle ready on the trivet, and she went down to the larder herself and made a selection of eatables there with a careful discrimination, remembering her husband's tastes and fancies.

When all was done that affection could devise—the slippers warming on the fender, the dressing-gown hung near the glow—she sat down to keep her vigil. No untranquil thoughts came to disturb it. She was a woman who had found life very good and sweet, whose little sheltered corner of the world had blossomed securely, who was happy in her husband and her children, whose prayers were all thanksgivings. Perhaps she lifted up her heart for them in the stillness, confiding them to a love that was even greater than her own, the children upstairs sleeping tranquilly, the husband whom every passing moment was bringing nearer home.

When she heard the triplet of his horse's hoofs on the road she ran downstairs almost with the lightness of a girl, the colour in her cheeks and a mile on her lips. She had the door wide open before the tired traveller had time to throw himself from the horse. She carried a hand-lamp, and its rays fell on her pleasant, pleased face. Surely never man had a kinder welcome!

The lawyer marked his sense of content by stooping and kissing her lifted face when he came stiffly up the steps, though he did not express any wonder at finding her there.

"Late, yes," he said, "or early, if you like. That brute of Hallett's has taken four hours to do the job. Hallett always keeps a miserable stable. I expected to find the dawn overtaking me. Well, it's a comfort to be out of the saddle."

He dropped into a chair before the fire and let her wait on him. She had begun her ministrations so long ago in their joint life that he had perhaps forgotten to be grateful for them, but she did not want his gratitude, she only wanted him to eat and drink and be comfortable. It is the best wives who make the most selfish husbands, and who in their zeal for service never know it.

She refrained from asking him any questions while he satisfied his hunger, but when he had turned round once more to the fire she said,

"It must have been a great shock for the poor young lady."

"H'm, yes," he said, absently. Then he looked up and said, decidedly,

"You must drive over there to-morrow, Mary; I told her you would come."

Mrs. Hallett flushed a little uneasily with the shrinking of a shy woman, but her habit of acquiescence in all his wishes held her from saying anything beyond—

"Do you think she will like seeing a stranger so soon?"

"Like it? why of course she will," he answered, brusquely, "the girl's alone there, without a soul to speak to and frightened to death. I called at Shepherd's on my way and found him in by good chance. He says it was a clear case of heart disease, but there must be an inquest, and Miss Kelynge must give evidence. You'd better take Hester with you when you go," he added, as if by an afterthought.

At the mention of her daughter, Mrs. Hallett found the courage to make a timid protest.

"Do you think I ought to take Hester? She is so young, and she has seen nothing of trouble—"

The lawyer looked up and drew his brows together in a little frown. It was clear he did not relish having his dictates called in question, but at sight of her anxious, troubled face his own softened and he smiled.

"You can't keep the child wrapped in cotton-wool all her life," he said; "besides, there's nothing to frighten her, and as we shall be likely to see a good deal of Miss Kelynge, Hetty and she may as well get to know each other and be friends. Shepherd and I are left sole trustees," he added, significantly.

Mrs. Hallett looked a little disturbed over this news. Her thoughts, too, flew as Hester's had done to the unknown young man who was understood to be old Mr. Hallett's heir.

"Has nothing been heard of the grandson?" she asked.

"Nothing," said the lawyer, rising, with a yawn, "and nothing ever will be heard," he added, with decision. "If he were alive he mus' have made some sign. Just as well too; one

doesn't want a fine old place to pass into the hands of a vagabond player's brat, so you may as well make yourself useful to Miss Kelynge, for this time next year she will be the owner of Hallett Place and the biggest heiress in the county."

"Still I hope the young man will appear in time—"

"Nonsense," said Mr. Hallett quite sharply annoyed, "you don't know what you are talking about. You will go to-morrow?"

"Yes, dear, of course, if you wish it," she answered, with resignation.

"Well," he dismissed the matter as settled, "I must turn in now. I have a meeting to-morrow at ten, worse luck, or you wouldn't have seen me back to-night."

### CHAPTER III.—THE NEWS TRAVELS TO TOWN.

THE spring which visits London is, as everybody knows, but a poor imitation of the same season in the country. London, which boasts that it commands the best of everything the world can supply, has for its sins to put up with the second best when it comes to be a question of the young year's bounties; but though she lavishes with a less plentiful hand, and paints her colours less freshly, Spring is generous to grey grim London too, and for a little while transforms her hoary age into a semblance of youth and liveliness and enthusiasm that cheers the hearts of the toilers there and helps them to forget the winter of their discontent.

It had this effect upon a young man who sat in an office in the heart of the City. The dull thunder of the streets was in his ears, the room where he sat vibrated at the passage of an underground train, the creak of a crane ceaselessly busy all day long hoisting bales to the upper storeys of an immense warehouse made itself heard in the momentary lull of traffic; and yet when he looked up from his desk his eyes rested on a garden where the grass was green, and the trees, nurtured in London smoke and heat, were bursting into premature leafage. And beyond the garden rose the noble bulk of the Tower massed against the sky, so that, for London, and that, too, the very core of it, the prospect was as splendid as a man could desire, and when the trees were clothed with green a little compulsion of the imagination helped one to cherish the pleasing delusion that it was the real country, not the poor semblance with which City folk have to be content.

The young man at the desk did not encourage this foolish fancy, he knew better; but it made him think of the country, which came to much the same thing, and of a garden he knew there, and of a young girl who was, no doubt, walking at that moment in its dewy freshness.

"We'll go down on Saturday," he said to himself, "Will and I, and Dot, too, if I can persuade her;" and the resolve only made his pen travel faster.

The room he sat in was very small. In the days of Queen Anne, when some sober citizen family occupied the house, it may have been used as the closet where my lady retired to meditate and do her devotions; it was still wainscoted, and the window had a wide sill where one might sit and look out upon the tranquil garden and moralise on the vicissitudes of history written for all readers on the grey walls beyond its green spaces.

The present occupier, however, had no leisure for such reflections; he wrote steadily and with diligence until the church clocks struck one, then he threw down his pen and, taking his hat from a peg behind him, left the little room and crossed a larger one which opened from it, where there were several desks, each with a busy scribe bending over it, and so made his way down the shallow staircase to the street. As senior clerk he had the privilege of going out first to dinner. He was an active young fellow, not very tall, and broader-chested than the London youth is apt to be; there was a sort of country wholesomeness and freshness about him, and his clear blue eyes were very kindly. He whistled as he went, and he took note of the bursting buds, and of the sooty sparrows, and of the look of the sky, as only a country-bred lad would do, stopping a minute to take a quick comprehensive glance of the world made suddenly young by one day of warm south wind and sunshine. He turned immediately from the square, however, and, crossing a quiet court still enclosed by ancient gates of wrought ironwork, he went upon his cheerful way dinnerwards.

As he dived downstairs to the eating-house he favoured, he jostled against another youth bent upon the same errand.

"You're before your time to-day, Tom," said the new comer, laying a hand on our acquaintance's shoulder, "five minutes."

"I should say you are after yours," answered Tom, brightly, pulling out his watch; "I didn't slack off till the clock struck; and don't I always find you at our special table, keeping my corner for me?"

"Well, come along, or we'll find ourselves elbowed out. This is pudding day."

The eating-house they patronised is famous for its beefsteak pudding, served as part of the *menu* on certain days of the week, and the clerking world flocks to it in vast numbers when the turn of this favourite dish comes round. Beefsteak pudding is savoury and it is satisfying, two qualities that are of importance where the appetite is large and the purse small, as both are apt to be in the region where the lesser clerk abounds. Our pair of friends, by long established usage and the employment of a judiciously administered tip, had secured a tacit right to a table that only held two people, and was conveniently hidden in a corner where you had room to stretch your legs and spread your arms without inconveniencing anyone else; and here they held a daily tryst, he who arrived first guarding the vacant seat for his comrade. As they shared lodgings, and spent their evenings, their Saturday afternoons, their Sundays, as well as all bank holidays, in each other's company, one would have thought they would have had enough

of each other's society without this middle-day meeting as well; but in the twenties friendship is a generous thing; it can stand a tolerable strain when it is of the right sort, as it was in the case of our Damon and Pythias, who were both very good fellows; indeed, there is no such thing as real friendship possible where a man isn't a good fellow. Mean men and knaves never make friends.

"Will," said Tom, when they were seated at their own particular corner, and each had silently worked his way through his slab of pudding, "what do you say to a week's end in the country —Saturday to Monday?"

"Can't be done," said the young man addressed as Will, and who signed himself Wilfred Somers. He was dark and tall, a contrast to his friend, and his mode of speech was swift and abrupt.

"Why not?" Tom leaned an elbow on the table and spoke eagerly, his blue eyes shining—he was always an eager fellow. "The doctor can put us both up at a pinch, and you know how awfully glad he always is to see us."

"I know how sarcastic he can be."

"Oh, that's his way, it means nothing; there is no better man breathing, as I should know. Think of it, a whole peaceful Sunday in the clear air: St. Peter's in the morning, Hester's garden in the afternoon, or a spin to Chalk End if you like that better." He smiled as if there were some reason to doubt this preference.

"And where is the tin to come from? That river trip cleaned me out."

"I can manage the funds, if that's all," said Tom, cheerfully. "It's only a question of bread and cheese minus beef for a day or two; and, by the way, if we're to go we'd better pull up now—" He stopped short suddenly. The obliging waiter who made these two young men his particular care had brought a copy of the morning's paper with the knives and forks, the bread and the ale, as a delicate additional attention on his part, and Tom, glancing carelessly at it as he spoke, had had his attention arrested by a name he saw there.

"What is it?" asked Somers, stirred to curiosity by this pause. "Anybody dead?"

"Old Hallett, of Hallett Place." Tom was still staring at the announcement. "It must have been unexpected, it says suddenly"—he glanced at the date on the top of the sheet—"it only happened yesterday."

"You country people have immoderate expectations, it seems to me," said Somers; "the old man must have been eighty if he was a day; that's a tolerable lease of life, and yet you talk as if his death was a thing to resent."

"It is a thing to deplore, Will. Remember the heir is not found yet."

"Then somebody or something will benefit. It's an ill wind that blows nobody good."

"I should like to find that fellow," said Tom, meditatively, "for the justice of the thing; also, it would be queer to see how he took the change of fortune, and how he turned out under it. It's an experiment one would like to watch."

"It's an experiment that would very likely end in a big failure. Set a beggar on horseback and you know what road he'll take."

Somers liked to strengthen his argument with proverbial philosophy.

"You don't know that he is a beggar."

"You don't know that he's anything else. Besides, if he has been decently brought up where would your experiment be? You don't know, for the matter of that, that he exists. It's all a toss up; it seems to me that any impostor who chose to set up a claim would have a fair chance of success. I wonder nobody has tried it, I wonder you don't try it on, Tom. Couldn't you work it? You're a Melchisford man, or as good as—"

"But that doesn't make me an impostor, I hope," said Tom, with his pleasant laugh. "It is true that I don't know much about my people, but that scarcely gives me a claim—"

"You are sure, Tom," said his friend, leaning across the table and speaking earnestly—"you're sure Rose has told you the truth? You bear his name and he calls you cousin; but when a man has a hobby, a fad, call it what you will, he is apt to twist circumstances to fit it. Rose had a theory to work out when he adopted you—you've told me that, and he makes no secret of it."

"No," said Tom, simply, "he believes in education being strong enough to counteract hereditary influences. My father was not all that a man might wish his unknown father to be—the doctor has never concealed this from me, though he hasn't entered into particulars and—and I haven't pressed him." Tom hung his head a moment, but he raised it the next. "If I've escaped similar temptations, I owe it all to one man's generosity. You know what he has done for me, Will, and what I might have been and must have been without him, but he has never shirked the truth. If I had a right to old Hallett's money, or to anyone else's money, he would very likely have advised me to waive my claim—he is no believer in inherited wealth, as you know—but he wouldn't have kept me in the dark; he would have told me the truth as you would have told it me, Will."

"Well, I shouldn't have advised you to let the fortune slide; on the contrary, I should have bid you stick to it, and helped you to spend it; you would have had to choose between Rose the social democrat, and Will the man of common-sense."

"I'll never be called on to make the decision." Tom laughed. "But you see there's a sort of likeness in our circumstances that makes me take a kind of brotherly interest in this son of Avisia Hallett for whom everybody is searching. I've half a mind to join in the hunt too."

"Much better let him be. Lost people should never turn up again, nor should people who emigrate ever come back to their native shores; their places are filled up, there's no such thing in this crowded world as keeping a man's old niche empty for him. The same thing would hold good with the dead if they could revisit their old haunts, only fortunately they can't or don't."

"I should like to think that I left some kind of memory behind me in one or two people's likings," said Tom, modestly; "in yours, for instance—"

"Oh, we'd miss you, Dot and I; we'd wear sackcloth and ashes for you, and Dot would cry her eyes blind and go widowed all her days; but if we survived you long enough I suppose the time would come when we felt that we could still live and eat, and even laugh without you. But this lost man has made no place for himself; nobody in Melchisford misses him or mourns him, or cares a hang for him—he is only interesting while he remains a mystery, and my serious advice to him is to continue lost."

But Tom's thoughts had taken a new turn at the mention of Dot—not the Dot of Will's tragic picture, all crape and tears, but the real Dot—the little, round, soft bright-eyed Dot. Tom's face cleared into sunshine.

"Will," he said, "Dot must go with us; we must manage it somehow. She can stop at the Red House. It won't be half a holiday without Dot."

Will shook his head.

"If you can screw another outing out of the flinty-hearted lady principal you are a cleverer fellow than I take you to be, Tom."

"It's no use my attempting it," said Tom, with dejection; "they draw the line at brothers. If I had your chances—"

"Well, I don't suppose you exactly want to be Dot's brother?" said Somers, with a faint inflection of sarcasm.

Tom laughed. "Well, old man, you'll do your best for us; use all your arts and blandishments on the old lady, and get her on our side. Why, if we had Dot with us it would be—"

He apparently found no metaphor sufficiently worthy the occasion, and time being now up, and the other clerks very likely growling at his absence and hungrily scenting the beefsteak pudding from afar, he had to leave the sentence incomplete. When a young fellow falls to thinking of the girl whom he hopes to make his wife, for whom he is working and saving, with that vision of a home in the future to keep him at his highest and his best, he may be excused if he forgets for a moment the claims of his neighbour. With Tom remembrance and remorse were never long delayed, and he set off now at a pace that spoke equally well for his heart, his lungs, and his digestion. At twenty-five many things may be done with impunity, even to running at the top of one's speed immediately after dinner.

Dot was Will's only sister, and she was resident governess at a boarding-school in Bayswater. The position sounds important and imposing, especially if you speak of the school, as the Principal of it always did, as a Seminary for the Daughters of Gentlemen; but it has its drawbacks. It means a good deal of hard work for very little pay and a great many snubs, and it calls for a quite angelic amount of patience, tact, and temper to fulfil its duties properly. Dot was not an angel, perhaps, but she was a bright and brave girl, and a very sensible little woman as well. Her good sense led her to see the impracticability of Will's proposal at once, for Will honestly did his best to be Tom's ambassador.

"What, two holidays in a month?" she said, raising her pretty brows. "Will, you are an unreasonable man."

"It's Tom," said Will, basely.

"Then Tom is unreasonable too," said Dot, with a smile creeping into her brown eyes; "why there would be a revolution, a mutiny in the bedroom; the girls would smuggle in novels and read in bed—I know that Jemima Cubitt has a store of candle-ends hidden among her clothes; they might even get up and eat buns and make chocolate over the gas."

"I don't see much fun in that."

"The fun would lie in its being forbidden. You see I'm much too important to be spared. I represent discipline, and order, and rule, and regulation—it sounds grand, doesn't it?"

"It sounds absurd; you couldn't frighten a mouse."

"Ah, but you don't know what the governess in me is capable of. That bell is for me; it means that I must go downstairs and cut bread-and-butter, and pour out cups of tea, and I can't ask you to go with me, my poor Will; other people's brothers are forbidden, you know, or else—or else Tom might come with you sometimes. But I'll see you both on Sunday week—my day out, and you must take me to Westminster Abbey. There, Will, dear, I must send you away, I really must."

But before this there was time to tell Dot of the old man's death down at Melchisford, and she, too, was full of wonder over the lost heir.

"Tom wants to find him," said Will, with a grin.

"That would be splendid," cried Dot, seeing no absurdity in the proposal. "Oh, you must both of you do your best; you have a whole year for the search, and that is a long, long time. And he ought to be found, he is the right man. Hester would like it, she has always wanted him to be found."

Will had humour enough to laugh as he kissed her and went his way.

"Tom is in a corn-merchant's office, and I'm a stockbroker's clerk; we're six-hundred-dollar clerks, and our joint screw does little more than keep us, and yet we've to find the clue that has baffled the whole machinery of the law."

He laughed aloud when he had got safely out of reach of the principal's ears, and yet Dot's last words lingered in his thoughts and coloured them. "Hester would like it." Viewed in the light of Hester's likings the scheme did not seem quite so preposterous, it even seemed the sort of enterprise that a young man who wished to please somebody very much might undertake.

### CHAPTER IV.—SISTERS-IN-LAW.

IF Mary Hallett liked to refresh herself in the midst of her many home duties with an occasional peep at the mild bustle of George Street, Hannah Mellish at the bank-house opposite devoted a large part of her leisure to the same spectacle.

She brought to the town the same habits of early rising she had practised on her brother's farm. Before a single blind was drawn up at the Red House opposite she had her morning's task well in hand, and was able to give some of her superfluous energy to the observation of her neighbours. Any day, wet or dry, you might have seen her spare figure outlined in the centre window of the three that lit the bank drawing-room, the lace curtain carefully tucked aside that no detail might be lost, her elbow resting on the sill, her sharp chin supported by a thin brown hand, her eyes fixed on the panorama without.

So she would remain for hours, scarcely varying her position. Of what did she think? Probably she did not think at all; she noted, observed, compared, chronicled, but she did not reason. At best, she fed a curiosity that had been starved in the country—the country wide, lonely, untenanted, barren of event, as it is only to be found round Melchisford. For an unstored mind there is no duller county in England than Eastshire.

There are people to whom life is mainly processional—who live by the senses, and who find sufficient entertainment in the exercise of their eyes, while such thinking faculties as they possess lie dormant. Hannah Mellish was one of these. Nothing escaped the unwinking gaze of her black eyes. Her field of observation was limited, it is true, by the drapery business that flanked one side of the lawyer's house, and by the grocer's on the other beyond the stable entrance; but this narrow range, this *genre* picture, seemed to satisfy her. It afforded her a continually varying entertainment that to her rusticity seemed rich in incident.

She saw the customers who came in and out of Barker's—those of them who paused to take a preliminary survey of the attractions displayed in the windows, and those who went in at once, emboldened by the consciousness of a commission for a yard of ribbon at twopence-halfpenny. She could have told almost to an ounce what groceries Mr. Cheeseman supplied to his various clients, and which of them bought the tea at three-and-sixpence and which was content with an inferior brand.

It may be said in excuse for this unflagging scrutiny that the bustle of the little country town was a comparatively new experience to her; it was not home as it was to Mary Hallett, where every face was that of a friend. It was only on market days that Mrs. John Mellish could claim a large acquaintance in Melchisford, for she had lived upon her brother's farm until, a year or two before this chronicle opens, John Mellish had transplanted her to the bank-house.

It was this marriage that had so offended the lawyer's susceptibility, and had even made gentle Mary blush for her brother.

"A bankrupt farmer's daughter and sister—a woman without an idea in her head beyond the milking of a cow and the scrubbing of a floor, when he might have had a Carter for the asking!"

"She is pretty, and that is what you can't call Bethia Carter," said Mrs. Hallett, in instinctive defence of her brother.

"Pretty!" cried the lawyer, in accents of disdain, as if beauty counted for nothing in a man's choice of a wife; "it would have been more to the purpose if she had had a little money, John could do with a little ready cash or I'm mistaken. He put a millstone round his neck when he married a Moss!"

Mary Hallett was silenced. Hannah's small-featured, red-cheeked beauty, though it was vivid enough in its way, was not of sufficient importance to counterbalance her many disadvantages. She was not a lady even according to the Melchisford standard, which was indulgently unexacting, and society there was scarcely cordial to the little woman. She was dowerless, and, what was much more serious, she had a whole troop of impecunious relations, to whom she clung with a loyalty that Mary Hallett would have found admirable had anyone but her brother been the victim who had to suffer for it.

It was, however, precisely towards the Red House and its doings that Hannah's glances were oftenest turned; it was in this direction that her curiosity became vital. They were near relations over there, though she asked or expected nothing of them. She looked to see who came and went up the steps and in and out of the office; she took pleasure in knowing what the Halletts were having for dinner, and in observing in what direction her sister-in-law and niece took their walks when they went abroad. She was not a gossip, she did not retail her information, she acquired it simply for her own satisfaction. If it had been her lot to live in London she would have bought a directory and made it her business to know the names of all the occupants of the street, in the same way that she made a duty of mastering the advertisements in the "Melchisford Chronicle." The kind of intelligence that goes out in such exercises is not of the highest order perhaps, but it has its uses.

"If the parish registers happened to get burned she could supply the dates of the births, marriages, and deaths for a quarter of a century at least," John Mellish would say, half laughing, half admiring this gift in his little companion.

John Mellish was satisfied, whoever might object; he did not covet a clever woman who would want to be managing the bank for him, nor a fine lady to be spending his money in fashions and folly.

Hannah, indeed, had no expensive tastes, unless that passion for helping her relations might be classed as extravagance, and she was aware, without Melchisford requiring to impress it on her, that she was not a lady. On the whole the banker might have done less wisely, even if he had aspired to a Carter.

On the morning after the lawyer's return from Hallett Place, Mrs. Mellish was seated at her usual post. The house was scrupulously clean, the dinner determined on, Mr. Mellish's stockings darned, the Moss contingent from the farm not due till twelve o'clock. It was with a conscience void of power to offend that she took her accustomed place and prepared to enjoy herself in her own way. She had not been seated many minutes, however, when, with unusual precipitation, she

rose, crossed the room, and ran downstairs. Her resolution seemed to falter at the outer door, but she gave herself a little shake, and, picking up an umbrella from the stand in the hall, opened it, and crossed the street.

The brougham, which Mr. Hallett held necessary to his wife's state, had been pulled out into the yard, where it stood with empty shafts while Davies, the old groom, went about certain leisurely preparations before yoking. In the midst of these recollection occurred to her that gave her fancy a spur.

"When do you start?" she asked.

Davies scratched his head and looked at her consideringly. In his opinion there was a point beyond which feminine curiosity ought not to be encouraged.

"You'd better ask the missus," he said; "hinder she b'is." He pointed with a backward thumb to the garden beyond the yard.

'YOU'D BETTER ASK THE MISSUS," HE SAID.

he was startled by hearing a voice at his elbow, and turning clumsily round he encountered the questioning glance of Mrs. John Mellish.

"Where are you going to-day, Davies?" she asked.

"We be going Brumf'l way—the missus and Miss Hester," he answered, after a moment given to consideration of the question. "The old gentleman over there be dead."

Mrs. John Mellish nodded. She had heard that item of news at breakfast-time, when her husband had been full of it. She had scarcely seen old Mr. Hallett; indeed, he was almost as removed from her sphere as a prince of the blood, and the fact of his death had but faintly interested her. Her imagination required the stimulus of sight before it could work. Suddenly, however, a

Hannah turned away, not at all abashed by the rebuke of this rejoinder. The manners of Chalk End had not made her supersensitive.

"I will go in by the kitchen-garden door," she said, having, indeed, the fear of her brother-in-law to withhold her from returning on her steps to seek the legitimate entrance, since to do so she must pass the window of his private room.

A little door in the high red-brick wall led to the kitchen garden. An almond-tree headed the procession of the spring with the bravery of its pink blossom, which it flung across the path, but Hannah did not notice it. She plucked a leaf of the flowering currant, however, and crushed it in her hand. The strong pungent scent woke an association in her mind, as odours so often do, and she quickened her pace.

Her sister-in-law was nowhere visible. She passed from the kitchen garden to the yew-tree walk, and so across the lawn to the open window of a room that seemed to her first glance untenanted.

Mary Hallett was there, however; she had dressed herself so early for her drive that she had left herself without occupation except to forecast all the details of the coming interview. She shrank from it with the sensitiveness of a shy woman who feels that she may be possibly unwelcome. Miss Kelynge might resent her offered condolence, she might even think she had come to press that claim of kinship on which Andrew had based so many jests. At the mere supposition the colour rose warm in her cheeks—she had the self-respecting pride of the middle-class, as inflexible in its way as that of the old man who had died a day ago.

When she heard a step on the gravel without, she looked up.

"Hester," she said, "Hester, do you think—"

Then she saw that it was not Hester, but Hannah Mellish. Mrs. Hallett, who was tall and gracefully proportioned, looked down with half-startled surprise at the little figure, smaller, skimpier than ever in her plain morning dress, her hair tightly braided and drawn from the temples without a thought of becomingness. Mrs. Hallett took in all these details in the same breath with which she exclaimed—

"Hannah! I hope nothing is the matter?"

"No," said Hannah, abruptly. "Davies told me"—she gave a backward wave of the cotton umbrella which she had closed—"you were going over to Hallett Place, and I thought if you wasn't in a great hurry to set off, you would take Lavy Moss. She'll be here by twelve."

"Lavy Moss?" said Mrs. Hallett, who found this a most bewildering request. "But it would scarcely help her at all. We are not going by Broomfield, the road is so bad, and Chalk End is four miles from Hallett Place."

"I mean will you take her to Hallett's?"

The amendment scarcely helped Mrs. Hallett's bewilderment.

"You know of course that old Mr. Hallett is dead?"

Hannah nodded.

"We are going to call—Hester and I—because my husband wishes it. He is the family lawyer, and everything is left in his hands, and he thinks we might perhaps be of use to Miss Kelynge; but it will be a very painful visit—I don't know the young lady—neither Hester nor I have ever met her—"

"Lavy knows her—she's a friend of hers. She'll be wild to go to her when she hears the old man is dead. She has been at Burgess's all night, and she won't know till she comes into Melchisford with the second milk cart."

This explanation traversing Mary Hallett's halting phrases gave her something of a shock. Lavy Moss—one of those dreadful girls with the rough heads and the loud tongues, who were always rushing in and out of the bank-house—a friend of Miss Kelynge's? It was incredible, inconceivable; the mother who had feared affront for her own gentle Hester refused to give credence to this wild story.

She looked at her sister-in-law, and Hannah returned the look with the unwinking gaze of her bright black eyes.

"It's true," she said, not at all resenting the doubt written so plainly on the other's face, "and if you would give her a lift—"

"I must ask my husband," said Mary, shrinking back a little. "We have only one horse to-day, and I am afraid he will say we are too many for the long distance."

She faltered and flushed over the words. She knew that her husband would not couch his refusal in terms that were nearly so polite, and she was certain he would refuse. Perhaps Hannah knew it too; she stood in dumb acquiescence outside the window waiting her sister-in-law's return; she leaned her slight weight on her umbrella, but she remained quite immovable, except for the quick, bright glances of her eyes.

Mary Hallett came back presently with a heightened colour and something of a shame-faced air. She felt she had been rather cowardly. It would have been braver to tell Hannah herself that she could not comply with this request than to hide behind her husband's authority. She did so now without further ado.

"I am sorry, Hannah," she said, "but I cannot take your niece to-day."

The lawyer's message was indeed quite untranslatable. He had been angry with his wife for supposing for a moment that he could permit such a grace to a Moss.

"What business has that woman to come here with her white stockings and her cotton umbrella and nothing on her head, poking about the stables and gossiping with Davies? It's not respectable—and to walk into my house by the garden! I won't have it; you must put a stop to it, Mary. As to Moss's girl, I daresay she does go to Hallett Place, to sell milk and eggs. If you don't know better than to decline her company I must do it for you."

"I told her I didn't think there would be room," said Mary, with anxious haste repudiating this offered help.

"Well, if she needs to be told again, send her to me," said the lawyer, grimly; "and look here, Mary"—he took advantage of her humiliation to impose a new condition—"you may as well try to persuade Miss Kelynge to come back with you. Tell her that Andrew or I will be over there every day, and that she shall be sent or taken over as often as she likes, but she ought not to sleep there alone. If my wife and daughter"—he drew himself up and puffed out his chest—"show a proper spirit of kindness to the poor young lady, I don't doubt she will prefer their society to that of Miss Moss."

"I will do all you wish, Andrew," said Mary, going away meekly, but she had a stronger distaste than ever for the mission.

"I don't like it at all," she said to her daughter, as they rolled away together in the brougham,

"the having to refuse your Aunt Mellish. Not that she said anything; if she had been angry it would have been easier; she just went away saying nothing."

"I don't think Aunt Mellish is very readily made angry," said Hester.

"Uncle John may think it unkind," she sighed, "but I couldn't help it. Think of Lavy Moss here beside us—" She gave a little shudder. "Why, we couldn't have talked comfortably at all. Oh, Hetty!"—she unrolled the last of her burdens—"suppose it should be true after all that she is a friend of Miss Kelynge's?"

Hester looked round and smiled. She wore a cool grey dress, and she looked calm, and serene, and beautiful as the day. She put her hand on her mother's.

"Perhaps it is true. Miss Kelynge must have been often very lonely in that big house, and with a sort of Bluebeard for an uncle, and I daresay she was glad of another girl to speak to. And don't you think, mother, if she's like that—frank, and not formidable or stuck-up—it will make it easier for us?"

"She can't be stuck-up, Hetty, as you say, if she takes to a Moss."

Mrs. Hallett shook her head, but she took the reviving comfort to her heart.

"We must do the best we can to please papa," she said. "You know he wants her to return with us?"

"Yes, but I daresay she won't come just yet. I don't think I should if I were she. Mother," she went on, after a little while, "tell me all you know about old Mr. Hallett and his grandniece and the young fellow for whom papa is seeking. He is the most interesting; tell me all about him."

"There is nothing to tell about him—nobody knows anything. I asked your father last night, and he says he feels confident nothing ever will be known. It all happened such a long time ago, and he thinks he must be dead."

"That seems very sad," said Hester, gravely.

## The Hours.

THE rapid hours, the varied hours,
How swiftly move their tireless feet!
And some are crowned with fairest flowers,
And some are sad, and some are sweet.

Some bring the shadows and the night,
Or narrow days which sunless show;
While others, zoned in rosy light,
Nothing but summer joyance know.

Anon with heavy tread they come—
For grief is theirs, and bitterness,
The long slow hours which bear the sum
Of life's large burden of distress;

Wrapped round in sackcloth of remorse;
Or diademed with thorny pain;
Or fired with some unhallowed force,
Mad passion, or the lust of gain.

Now bathed in love's immortal rays,
The circling throng too quickly pass;
And now they wing the shaft which lays
Loving and loved beneath the grass.

Thus round the earth the rapid hours
For ever urge their tireless feet;
And some are crowned with fairest flowers,
And some are sad, and some are sweet.

SYDNEY GREY.

# THE SOVEREIGNS OF EUROPE.

HISTORY has ceased to be written in the names of kings and princes. The Victorian age is itself an illustration of how men of every grade combine in diversity of action to make a great era. It is therefore in no spirit of adulation that we commence these papers. "The divinity that doth hedge a king" is a sentiment superannuated in these post-revolutionary days, when the deeds of men, be they princes or paupers, are weighed upon the same balance and judged by the same standards. Still, the crowned heads of Europe are potentates, the measure of their influence is not defined by the letter of constitutions; and while men have learned to recognise that history includes the masses, and does not mean merely the deeds or misdeeds of a few prominent persons born into a certain position, kings continue to play a large part in making the story of their times. It is with a view to enabling the general public better to know the men who hold the reins of office, and hence better to appreciate the course of modern politics, that this series is planned. The biographies we propose will be in their degree chapters of contemporary history. They will be carefully prepared from special and authoritative sources, and while we shall speak with the reserve due to individual privacy, we shall also speak with the fulness truth requires for the proper understanding of character. Of these Sovereigns of Europe, it will generally be found, to their honour, and especially among the younger generation, that most of them are penetrated with the gravity of their responsibilities, and strive to do their duties according to their lights, even though of some of them the lights are at times but dim.

## WILLIAM II,

### THE GERMAN EMPEROR.

IN the latter days of January, 1859, Berlin was on tiptoe of expectation. The Princess Frederick William was about to give birth to a child, and for Prussia, where the Salic law still obtains, the sex of that child was a matter of vital importance. As is usual at the birth of royal scions, one hundred and one guns announce the birth of a prince, twenty-one that of a princess. In those days, therefore, whenever and wherever firing was heard in Berlin—and when is it not heard in that military capital?—people steadily began to count the discharges. On the morning of the 27th a shoemaker's boy heard cannon firing. At once he set to work to count one, two, three, up to nineteen, then the guns stopped. "What, not even a girl!" he exclaimed, in disgust, unaware that he had merely listened to artillery practice. But a little later, at four in the afternoon, the cannon boomed and thundered so that all Berlin could hear their hundred and one reports, and from the palace chapel bells resounded the chimes, "Praise the Lord, the mighty King of Hosts."

William I, then acting Regent for his deranged brother, Frederick William IV, heard the cannon also while busy in the Foreign Office. He jumped into the first cab that crossed his path, too impatient to wait for his carriage, and hurried to his son's abode. As he entered the courtyard Field-Marshal Wrangel left the house.

"Your Excellency, how is it?" demanded the eager populace of its favourite general.

"Children," he answered, "all is well; it is as fine and sturdy a recruit as we could wish."

Thus William II—for it was he whose advent had caused this commotion—was from his birth dedicated to the army—as indeed, for the matter of that, is every Prussian prince and every Prussian citizen, for, as Mirabeau well remarked, "War is the national industry of Prussia." Prussia is not a country that has an army, but an army that has a country.

And yet Prince William of Prussia was near being precluded from a military career—perhaps even from the throne, if that be true which the Court party industriously tried to circulate at the time of the Emperor Frederick's illness, namely, that according to Hohenzollern family law no member who was infirm in mind or body might succeed to the throne. The Princess Frederick William had a difficult and dangerous confinement; an accident happened which might have cost her her life. She was to be attended by Dr. Martin, as well as by her own household doctor. About 8 a.m. the latter wrote to Dr. Martin to say his services were required immediately, but the servant to whom the letter was entrusted, instead of taking it, put it into the post; the consequence was that it never reached Dr. Martin till after 1 p.m., and when he arrived at the palace he found it was too late to do what ought to have been done hours before. For some time the Princess's life was despaired of, and when the child was born a slight injury was inflicted on the left arm, which appeared withered from below the elbow.

Time, science, and a strenuous determination on the Prince's own part to conquer this defect, have minimised greatly the inconveniences of this

imperfection, and only on close examination is it possible to perceive that the present German Emperor has not the equal use of both his arms. Little incidents like that of his dropping his helmet at the feet of the Pope alone recall that he has not equal strength in his right and left hands.

This defect, trifling though it is, has had, however, a very marked influence upon the Emperor's character, as well as on his mode of thought. To this those who know him well have ascribed his pronounced dislike to all that is English, though his mother was English in heart and by birth, and his father, too, professed great admiration for the freer political institutions of Great Britain, and had become much anglicised. For English doctors and nurses had, at Queen Victoria's wish, attended the birth of this her first grandchild, and nothing —it has been alleged—could persuade the present Emperor but that a clumsiness on their part was the cause of the physical weakness which troubled his earlier life.

Neither could any moral suasion move him. Resolute obstinacy is the keynote of his character, and is its mainspring for good as well as for evil. Nor is this quality to be wondered at if we examine his ancestry. He is the offspring on the one hand of a family in whom hereditary energy is apt to turn into stubbornness, and on the other of the Hohenzollerns, in whom self-will and self-esteem are prominent features—features only redeemed from unlovableness by a dash of idealism, a strenuous sense of rectitude and honour. It is this that has made the Hohenzollerns great, this that has made them feared and respected, this that has caused an obscure Pomeranian family to subjugate under its heel the whole of Germany, and to take upon its shoulders what was once the Holy Roman Empire.

The present German Emperor is born on the paternal side of a family characteristically and traditionally national, a successful race, that enriched and elevated itself with astonishing rapidity, though at times by methods which do not perhaps bear too close an examination, and that lacked the art to endear itself to the nations around. His grandfather had done much by sheer dint of living beyond the appointed span of man to convert himself from a despised and insignificant person into a picturesque and remarkable figure. Part, not to say almost all, of his great popularity was due to the events of his reign and the sudden rise of his country, whilst under his sway, into a dominating and imperial power, as also to the group of great statesmen and generals whom he had the good fortune to gather round him. His son Frederick William, with his genial and gracious manner, his native kindness of look and

THE GERMAN EMPEROR.

*After a Photograph by J. C. Schaarwächter, Photographer to the Emperor.*

word, his real sentiment, was to a certain extent a spurious plant that did not take after its kind, and of which his own family did not know what to make. His son was again to prove true to tradition. It may be said that from his birth the little William gave evidence of one of those strongly pronounced individualities which no outward circumstances seem able to alter or to mould, and which are wholly unaffected by even the mightiest outer influences—a curious crystallised unit which maintained itself intact throughout all phases of its development, in all the natural metamorphoses of the human being. This strength of resistance to transmutation made itself felt very early, and surprised the observer in this very pretty, almost girlish-looking, boy, whose delicacy was heightened to weakness through the awkward impotence of his left arm. The slightest attempt to exert pressure from without at once provoked a firm opposition.

Naturally, the etiquette that rules in princely families, and is especially rigid in Prussia, made it easy to mould the outer life and behaviour of this scion into prescribed forms, and to force upon him habits, and even abilities, that were naturally distasteful to him; as, for example, politeness of speech and bearing, knightly exercises, and the learning of foreign tongues. All these it was possible to impose on him, as neither physical nor intellectual resources were lacking; and the need of obedience to outer discipline was quickly recognised as an inevitable necessity by his cool reflective faculties. Here he was helped by the eagerness to do his duty that is a heritage from his Prussian ancestors. But while it was a comparatively easy task to impose upon Prince William these external qualities, it was more hard to attain a hold upon his inner nature, and to bend its evolution into a given groove. This stubborn nature resented intensely the mere discipline of thinking.

Royal children suffer much from the superabundance of impressions and emotions that pour in upon them from all sides, and this is apt to produce the pernicious result of a certain desultoriness of thought and a precocious weariness of pleasure. It has been justly remarked that to conquer this disastrous lack of power of concentration is ever the most important task of the tutor of princes. This office was specially onerous in the case of so intractable a nature. Only the greatest severity and the energetic cooperation of all concurring authorities were able to conquer this mute intuitive resistance, until the hour struck when perception was awakened. Then his own will came to the rescue, after which all difficulties were overcome. But even then, while doing what was required of him, the inner nature of the Prince remained untouched and uninfluenced, developing in its own manner, modified and directed by outer influences, but never fundamentally changed or varied. From his mother he has inherited a portion of her love for the fine arts, and some of her ability of pictorial execution; from his liberal bourgeois father an interest for other classes than the merely aristocratic, though in his case it has never approached the father's freedom from class prejudices and from the Hohenzollern tendency to overbearing. From his earliest tutor he has imbibed a love of discussion. Yet not one of these supreme authorities could give the child, the boy, or the youth the full impress of their character. There were moments when it seemed as though they might succeed, and many false hopes were based on such passing phases; much bitter disappointment was aroused when it was once more made evident that this nature remained in change unchanged.

We have, however, anticipated a little, and must return to March 5th, 1859, when the baptism of the new-born boy took place with great pomp in the Royal Palace of Berlin, emperors and kings, princes and archdukes, queens, princesses, archduchesses and duchesses standing sponsors to this latest scion of the stalwart house of Hohenzollern, who received at this ceremony the names of Frederick William Victor Albert.

From the first his parents, though still so young, felt the solemn nature of the great task laid upon them of educating this child aright for the high station that promised to await him, though in those days it was no higher than that of King of Prussia. The Princess, a worthy daughter of her father—of whom, indeed, she was the favourite—had been reared in his upright views as to the duties of royalty, and the obligations which pertain to the education of its children, and with these sentiments she had also imbued her husband, who was devoted to her, and willingly let himself be led to higher wisdom by her wise hand.

The couple in those days lived like two quiet burghers, having but a few rooms in a tower of the Castle of Babelsberg, near Potsdam, or in a wing of the Berlin Castle. Their modest establishment, their simplicity of living, their high mode of thinking, their keen intellectual interests, were the wonder, the stock theme of talk, the derision of one-half of Berlin, and the admiration of the other. Not till their little son was born was a house of their own assigned to them. After this event they went to live at the New Palace of Potsdam, rechristened Friedrichskron during the brief reign of the Emperor Frederick, in memory of his great ancestor Frederick the Great, who had built this vast, pretentious pile at the conclusion of the Seven Years' War in order to prove to his enemies that war had not exhausted his pecuniary resources, and that if need be he could go to war again. On the cupola that crowns the centre of this rococo building are enthroned three female genii. Popular tradition designates them as Frederick's three mortal enemies—the Empress Maria Theresa of Austria, Elizabeth of Russia, and the notorious Madame de Pompadour. Over the cornice is placed the Prussian eagle, with the audacious motto, "Nec soli cedit."

To this palace, to this suburb of Berlin, distant from it some half hour by rail, and containing in its small area the only sheets of water, the only woods and scenic features the arid Berlin sand-wastes can produce, there came to live, early in 1859, the little family of Prince Frederick William of Prussia.

He himself loved Potsdam, as all his ancestors had done, and had a special liking for this huge house, with its two hundred rooms, its quaint theatre, its reminiscences of the greatest of Prussia's kings, its spurious pictures of the Bolognese and Venetian school, for in this block he had himself first seen the light of day. It was here, too, that he had conceived his admiration for his great ancestor, so that one of his first acts was to see that every memory of him should remain intact. Thus, for example, the workroom of the "Old Fritz,"[1] as the Berliners ever called this sovereign, was carefully guarded.

Little Prince William grew up in this atmosphere of enthusiasm for his great forefather. No wonder he caught the infection also, no wonder that his highest ideal and aim is to be a second Frederick the Great. But it is not so easy to be "Old Fritz" at the end of the nineteenth century as in the middle of the eighteenth; other elements of character are required by the changed moral conditions. The manners and modes of thought of the barrack-room have been replaced by more refined and nobler aims; men know now that there is something higher and finer in the world than mere brute force. As founder of a kingdom, Frederick the Great receives all praise; in an example to be followed in order to maintain that kingdom, there are other qualities required. The Emperor Frederick's admiration for Frederick the Great was for the founder of his dynasty; his son's is for the military despot, the man who ground his heel remorselessly upon whatever stood in his path. These are two very divergent matters. Still, this hero-worship was one of the few interests father and son had in common in later life, when their views and ideals had grown widely apart; and it is pleasant to learn that among the last gifts exchanged between Berlin and San Remo that sad Christmas of 1887 were some relics of "Old Fritz," unearthed by his young descendant.

In the New Palace of Potsdam, therefore, amid these memories of Prussia's first glory, was passed the childhood of Prince William, and of his brothers and sisters, for the Princess Frederick William followed her mother's example, and the house filled rapidly with little people. To rear these young ones carefully, to make them strong in mind and body, was the Princess's one care and consideration. After much anxious thought and discussion between the father and mother, it was resolved to aim very high, and to try by every means available to attain the goal. The native and inherited seriousness of both parents made this task comparatively easy. It was also resolved between them—to the no small scandal of the grandfather, who clung with vehement preference to old tradition—that in the case of these royal children class traditions should, above all, be broken down, that they should have as far as possible a simple burgher training, and that the civil element should equalise, if not preponderate over, the military—until then alone held in esteem in the Prussian royal house. The purpose of the parents was that their children should profit by the mistakes made in their own education, and no mistake seemed to them so great, so fatal for a ruler who should understand all classes of his people, as the rigid and artificial isolation in which royal people are usually reared. Subversive ideas truly, and which were to draw down upon those who promulgated them—and especially upon the mother, the more defenceless person—much malevolent criticism, her action being subject to wilful and baseless misconstruction, an ungenerosity of treatment that was not checked even by her later sorrow and her irreparable loss. Fortunately, however, the odium of such treatment generally rebounds upon those who set it in motion, and there can be no doubt that Time, that great adjuster of wrongs, will place the Empress Frederick's character in its true light before posterity.

NEW PALACE AT POTSDAM.

Whether she would, bowed down by sorrow and tempered by grief, have had the combative powers left to recommence her work is perhaps doubtful, but in the early days of which we are treating she and her husband were full of youth, strength, hope,

[1] "Our Fritz" was the name the Prussians gave to the Emperor Frederick after the war of 1870.

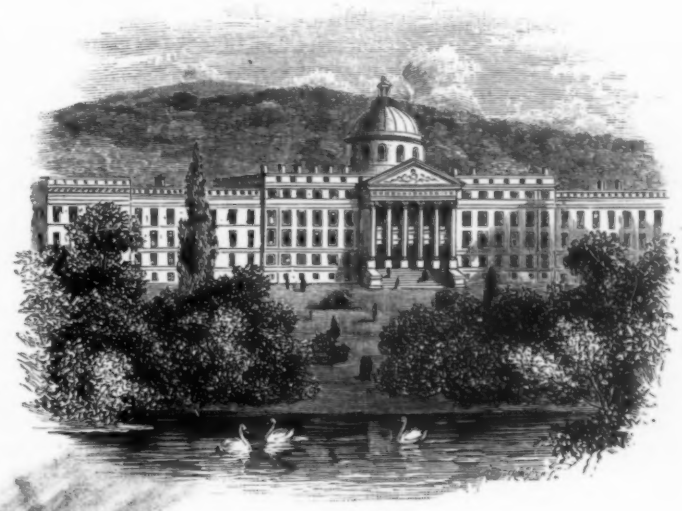
and enthusiasm, and they set to work with good will and happiness in the effort to educate their children for the State and for humanity. The nursery and all that pertained to it was the mother's province, and she looked after it—not like a princess, but like a good burgher's wife, introducing into her household many of the customs of her native land. The Princess Frederick William and her nursery soon became a favourite theme for picture and talk. A governess was assigned to Prince William, who watched over him till his sixth year, after which his education was entirely entrusted to Dr. Hinzpeter (son of the man who had filled the same office for the Emperor Frederick), who remained with him till his majority, and under whose direction the other tutors worked. Very special care was bestowed on the body as well as the mind of the royal children, in accordance with the mother's English ideas, that they might be also physically able to meet the demands made on them by their high station. To this day there exists in the park of Friederichskron a large space specially railed off as a playground, and here, in the early sixties, could be seen Princes William and Henry and Princess Charlotte[1] enjoying themselves, and being as dirty, as wild, and as merry as they pleased, in company with a group of children from the neighbourhood, selected from among all classes of the population. Gymnastics were especially favoured, and under the watchful eye of an old marine the boys clambered up tall scaffoldings and imaginary masts planted in the arid sand. The wastes of ground around the palace had also not escaped the notice of the active-minded Princess. She amused her leisure with landscape gardening, after the pattern of her father, and entirely metamorphosed this space. She also encouraged her children to follow this healthy pastime, giving them each their little domain, in which they might plant strawberries, currants, and gooseberries—and, what was better still, eat them to their hearts' content when they were ripe. The Emperor William may sometimes even now think of the little feasts he gave from his own garden produce, of the merry games played under the oaks and limes with his companions, now his subjects, when he and his brother Henry built fortresses of mud and sand and stormed them; in short, of all the quiet peace and true domestic happiness that was ever found at "Crown Princes'," as the Berliners familiarly designated the family.

A few amusing anecdotes of his early childhood have been preserved, one of which we give here. Like many small children, Prince William had a great dislike to being washed, and above all to the English daily cold bath. He often contrived to escape from the servants unwashed and to slip out into the garden, when he invariably sought out the nearest sentry box, for it flattered his baby pride, and pleased his already strong taste for soldiers, to see the sentinel present arms. One morning, however, when the Prince had scamped his bath and scrubbing and found himself upon the terrace in eager expectation of the happiness of seeing the tall grenadier face and present arms, what was his dismay when the sentry quietly continued his patrol, just as if no prince were present! This was a catastrophe that had never happened before. Bathed in tears of rage and disappointment, he rushed back into the palace and straight into his father's study. "Why what has happened, my boy?" tenderly asked the parent, when he saw the child's disturbed mien. Sobbing bitterly, the child told how the sentry had not presented arms as usual, although he had gone quite close up to him, so that he must have seen him, and yet the soldier did just as though he were not there. "Really," said the father, "that seems strange; just come a little nearer." Then looking at the boy all round, he quietly said, after a pause, "The sentry did his duty not to present arms to you." More astonished than ever, the Prince asked, "But why, papa?" "No soldier presents arms to an unwashed prince," said the father, quietly, and turned away to resume his work, taking no further notice of his son. Amazed, the boy stood rooted to the spot. But after a moment he roused himself and seemed to comprehend. In an instant he was back in his bedroom and begged as eagerly to be washed as before he had resisted the process. Of course the whole scene was a plot of the father's, who had counted on his little son's love for this pastime in order to cure him of his repugnance to his tub.

Among the items on the educational programme of the young princes was rowing upon one of the Potsdam lakes.

Into the early youth of Prince William there fell the three mighty wars which made Prussia strong and Germany a nation—the Danish, the Austrian, and the French. They inflamed the imagination of the boy with a love of military glory, of which he only saw the pomp and tinsel trumpet splendour, whereas his father had beheld its terrors and horrors too close to love them. That this father was the central hero of all this clashing, flashing, dazzling romance yet further excited the young prince, who was all alive to the military enthusiasm that surged around him, but blind to the anxious sorrow-worn looks of his mother, to his father's grave and solemn mien, when war was the theme of discourse. And especially did he get carried away by the military intoxication that took possession of all Germany in 1870–71. With ardour he studied the history of his native land and of his land's arch-enemy, the geography of France and Germany, the military situation, the state of the army and navy of both countries. He shed tears of rage at the thought that he was too young to take part in these days of his country's glory. When in March, 1871, grandfather and father returned to Berlin crowned with victory, the youngest soldier in the Prussian army, namely Prince William, then but twelve, could not be held back from going in person to the railway station that he might be the first to greet the heroes. And in the national festivities that followed, little Prince William was always to the fore; there was no keeping him quiet and attentive to his studies in those days.

[1] Now Princess of Saxe-Meiningen.



We can understand that this martial ardour gave food for anxious thought to the earnest parents, who looked at life through no rose-coloured spectacles, had no illusions, were not blinded by powder smoke. While still in the field, on January 27th, 1871, the then Crown Prince wrote in his diary: "To-day is my son William's thirteenth birthday. May he become a strong, loyal, faithful, and sincere man, a true German, and keep himself free from prejudices. It is enough to frighten one to think what hopes already fill the head of this boy, and how we are responsible for the direction which we may give to his education. This education encounters so many difficulties owing to family considerations and the circumstances of the Berlin Court."

After his return, this subject of their son's education was once more the theme of grave deliberation between father and mother. They finally decided, to the no small dismay of the grandfather, who was rooted to tradition and etiquette, that their boy should go to a common public school, and receive not only the same education as his future subjects, but should sit on the same school benches. It is easy to imagine the holy hands upraised in pious horror at this decision. Why such a thing was unheard of in the annals of royal houses ever since the foundation of the world. But "Crown Princes" were firm and not easily daunted when once they recognised a measure as right and wise; and though the Crown Prince proved all his life how well he knew how to practise self-repression, and to bear himself with dignity against all the enforced, accidental, and intentional difficulties that beset him in his delicate secondary position, where his children were concerned he evinced the energy that was native to him.

Prince William was therefore prepared for entering a gymnasium, and in 1873 passed, with some distinction, the preliminary examination at the Berlin gymnasium of Joachimsthal, being classed for the upper-third form. But, here again, "Crown Princes" did the unexpected, unconventional. They decided against letting their boy go to the Berlin institution. Nor was he even to go to the Potsdam gymnasium, proposed as a substitute. Their aim was to place him as far as possible from the Court and Court life, from the flippant, military, and Chauvinistic atmosphere of Berlin, so that the Prince should be surrounded only by an academic atmosphere, and should, if possible, become completely absorbed in his studies. To this end the gymnasium of Cassel was chosen, a town only lately incorporated into the Prussian dominion, in which, therefore, Prussian traditions did not yet obtain, where there could not as yet be an exaggerated reverence for the family of the conquerors. Moreover, the director of this institution was reputed a wise and careful tutor, and a man free from servility and time-serving.

When all was settled, however, Prince William did not at once take his place on the school benches. His parents wanted him to wait till his brother Henry was far enough advanced to accompany him. It was therefore not till the autumn of 1874 that the two young princes entered the Lycæum Fridericiarium of Cassel.

Before going, Prince William was confirmed. This is a solemn ceremony in the German branch of the Protestant church. The candidate brings a written profession of faith, drawn up by himself. These documents are carefully kept in the Prussian royal family, which always celebrates religious *fêtes* with a pomp which is imposing in its simplicity. In the course of his speech the young Prince said (emphasising his words, as is his custom to this day), "I know that difficult duties await me in life," and added that his courage would be stimulated by them, not cast down.

WILHELMSHÖHE.

Almost at once after this important ceremony the two princes left for Cassel. This little town, situate in the former duchy of Hesse, lies in a pleasant undulating district with some pretensions to natural beauties. It was at once decided that the two princes should live in winter in the former palace of the town, but in summer at the neighbouring castle of Wilhelmshöhe, which had so lately housed as State prisoner the ex-Emperor of the French. This was done to gratify Prince William's taste for natural surroundings and every form of outdoor and field sport. Their retinue was small and modest in all its appointments, and

study, real earnest study, was enforced by precept and example. And indeed both the lads proved themselves industrious and willing scholars.

Dr. Wiese, Prussian Inspector of Schools, who in 1875 visited Cassel, has left on record his impression of the royal pupil. He writes: "In appearance and deportment I found no difference between him and his schoolfellows, and his whole behaviour was modest and unassuming. The first lesson at which I was present in the Lower First was Thucydides. It had already surprised me to find this most difficult of all the Greek prose writers who are read in our schools in a class of which the scholars, as was the case with the Prince himself, had been but lately transferred from the Second; but my astonishment increased when I observed that the teacher, omitting the historical portions, had immediately fixed on one of the interwoven speeches, which are omitted even in the Upper First on account of their difficulty. Towards the end of the lesson I began to speak, and asked the Prince if he had already read other Greek historians. He named Xenophon. To my question whether he could indicate any difference between Thucydides and Xenophon, he answered, smiling, 'Oh, yes; I could understand Xenophon, but I can't Thucydides.' . . . He failed in none of my searching questions. . . . . The director praised his willing submission to all the rules of the school and his easy intercourse with his schoolfellows, although he could with great tact repel any undue familiarity. His honest diligence was also praised by his teacher; perhaps none of his schoolfellows were so severely accustomed to so exact and conscientious a division and use of their time. Faithfulness to duty—the virtue of the Hohenzollerns—was an ornament of his youth."

This severe learning alternated with corporeal exercises, walks, and exploring excursions. Especially on the Wednesday and Saturday half-holidays the Prince might be seen tramping the country, accompanied by a selection of his fellow-scholars. Winter was his favourite season. No weather daunted him, no matter how bad. If it was a half-holiday, Prince William might be encountered trudging over the heavy ground, covered up to his knees with the red-clay soil of Westphalia, and busy either with his surveying-rod, his botany-box, or his geological hammer. He would often come in wet to the skin, but only the more energetic and contented if he had conquered some physical difficulty. Thus while at Cassel he not only learned to swim, but to become expert in that art—no mean feat when it is borne in mind how he is handicapped by his lame arm. Skating, cricket, and croquet also found in him an ardent votary. In all things his life was submitted to rigid *régime*, and this was the case with Sunday, kept in accordance with German Protestant traditions of olden time as a day of abstinence from ordinary occupations. Attendance at divine service was obligatory, and was never missed. He was, however, allowed to ride or drive in State on that day, and to receive guests at his table—usually the dignitaries of the little town. Sunday evening was the Prince's favourite portion of that day. Then a number of his schoolfellows came to his house as guests, and it was usual to read German classics together. Sometimes charades were also permitted, or *tableaux vivants*. The holding of these little festivities was the only thing that distinguished the Princes from their comrades, but it was, of course, practically impossible for them to forget that they were princes of the reigning house, or for their schoolfellows to ignore it. For example, when from time to time the parents came to see their boys—unexpectedly, often, it is true, and always without ceremony—what a flutter they created! And with what almost fetish respect did the school receive the silken banner sent by the Crown Princess for the *fête* of Sedan, which Prince William in person carried triumphantly through all the streets of Cassel at the head of a *cortège* of his schoolfellows.

Although the parents were sincere in their wish to promote equality between the boys and their comrades, and the director was sincere and conscientious in treating them as pupils on the same footing as his other scholars, yet for all that, this education in common could only impress upon the Princes the fact, borne in on them by a hundred and one trifles, of the distance that separated them from their fellows. Prince William in particular, as the sentry incident proves, was early penetrated with the idea of his exalted station, and at Cassel it was remarked how, while seemingly charming with his comrades, he really held them far from him. Never for once did he appear to forget that he was a prince. And yet he no doubt honestly tried to make himself one of them, but the native haughtiness was rooted too deep and had lasted too many generations.

Before leaving the gymnasium he had, like all the other boys, to go through his *abiturienten* examination, that *dies iræ* of the German schoolboy which marks for him not only the close of childhood, but is the terrible day which irrevocably fixes his fate. For unless they qualify at this examination, all the learned professions are closed to them, and three years' military drill instead of one is their doom. No wonder this is an anxious fortnight for the boy who is leaving *(abiturient)*. Prince William went through his week of papers and week of *viva voce* together with his class-fellows and received the qualification of "sufficient," the lowest of the three standards required, which run sufficient, good, and excellent. Among the seventeen who were up for examination he was classed as the tenth. This was in January, 1877. It was a great pleasure to him that at the distribution of three medals left by a former rector of the school for donation to the three most industrious and worthy *abiturienten* of the year, one was accorded to him. Perhaps he owed this honour a little also to his station, but that he did not think so is proved by his words when thanking the director. "You cannot think what pleasure you give me in bestowing this medal on me. For it happens that I know I have deserved it. I have honestly tried to do all that lay in my power."

The prescribed formula of quitting the gymnasium requires each scholar to state what profession

he proposes to embrace. Prince William assigned as his, "Statecraft and Law."

The examination ended, he hastened to Berlin, since two days after his dismissal from school there awaited him an important function that should close an era of his life, for January 27th, 1877, was his eighteenth birthday, which constituted his majority. The event was celebrated as a festival throughout the length and breadth of Germany. By birthright the princes of the house of Hohenzollern are entitled to receive the Order of the Black Eagle, the highest German decoration. On this day Prince William received the solemn investiture.

Before this ceremony the Prince had received the English Order of the Garter as a birthday gift from his royal grandmamma of England.

Ordinary schoolboys would now have been permitted a little rest before resuming study, but not so this prince, whom his parents worked hard in order to harden him for the fatigues of his onerous station. It was now needful to initiate him into the special branches of training requisite for a ruler, and for a Prussian Prince this training, in the first place, deals with a military education. In point of fact, Prince William, after the custom of his house, was ranked as a member of the army from his tenth year, but actually he only entered it after attaining his majority.

A week after his birthday the Emperor William presented his grandson to his military superiors. The same morning the Crown Prince took him to Potsdam to introduce him to the 6th Company of the 1st Regiment of Foot Guards, to which Prince William belonged.

From the day of his formal entry into the army the Prince took up his abode in the Castle of Potsdam, serving precisely like any other lieutenant, for in military matters the Prussians know no favour. From babyhood he had been accustomed to rise early, so that each working day might be as long as possible. It was noted that he was ever the first at his post. His military service discharged, there was no rest for this youth. He then had to attend lectures by eminent officers of the War School, selected to instruct him in the science of war. Only Saturday evening was allowed as a holiday. Then Prince William would hasten to Berlin to spend Sunday with his parents, brothers, and sisters.

THE UNIVERSITY OF BONN.

On Monday morning, however, early dawn always found him punctually back at his post.

That the mental atmosphere of Prussian officers in which he now found himself was congenial to Prince William will readily be understood. Nevertheless, he did not let himself be subjugated entirely by their ideas. Their antipathy to the navy was especially distasteful to him. The German navy was just then beginning to work itself up to some position, and the army, unaccustomed hitherto to brook a rival, resented its pretensions. Prince William had a special liking for the new service, whose value and importance to the new-born kingdom he rightly recognised, and he went so far as to hold public lectures before his military comrades on the theme of a fleet, trying to prove to them its equality and its value. This fact helps to explain the great interest he showed in the English fleet on the occasion of the recent review at Spithead.

In the autumn of 1877 the Prince was sent to

the University of Bonn to complete his humanistic studies. Here he remained two years, following a very varied course of studies, drawn up by the Crown Prince and Minister Falk, and approved by the Emperor.

It is not known which study he preferred, but no doubt he extracted profit from all, after the manner of his mind, ready to draw to itself that mental nutriment which it found needful to it.

He also entered thoroughly into the life of the students, where he found much to attract him, for he loved, after the manner of German youths, those rather boisterous assemblies where singing, shouting, drinking, and laughing are the order of the day, or rather night. While at Bonn he gave a somewhat childish evidence of his hatred for all that pertains to his national arch-enemy France, anathematising champagne, a drink which indeed is never allowed to appear on his table, and encouraging his fellow-students to imbibe the sparkling products of their native Rhine. The Student Corps, with their customs of a past age, their uniforms, their military habits, attracted him. He was a member of one of the most celebrated corps in the German Universities, the *Borussia*. None surpassed him in performing the rites of beer drinking.

It was while at Bonn that Prince William knit yet more closely that really fraternal friendship which existed between him and the late Crown Prince Rudolph of Austria. The Emperor Frederick had also sought and found his youthful friendship in a Crown Prince, but he had selected the Prince of Savoy, now King Humbert, and his whole heart was wrapped up in that friend's fair land.

In 1879 the Prince's university studies ended. He was then twenty-one. It now behoved him to consecrate himself to his military duties, and to make his apprenticeship to politics. As before, he was worked very hard, but he threw himself with ardour into all martial affairs and administrative details. It was clear that he was burning to take his place in active life, and that he did not understand, like his father, how to hold himself in an attitude of unobtrusive self-repression. And yet the old Emperor William, though he was devoted to his eldest grandson, with whom he had far more in common than with his son, would allow no person to aid or support him even in the most trivial representative duties.

No less a person than Prince Bismarck initiated him into the mysteries of the Foreign Office, and from that instruction sprang the devoted worship which the Emperor William feels for his Chancellor. He also grew attached to his son, Count Herbert Bismarck, who is now his constant companion. Prince Bismarck returned the young man's regard with sincerity. He was anxiously desirous for his welfare, and, in those days above all, was preoccupied with the question of settling him wisely in life, for he recognised that, with the Prince's peculiar nature, the choice of a wife was a matter of no small moment for him. The Chancellor was also desirous that this time no foreign influence should penetrate into the Prussian Court. He had had enough, and more than even he could deal with, in the pronounced individuality of the English Princess. Conscious of her noble origin, devoted to her fatherland, and not to be cowed or subdued, she had at times given Prince Bismarck no little trouble. Prince William's wife should be a German, so the Chancellor resolved, and with this he inculcated his royal master, who was ever ready to listen to his faithful servant's ideas. She should also be of princely, but not of sovereign, origin, with no troublesome ideals or ideas of her own. Such girls, as Bismarck pictured in blunt, unchivalrous phrase, exist by the score, and it needed no Diogenes' lantern wherewith to seek them. A fitting personage was, however, found in the Princess Augusta Victoria, daughter of the Duke of Schleswig-Holstein-Sonderburg-Augustenburg, whose titles were larger than his estates, for of these he had been deprived all his life—a life spent in urging claims to which every government lent a deaf ear, as such petty States no longer fitted into the changed political conditions of Europe. It was in 1879 that Prince William accepted an invitation to shoot on the Silesian estate where the Duke lived in strict privacy, and here he first saw his future wife. Ere his death, which occurred soon after, Duke Frederick had the satisfaction of knowing that his daughter might one day be Empress of Germany.

On June 2nd, 1880, the engagement of Prince William was publicly announced with great pomp in Berlin. The union was viewed with satisfaction by the people, it having been well impressed on them by speeches and through the press that this new member of the imperial house was a German in every sense of the word—sprung from German stock, German in appearance, German in manners and customs. Since the reawakening of national self-consciousness in Germany with the events of 1870, no eulogy is sweeter to German ears than to designate a person or thing as "quite German." And the Princess is truly the typical German young woman, and this, no doubt, was her chief attraction to Prince William. For he, too, strives above all else to be German, though of course a German of the Prussian type. He will not permit the least foreign custom, whether English or French. That he should not love France is easy to understand, but his dislike of foreign nations extended also to England, whose dominion, he used to maintain, was too great at his father's hearth. The strength of this feeling is believed to have been modified by his visit to this country. But he was displeased at the authority his mother held in the house, and did not hesitate to express his displeasure with not always the most gentle or most chivalrous frankness, and he was determined in his person to return to the traditions of his family and marry a simple German lady, content to be nothing but a woman and a mother. It was not uncommon to hear the wits of Berlin making fun of the young Princess, who, they said, could only make sweets and jams. The Prince declared that he preferred in a woman the talent of making sweets to an aptitude for discussing a Constitution, and the majority of his countrymen, jealously tenacious of male preponderance and authority, fully agree with

him. That is why a superior upper servant is the ideal German woman of real life and romance.

On Sunday, February 27th, 1881, the marriage of the young couple was celebrated at Berlin with great pomp in the presence of royalties without number.

It is related, and it is to the Prince's credit, that he remained on duty at Potsdam up to the last moment. He came to Berlin with his company, which was under orders as a guard of honour, the day before the ceremony. On the very morning of his wedding day he returned to Potsdam to decorate the sergeant-major with his own hands.

In September of this year the Prince passed an excellent military examination, in the presence of his royal grandfather. That he succeeded so well was a matter not only of pleasure to his relations, but of surprise. It had been universally held by competent authorities that no young man had ever entered the Prussian army so little physically fitted to turn out a brilliant and smart cavalry officer. Indeed had he been an ordinary mortal, his physical weakness would have caused him to have been exempted from the need to serve. With his usual great self-command and energy the Prince had resolved that his lame arm should not stand in his way. He was proud when, conducting his regiment of hussars before the eyes of his grandfather, sharply critical in all military matters, he earned from him a meed of just and serious praise. And he was even prouder when his reticent redoubtable grand-uncle, the famous Red Prince, muttered, almost in a tone of apology, "Upon my word, you have done well; I never would have believed it." Justly proud too, for the praise thus obtained was the due meed for a rare self-control—a rare triumph of mind over matter.

The residence assigned to the young couple was the so-called Marble Palace of Potsdam, a pile not far distant from the home of the bridegroom's childhood. Here, on the 7th of May, 1882, was born the present heir to the German throne.

"Papa," cried the Prince to his father, the Crown Prince, who was impatiently pacing the gardens under the Princess William's windows. "Papa, papa, a boy!" The joy of the new-made father at the sex of the child was boundless, and he insisted on riding over to Berlin to deliver the news in person to his grandfather.

This first-born already wears the hussar uniform, and returns the soldiers' salutes like an old officer. He has four brothers—Eitel-Frederick, born in 1883; Adalbert, born in 1884; Augustus, born in 1887; and Oscar, born in September, 1888. The Emperor William II said one day, thinking, perchance, of future wars: "It is better to have plenty of boys, one may lose some."

The private life of the Prince, so long as he was Prince, was of the simplest kind, and this simplicity is continued to this day in private, though in public he has shown a love for pomp and show that is entirely out of keeping with the traditions of his ancestors, whose economy, approaching parsimoniousness, was proverbial. Although so short a time upon the throne, he has already asked for an addition to his civil list; an unheard-of circumstance in the Hohenzollern family. This is the plan of his daily life, given by an intimate. Very early rising is the order of the day. The Empress William always breakfasts alone with her husband, and even if he has to be on active service at early dawn she never fails to appear. Lunch is an unknown meal; as a foreign custom it is abhorred by the Emperor. He clings to the burgher midday dinner at one o'clock, and

THE MARBLE PALACE AT POTSDAM.

clings to it so strenuously that even Court dinners are now held at this most inconvenient hour. French cookery and French names upon the menu card are both equally forbidden. At five the family partake of tea, and after an early and frugal supper the couple retire to rest at about the hour their grandmamma of England rises from her dinner table. In the afternoon they often walk, drive, or row together, in company with their boys, to whom the Emperor is devoted. When the Emperor is from home, the Empress occupies herself with the various charitable societies she has founded or patronises, and in the evening assembles ladies around her to help her in sewing for her poor. Like her husband, she is fond of music, especially of the music of Wagner, whose patriotic and Teutonic tendencies are obviously in harmony with the Emperor's mode of thought. She has not, however, his artistic gifts. The

Emperor William has inherited some of his mother's talent, and paints very fairly. Marine subjects are his favourites, as indeed he is fond of all that bears upon the navy, sharing in this respect the enthusiasm of his brother Henry, to whom he is greatly devoted.

Indeed, this curiously composite nature possesses a great capacity for deep affection, as well as a great capacity for reverence. This latter quality came into play in his relations with his grandfather and with Prince Bismarck. True Prussian that he is, he is of course free from the slightest dash of romanticism or idealism, and sees only the concrete aspects of an idea.

Count Paul Vasili, not too kindly a critic, grasped him well, when he wrote: "He will be essentially a personal king, who will not let himself be led; he will have a healthy and straight judgment, prompt decision, energetic action, and firm will. When he ascends the throne he will continue the work of his grandfather, and certainly undo the work of his father, whatever that may be."

One of the marked characteristics of the Emperor is a great fluency of speech—a fatal fluency some might call it, seeing that some of his public addresses since he came to the front have not always been characterised by moderation of judgment or good taste, nor can he always mask his native impetuosity. There is a little tendency too towards hyperbole and bombast, but no doubt these are the faults of youth and inexperience, which time and circumstances will teach him to modify. The fact that he never prepares his speeches beforehand may have something to answer for in this respect.

The Emperor has given great attention to languages, and can speak Russian fluently. He is the first king of Prussia who has taken the trouble to learn that language. The very fact that the heir to the German Empire, amidst his pressing military and other duties, should of his own will, after his marriage, have added Russian to the English, French, and Italian which he had been taught as a lad, gives some hint of the strength of purpose of the man's character. Hitherto all the talk between the allied families of the Romanoffs and Hohenzollerns has been carried on in German.

The young Emperor William has thrice already visited Russia. After his first return home he determined to make himself master of the language of his neighbours, and a Russian teacher used to go daily to Potsdam. When Prince Bismarck heard of it he was delighted. "That is right," said he, "it will be good for Germany." At his second visit to St. Petersburg the Russians were indignant against Germany on account of the Bulgarian troubles. The Czar, however, invited the young Prussian Prince to be present at the manœuvres, and here he won the

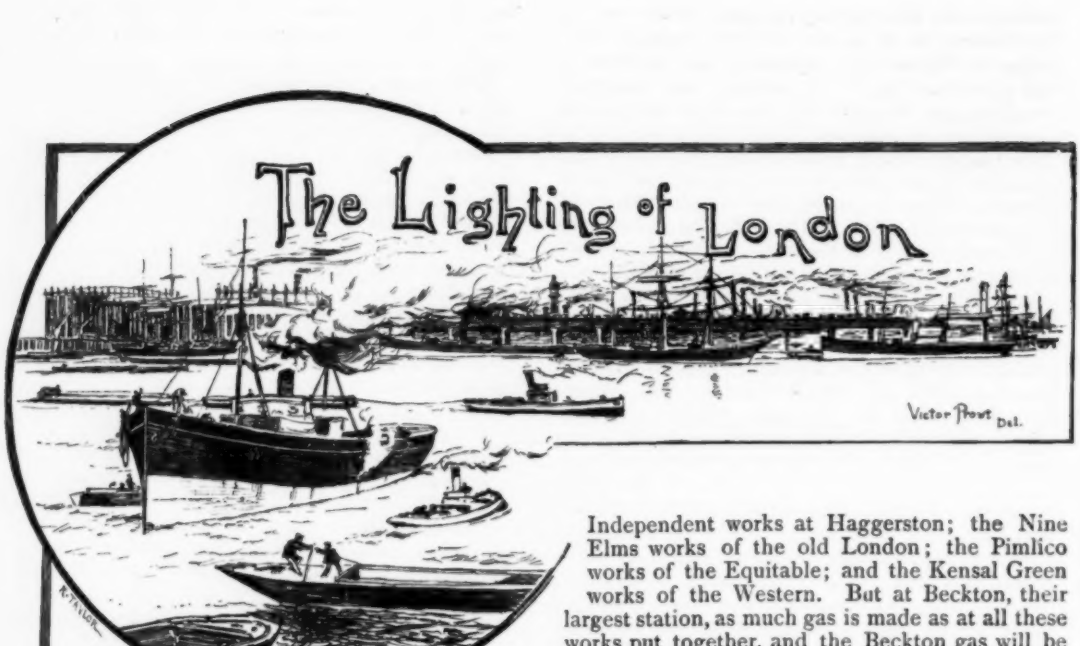
THE GERMAN EMPRESS.

hearts of the Russians by speaking to the officers and soldiers in their own beloved tongue. The Emperor William was charmed at the success of this mission. "In a few hours," said he, "my grandson has finished up an affair which had dragged on for months!"

The Emperor has lately manifested a new side of his character. There exists in Berlin a "Town Mission," which is engaged in both charitable and religious work. One of the principal personages associated with it is General Waldersee, Count Moltke's successor. He is married to an American, a daughter of General Lee, who is very zealous in the work undertaken by this little "Salvation Army." Madame Waldersee is connected with the family of the Empress through a former marriage with an Augustenburg. She enjoys the affection of the Empress, who is very religious, and the two families are on terms of intimacy. Indeed, the General, outside military circles, is chiefly notable on account of this American wife. Lord Dufferin once remarked that the importation of American ladies as the wives of European diplomatists was one of the most subtle means by which the New World was subjugating the Old, that there is hardly a capital of Europe that does not boast an American woman as one of its chief ornaments, and that some day the Old World will have to put a heavy protective tariff on this import of American heiresses. It is certain that the Emperor William, quite unsusceptible hitherto to the intellectual influence of any woman, has been much influenced by Countess Waldersee, and above all she has attracted him to give active support to the "Mission."



One evening, two winters ago, a meeting of notables from all parts of Germany was held at General Waldersee's, with a view to raising funds for the "Mission." The General opened the meeting. He explained the character of this enterprise, which was committed to no party, adding, however, that the "Mission" proposed to propagate the sentiment of fidelity to the king, and the spirit of patriotism. After which Prince William said: "The only way of protecting the throne and the altar against the tendencies of an anarchist and infidel party, is to reclaim the masses to Christianity and the church, and by that means to respect for authority and love of the monarchy."

This speech made a great impression. Pastor Stöcker, who has been a great promoter of this "Mission," thanked the Prince and Princess William for having "boldly worked for the kingdom of God." But this little incident did not please the party then supreme in Berlin, where "the kingdom of God," as proclaimed by Stöcker, is regarded with suspicion; and since Prince William ascended the throne, while his zeal for the "Mission" has not abated, his friendship with Stöcker has been less pronounced.

In June, 1888, died his noble father, a martyr to a remorseless disease, having followed his own aged sire all too quickly to the tomb.

It is too early to decide what nature of ruler William II will prove to Germany, but one thing seems certain, and that is, that it is his wish to be a personal ruler, and that he intends to give expression to his positive will and positive views. This was remarked in his first speech from the throne, where he substituted the pronoun *I* for the traditional *We*. During his brief reign he has certainly already displayed an energy and a passion for work which have almost a feverish character, and which have made those about him alarmed lest he should be overtaxing his strength; but Count Douglas, one of his favourites and confidants, has publicly assured the world that it need have no fears on this score, for that his methodical habits enable him to get through much labour.

The Emperor William is still a young man, and a very young ruler. It is premature to judge him. The future alone will show how he will develop, how his position will affect his character, and what bearing that character will have upon the welfare of his own land and of Europe. It is certain that he has, in a conspicuous degree, the Hohenzollern self-belief in a divinely appointed mission; and he is perhaps the only younger sovereign now sitting upon a civilised throne who sincerely believes that he sits there by the grace of God. What the result will be of such ideas held in the late nineteenth century, time alone will establish.

LONDON is lighted by gas, by petroleum, by candles, by electricity, and by a few odds and ends with which we need not at present concern ourselves. The chief work is done by gas, and the amount of that luminant consumed in the London area runs into large figures. The Metropolitan Gas Companies—officially so called—are three in number; they are the Gas Light and Coke Company, the South Metropolitan Company, and the much smaller Commercial Company; but these only do the larger proportion of the work. Around their districts, and branching into them, are many minor companies whose output must be included in any estimate of the consumption. Taking all the companies together, we shall find that London takes over 29,000,000,000 cubic feet of gas per year, led through its streets in over 3,800 miles of mains, and obtained from over 2,850,000 tons of coal. If this coal was stacked in one place it would form a rectangular heap about as long and broad and high as St. Paul's Cathedral, including the lightning conductor on the cross. Let us remember this. It may serve us in good stead when we are considering how fast our misguided country is using up its stores of energy.

The lion's share of this great work is done by the Gas Light and Coke Company, who light over 60 square miles and own over 1,800 miles of main. They are an amalgamation of many companies, and their works are scattered all over London. They have storage stations at Agar Town, Bethnal Green, Battersea, Vauxhall, and Horseferry Road. They have the works of the old Imperial Company at Bromley, Shoreditch, Fulham, and St. Pancras; the old Great Central works at Bow; the Independent works at Haggerston; the Nine Elms works of the old London; the Pimlico works of the Equitable; and the Kensal Green works of the Western. But at Beckton, their largest station, as much gas is made as at all these works put together, and the Beckton gas will be found lighting the London lamps fifteen miles away from where it was made. From Beckton to Horseferry Road run two mains. These mains are each four feet in diameter. This is alone sufficient to show what Beckton can do.

Beckton is approached across a waste, shaggy flat, the Gas Company's "reserve," cut up into squares by black roads and sluggish drains, in which, curiously enough, flourishes the Michaelmas daisy. There is room enough and to spare. The works are the largest in the world, and extend over an area as large as Clapham Common. They are named after Mr. Simon Beck, who was governor of the Chartered Gas Company at the time of their projection. Then their site was a swamp, and it was necessary to go down forty feet to find a foundation; now there are no firmer buildings or busier colony on Galleons Reach. Standing out four hundred feet into the Thames is a jetty twenty-eight feet above high-water mark, and giving sufficient frontage for 12,000 tons of coal to be unloaded in the twenty-four hours by the aid of the steam and hydraulic machinery with which the 'tween decks is loaded. And the coal, as it is lifted aloft by the cranes, three to each collier, is shot into railway trucks, and run at high level into the works.

There is little mystery in the manufacture of gas. The coal is cooked in retorts, and every ton, there or thereabouts, gives off 10,000 cubic feet of gas, 12 sacks of coke, 10 gallons of tar, 14 gallons of ammoniacal liquor, and 1 cwt. of breeze. The furnaces are lighted and worked up to a white heat. In three days, perhaps, they will be ready. The retorts, long, circular, or D-shaped ovens of firebrick made up of a centre and ends and closed in by iron doors, are arranged on the benches in each furnace-arch in fives, or sevens, or nines, and from above each door rises a pipe to the hydraulic main. The feeding of the

retorts with the proper mixture of ordinary coal and cannel is not an operation requiring a high grade of intelligence. A long scoop, like a cheese-taster, is laid on the stone floor and filled with "nubbly bits;" and the taster is thrust into the retort, turned over, and withdrawn. No wonder that human muscle is being replaced by gearing worked by compressed air. In this mechanical contrivance the coal is shot or elevated into a hopper; the hopper fills a feeding-trough that fits the retort; the retort-door is thrown open, the feeder is introduced, and its grooves opening, shed their contents into the fiery oven. Twice the feeder is thrust in from each end of the twenty-feet retort, and the coal is spread evenly all along. Then the doors are closed, and in four, five, or six hours, according to the temperature, the coal will have lost all that is worth taking from it. Then the door is opened, the coke drawn and run out, to be cooled at the bed and broken up, and come back to feed the furnace, so that the retort can be said to be heated by the coke it has previously made—not by all the coke, of course, for a good deal is sold to the public, and forms one of the profitable waste products. The Gas Light Company uses 1,880,000 tons of coal, and sells nearly 1,300,000 chaldrons of coke in a year.

At Beckton there are twelve retort-houses, the largest being 510 feet long and 100 feet wide, and having 45 beds each of nine retorts, making 405 in all. On each side are two lines of standard gauge railway, one over the other—the high-level for the incoming coal, the low-level for the outgoing coke. It is warm work in the retort-house; the half-naked stokers are as shiny as negroes and almost as black, for the perspiration clothes them with a skin-tight coat of moisture that lets no speck of dust pass by. And the labour is heavy—on the average a Beckton stoker deals with 4 tons 8 cwt. 22 lb. of coal per day.

The hydraulic main into which the ascending tubes from the retorts deliver is a huge pipe, half-full of slowly-running water, in which the gas is received and the tar and other products are condensed. It leads out to the pipe-condensers, and there the gas travels in a labyrinth until its temperature has been considerably reduced, and the naphthalin difficulty minimised. Along the labyrinth it is sucked by the exhauster, its pressure being regulated by governors at occasional intervals. And then it is cooled down and passes the exhauster, which is practically an air-pump. Up to it the gas is sucked, from it onwards the gas is driven to undergo its purification. It is washed by being sent through the bubbling water that forms the ammoniacal liquor, of which the three metropolitan gas companies make eighty million gallons a year. It is scrubbed from the ammoniacal gases by being driven up towers filled with wet coke or honeycombed with thin deal boards or by some other contrivance. It is purified from sulphuretted hydrogen by being driven through "grids" of slaked lime, and sometimes it is passed through oxide of iron. And finally it goes through a meter as big as a railway carriage, and enters the gasholder. At Beckton the largest holders contain two millions of cubic feet; at the new East Greenwich works of the South Metropolitan Company there is one holding eight million cubic feet, the largest in the world; at the Old Kent Road works of the same company there is one holding five and a half million cubic feet. This last is a familiar object to the South Londoner, and quite a famous holder in its way. It cost £47,000, and is in three lifts of 208, 211, and 214 feet respectively, each ring being about 53 feet deep.

With it we may as well end our rapid survey, in which we have advisedly steered clear of tests and bypaths. From the holder the mains run into the road, but as the gas passes the gate of the works it has to undergo a final examination. It must go out at a certain pressure, and a battery of gauges and appliances are here to qualify it accordingly. It must be of a certain lighting standard, and so it feeds a light that is not only perennial, like the sacred lamps of old, but, unlike them, is in constant comparison with a photometer, that it may be kept up to the mark. It must contain no sulphuretted hydrogen, and to ensure this there are hung in its path two little slips of white acetate of lead paper, which would instantly turn black with anger at the approach of so obnoxious an intruder. We need follow gas no further; suffice it to say that the London bill amounts to rather over £4,000,000 a year.

Next in importance to gas as a luminant stands petroleum, the consumption of which has increased so enormously of late years. Close upon a hundred million gallons are now yearly imported into the United Kingdom, and to this should be added the unfortunately decreasing output of the Scotch companies. The wells of America and the springs of Baku have almost swamped the home industry, but they have made petroleum so cheap that it is becoming a dangerous rival to gas, not only as regards cheapness, but as regards power of light. Only a year ago Gravesend, having to choose between gas and oil for street-lighting, deliberately chose oil as being cheaper and giving a better light for the money. Even in the London area there are streets lighted by petroleum. And the recent improvements in the treatment of petroleum, in its gaseous as well as in its liquid state, show that we have not yet reached the limit of its excellence, and that for hydro-carbon there is, indeed, a good time coming. But on petroleum, as on the by-products of gas manufacture, we might fill pages, and that is not our immediate purpose here. Petroleum is used for so many purposes now, that the amount consumed for lighting alone is not easily arrived at. Often 4,000,000 gallons at a time are stored at one spot in the metropolis, but what the metropolitan consumption is can only be guessed at. We shall be well within the mark in estimating it at 10,000,000 gallons.

As regards candles, we are in the same difficulty. No statistics exist which would enable us to apportion the London share. Over 36,000

tons of candles are made in the kingdom in a year, and an increasing number of candles are imported to be set against the amount of British exports, chiefly to the colonies. It has been estimated that the gas consumption is represented by a burner per head, and that the candle consumption has now dropped till it averages but a pound to every gallon of mineral oil. If this be correct, London would take over 4,000 tons, which seems to be rather too liberal an allowance. However, we may include in the amount the colza and other vegetable oils, and so put ourselves on the right side.

The minor luminants we can afford to disregard. Practically, oil is the light of the poor, and gas the light of the well-to-do; but that gas will eventually have to give electricity a large share in its lighting dominion is inevitable.

The electric light has passed through all the stages needful for success in these days. It has run the gauntlet of over-advertising, patent-evading, and shareholder-plucking, and, apparently subsiding overwhelmed, has risen with new vigour and begun its business career on a foundation of ruined reputations in that quiet, steadily-growing way distinctive of a solid industry. With the late Board of Trade inquiry it entered on a new stage. The report of Major Marindin marks an epoch in the lighting of London.

The inquiry was held, it will be remembered, under the Electric Lighting Acts of 1882 and 1888 with reference to the applications of some thirteen companies for provisional orders and licences to supply electricity—or "energy," as it is thought best to call it—in different districts of the metropolis. The report is worth reading. In its "Recommendations" it allotted to the London Electric Supply Association all that part of St. Martin's-in-the-Fields lying south of the Strand and west of St. Martin's Lane, all Westminster north of Victoria Street, except the small portion west of St. George's Hanover Square; all St. James's, and all St. George's Hanover Square, and Chelsea; and on the south of the Thames, Greenwich, Rotherhithe, Bermondsey, Southwark, and that part of Lambeth north of Westminster Bridge Road. To the Metropolitan Electric Supply Company were allotted St. Giles's, St. George's Bloomsbury, Holborn, St. Sepulchre's, Hatton Garden, Soho, Covent Garden, the Savoy, St. Mary-le-Strand, St. Marylebone, St. Mary Lambeth, Clapham, and Streatham; and to the same company was allotted that part of St. Martin's-in-the-Fields east of Northumberland Avenue, Charing Cross, and St. Martin's Lane. By this arrangement the only area in which there will be two competing alternating current companies is in North Lambeth, where such a state of affairs could not well be avoided owing to the outlying southerly territory claimed by the Metropolitan. Kensington and Knightsbridge were shared among the House-to-House Electric Light Supply Company, the Kensington and Knightsbridge Electric Lighting Company, the Notting Hill Electric Lighting Company, and the Chelsea Electricity Supply Company. To the Westminster Electric Supply Corporation was given a share in Westminster. For Paddington and St. Pancras there was no grant recommended, as those parishes had expressed their intention of carrying out their electric lighting for themselves. Since the report the City authorities have divided up their important territory, and given the western third to the Metropolitan Company, the centre to the Anglo-Brush Company, and the east to the London Electric Supply, under which three contracts 395 arc lamps are to take the place in the thoroughfares of 1,730 gas-lamps, and give more than double the light at less than double the cost. And there have been other advances; among them Clerkenwell and Newington have been assigned to the London. Many of these allotments have been begun upon, and there are very few that will not be taken up. In the coming year there are 115 applications for lighting in the metropolitan area. Of these the London is responsible for 41, the Metropolitan for 6, and the House-to-House for 20, mostly for the outlying districts. One sign of the times is noteworthy. Among the 479 applications for the whole country, three are from gas companies, who propose to combine the old and new lights, and supply their customers with either.

By far the largest of the companies is the London Electric Supply Corporation, to which the main share in lighting the metropolis has been assigned. Their central station at Deptford is not only the largest in the country, but it is—and for some time will probably continue to be—the largest in the world. On the Continent every capital has its light-station, and there is hardly a town in the United States which has not its installation; but nothing on so large a scale as the Deptford works has as yet been thought of out of Britain.

Five years ago Sir Coutts Lindsay made up his mind to light the Grosvenor Gallery by electricity. "Put down twice the machinery, produce twice the current you require, and let me have what you can spare." So said a neighbour. Other neighbours joined in, and the installation began to grow. The Earl of Crawford and Lord Wantage joined Sir Coutts, and the private company familiarly known as the Grosvenor Gallery Company was formed. Still the demand grew, and "Sir Coutts Lindsay and Co., Limited," developed into the London Electric Supply Corporation, working from the Grosvenor no less than 33,000 lamps, and lighting an area extending from Regent's Park to the Thames, and from Knightsbridge to the Corporation Griffin. Now the Grosvenor is to become a mere subsidiary station, and the main work is to be done at Deptford, and extend over a radius of thirteen miles.

The two systems, the old and the new, are thus brought into keen contrast on London's great highway. Approaching the City by the river, Beckton, with its two hundred acres, lies to the right; Deptford, with its four acres, to the left. Beckton takes its 30,000 tons of coal a week; Deptford, in full swing, will take but 3,000; and while Beckton is supplying its half million of lights, Deptford will supply just double as many.

The Deptford engine-house, as it at present stands, is a wonder. It is a hundred feet high from the floor to the roof, 195 feet long, and two cricket pitches across. The boiler-house on the other side of the wall is 70 feet broad, and contains boilers now giving steam for engines of 13,000 horse-power; these are the first instalment of a series which will soon be ready to give 65,000 horse-power, and then be duplicated. These boilers are on two floors, the upper floor being supported on pillars 30 feet high; and above this upper floor is another floor similarly supported on 30-feet pillars, which will contain the store of coal which will be supplied to the furnaces by means of vertical shoots running through the centres of the floors of the upper boilers to the lower ones. From this lofty coal-yard, a high-level railway will run out on to the wharf, so that the steam colliers will be unloaded direct into the trucks, and the trucks run at once to shoot their contents on to the top storey.

Each battery of six boilers is placed in connection with four sets of "economisers;" the steam from the boilers is gathered in steam-drums above the ordinary water-drums, and the steam-pipes leading to the engines are in duplicate. At each end of the boiler-room is a chimney-shaft—not a tall, slender cylinder, but a massive square tower 130 feet high, pierced by four flues. Besides the high-level line, there is a low-level railroad, starting from the river and running through the middle of the buildings, and at right-angles to this, 50 feet and more overhead, run two travelling cranes, one lifting 50 tons, the other 25 tons.

The engine-room is divided into halves by a row of tall columns supporting the roof and these cranes. In the half near the river are two dynamos, each driven by a 1,500 horse-power engine. In the half away from the river are to be two large dynamos, each driven by a 10,000 horse-power engine. What the large dynamos will look like when set up can be seen from a dividing-engine on the floor, on which the semi-circumference of one of the armatures is being spaced out. The circle is 46 feet across—the biggest thing ever projected in electric engineering, and a sort of Laxey wheel among dynamos. The engines and dynamos are combined in such a manner that this 46-feet armature will be driven direct, and act as a flywheel. The crank-shafts, of which three were cast at Beardmore's, are the largest castings ever made in Scotland. They are over 36 feet long and a yard in diameter, and each in the rough weighs 75 tons. When these great engines are going at full power they will each supply current for 200,000 lights. And all further engines are to be of this size. Up to a certain limit, there is no doubt that the larger the generator the more economically it can be worked. Whether the limit has been exceeded in these giant machines remains to be discovered.

Even the small dynamos in the north-western corner, driven by the 1,500 horse-power engines, are the largest electrical generators yet built. They each supply 25,000 lights; the Grosvenor Gallery dynamos, which have hitherto held pride of place as yielding the highest electrical efficiency, supplying only 15,000 lights. The armatures are 14 feet 6 inches in diameter, and are mounted direct over one end of the driving-pulleys, which are 7 feet 6 inches in diameter and 8 feet wide. The machines are of the Ferranti type—Mr. Ferranti is the company's engineer and the designer of these Deptford works—and the copper-ribboned armatures are as usual thin, so that the magnet-poles are very close and the field of force intense. One safety appliance is remarkable—the brushes are in a box magnetically locked, so that as long as the current is passing they cannot be got at. Between these dynamos and the wall are three "exciters" of the Kapp pattern, and on the other side of the central railway is a space reserved for condensing-engines, but temporarily occupied by steam tools, among them the largest planing-machine yet made, taking 20 feet horizontal and 20 feet vertical. When the engine-room is complete it will contain a special winding-engine and barring-engine, by the aid of which the 46-feet dynamos will be taken to pieces in a minute and a half. In the small engines now erected, the facilities for slipping them apart are distinguishing features; the heavier pieces rest on sliding-beds, and are held in position by a few powerful screws, which can be loosened in an instant, and drop down into grooves, so as to clear the slide at once.

The hall has been designed and the machinery placed so that from an elevated gallery the engineer will have the whole in view at all times—and a wonderful sight it will be. No wonder that "the making of the lightning" on such a scale has caused the timid to fear that the "attraction" may be rather in excess at Deptford, and that the "influence" may be over-strong. Such an amount of power will never before have been gathered on so small an area—never, that is, since Laurie's Norbert went flying moonwards with the Peak of Tehbali.

And all from the spinning of a wheel! Fifty-eight years ago Faraday discovered electro-magnetic induction; that currents could be induced in a closed circuit either by moving magnets near it, or by moving the circuit across the field, or by a current with changing strength. His discovery suggested the magneto-electric machine, Pixii's being the first, in 1833. Two-and-twenty years ago Siemens and Wheatstone independently found that a coil rotating between the poles of an electro-magnet would, from the feeble residual magnetism, induce a small current, which, when transmitted through the coils of the electro-magnet, might exalt its magnetism, and so prepare it to induce still stronger currents; and from this discovery came the dynamo of which in the colossal Ferrantis we have the latest and largest development.

And now, having got this tremendous current, how is it distributed? The trunk main is made at Deptford. It is in 20-feet lengths and is $2\frac{7}{8}$ of an inch in diameter. First, a copper tube is taken, and in a lathe-like apparatus which is fitted with a long trough, it is covered with the insulating material and taped in spirals; then the insulated tube is thrust into a larger copper tube

and the long bar is drawn as if it were wire, so that the copper case and the insulating material are pressed hard and compact on to the conducting tube; then the outer tube is coated with another eighth of an inch of insulator, and this in its turn is pressed into a steel pipe to protect the whole from injury. This is quite a new form of cable, the object of the change being to cut off all risk of danger. If anything were to go wrong with the conductor, the insulating material would simply be burnt through, and by means of the casing connection would immediately and harmlessly be made with the ground. These solid 20-feet lengths are joined by a conical joint and form a continuous bar, and this bar, "the trunk main," comes to London along the railways. By arrangement with the South-Eastern, the Chatham and Dover, the Brighton and South Coast, and the District Companies, the main is brought to the terminal railway stations, and run along the Inner Circle line to different points in the London area. This co-operation of the railways is the great feature of the London supply scheme. The current leaves Deptford at the unprecedentedly high pressure of 10,000 volts; at transforming stations, such as Ludgate and Charing Cross, it is "expanded" to 2,500 volts, and taken in distributing mains to the consumers' premises; there it is again "expanded," and at a pressure of 100 volts or 50 volts it enters the house and lights the lamps. The "transformers" are on the principle of induction coils; the primary coil, consisting of many folds of thin copper, receives the incoming small currents of high potential; the secondary, consisting of fewer folds of thicker copper, delivers the enlarged currents at a lower potential, the "watts" of the secondary being equal in number to the "watts" of the primary, while the "volts" of the secondary are to the volts of the primary as are the number of the folds in the two coils.

"Volts and watts indeed!" says the wondering reader, "and what are they? Give me a definition!" A reasonable request, surely; for was there not a time when even cubic feet and atmospheres had to be defined in the terms of some other mode of measurement? And volts and ohms and ampères and watts will soon be as familiar to the London housewife as pecks and pounds and feet and gallons. The volt is the practical unit for the measurement of electro-motive force, and without going into detail may be taken as representing a little less than the amount of that force given by one Daniell's cell. The ohm is the practical unit of resistance. The ampère is the unit of current obtained by the potential of one volt through one ohm. The watt is the unit of electric power; it is the amount given by one ampère working through one volt; and it may be as well to note that there are 746 watts in one horse-power.

But enough of the London scheme. The system adopted by the Metropolitan and House-to-House Companies is the supply from a number of generating stations, in or near to the area lighted, by distributing mains carrying the current at a pressure of from 2,000 to 1,000 volts to the consumers' premises, or to distributing stations, where, as in the London system, it will be transformed to a pressure of 100 or 50 volts. Thus, the three chief companies are agreed in supplying high-pressure alternating currents and transformers.

But at present it has not been found practicable to utilise alternating currents for the purposes of driving power—to work a motor a continuous current is required. Such a current is given by the Chelsea Company, who have one generating station for a considerable area, and charge with a pressure of from 1,000 to 2,000 volts several accumulator stations, there being duplicate sets of batteries at different points within the lighting area. From these stations the current is carried direct into the consumers' premises at a pressure of 100 volts, the supply being quite free from accumulators. A continuous current is also supplied by the Kensington and Knightsbridge Company, who work partly by accumulators and partly by dynamos, the former doing the whole task during the hours of minimum supply, and the latter being employed in charging the batteries and supplementing the direct supply from them during the hours of maximum requirement. It is this system which the Notting Hill Company and Westminster Company propose to adopt. The system of the St. James's and Pall Mall Company, whose D-shaped trays and copper band conductors have recently made themselves so conspicuous in traffic obstruction at the West-end, is the simple direct one at low pressure, without any accumulators, and available only over small radii so as to necessitate a large number of generators.

Which of these systems is to triumph in the long run time will show. At present the policy of the Board of Trade is to allow not more than two companies in the same area, one of these to supply alternating currents, the other continuous; to make them lay their mains in the same subways or conduits; and leave the fittest in the struggle to survive.

## POPULAR BALLAD POETRY OF IRELAND.

BEHIND Ireland fierce and militant, is Ireland poetic, passionate, remembering, idyllic, fanciful, and always patriotic. With this second Ireland only have I to do in this article, and what it writes and reads. I have here a row of little blue-paper-poem books—a whole ballad literature as foreign from all modern English ways as though it were of farthest Iceland and not of neighbouring Ireland, and unknown in name even to most Anglo-Saxon households.

Every now and then the world may read in the accredited organs of enlightenment that the ballad or dramatic poem, or something else, is obsolete. The writers of these little blue books wrote on regardless; but then, perhaps, the accredited organs of enlightenment never reached them or their barbarous mountains, or their readers, who read and sang, and delighted in what they wrote, as men delighted in poetry of old before organs of enlightenment were even heard of. It is centuries since England has written ballads. Many beautiful poems in ballad verse have been written; but the true ballad—the poem of the populace—she has let die; commercialism and other matters have driven it away: she has no longer the conditions.

For a popular ballad literature to arise, firstly are needful national traditions not hidden in libraries, but living in the minds of the populace. These Ireland has. Every ivy-matted tower carries its legend of stormy feud or love-lorn lady; every little round rath earth-piled its story of leprehaun and pooka; and over all broods the one great dominant thought, love of country, while around that thought gather the long-remembered names of exiles.

Secondly, it is needful that the populace and the poets shall have one heart—that there shall be no literary class with its own way of seeing things and its own conventions. This condition Ireland has long had—whatever the people were the poets have been more intensely; were the people poor, they were poorer; did the people suffer, they suffered also. Did the people love their country, did not the poets keep alive that love through years of misfortune? They were one with the people in their faults and their virtues—in their aims and their passions.

Hence, long before the days of these little blue-paper-poem books, in the mere Gaelic-speaking days, was a copious ballad literature going from mouth to mouth, for few could read. Since the time of Elizabeth (when English ballad literature began to die) have arisen in Ireland twenty-six Gaelic-speaking poets of fame, no less; and many a fameless one-song man, like the author of that old seventeenth-century song so popular in Galway and Mayo, with its pathetic ending, as it goes in a translation now old itself:

"'Tis my grief that Patrick Loughlin is not Earl of Irrul still,
And that Brian Duff no longer rules as lord upon the hill;
And that Colonel Hugh McGrady should be lying dead and low,
And I sailing, sailing swiftly from the county of Mayo."

In the last century there gathered in Munster a most notable group of Gaelic poets, some of them strolling ne'er-do-weels of genius, like that O'Tuomy, who wrote over the door of his inn, when he had a door to write over, much to the indignation of his wife—

"Should one of the stock of the noble Gael—
A brother bard who is fond of good cheer—
Be short of the price of a tankard of ale,
He's welcome to O'Tuomy a thousand times here."

Others were hedge schoolmasters, who, when to educate was penal, taught for a living in the hedges and ditches, and while the thing was forbidden seem to have aroused among the ploughboys of whole country-sides quite a furore for Latin, ay, and even Greek. Men like that Macnamarah, who, banished by poverty brought on by his own love of frolic and imprudent satire,

wandered away into foreign lands far from mirth and boon companions, and composed the "Fair Hills of Earie 'O;" or like him who, exiled at Homburg, wrote the more famous "Hills of Holy Ireland." Thus beautifully has Fergusson translated this exile song of a nation of farmers:

"A plenteous place is Ireland for hospitable cheer,
Uileacan dubh O!
Where the wholesome fruit is bursting from the yellow barley ear,
Uileacan dubh O!
There is honey in the trees where her misty vales expand,
And her forest paths in summer are by falling waters fanned;
There is dew at high noontide there, and springs i' the yellow sand,
On the fair hills of Holy Ireland.

Curled he is, and ringleted, and plaided to the knee,
Uileacan dubh O!
Each captain who comes sailing across the Irish Sea,
Uileacan dubh O!
And I will make my journey, if life and health but stand,
Unto that pleasant country, that fresh and fragrant strand,
And leave your boasted braveries, your wealth and high command,
For the fair hills of Holy Ireland.

Large and profitable are the stacks upon the ground,
Uileacan dubh O!
The butter and the cream do wondrously abound,
Uileacan dubh O!
The cresses on the water and the sorrels are at hand,
And the cuckoo's calling daily his note of music bland,
And the bold thrush sings bravely his song i' the forests grand,
On the fair hills of Holy Ireland."

Beautiful as some of their poems were, the hedge schoolmaster's work was often pedantic in manner and tepid in matter, far inferior to the mere peasant poetry. The hedge schoolmaster, indeed, with his zeal for learning, and his efforts, not often successful, to do creative work, was a not uninteresting forerunner of the modern man of letters.

The poets of those days would make a long list—Andrew Macgrath, surnamed "The Merry Pedlar;" O'Sullivan the Red, pious and profligate; John MacDonnell, of vision-seeing memory; John O'Cullen, who lamented in such famous words over the Abbey of Timoleaque; and Hefferman, the blind, who in his old age loved to stand listening while the ploughboys in the hedge school droned out some Greek poet; and many another.

Twice a year, in the earlier portion of last century, they held what were called sessions of the bards. Young poets used to recite their verse against each other, the victors being crowned. These meetings were finally suppressed by the penal laws.

The political poetry of these men was no light matter in its day. Because of it they were hated and pursued by the powerful and the rich, and loved by the poor. They disguised their meaning in metaphor and symbol. The poet goes out in the morning and meets a beautiful spirit weeping and lamenting, a "banshee" with "a mien of unearthly mildness." On her he lavishes all his power of description, and then calls her Ireland. Or else he evades the law by hiding his sedition under the guise of a love-song. Then Ireland becomes his Kathleen, Ny-Houlahan, or else his Roisin Dubh, or some other name of Gaelic endearment. To her he sings:

"Oh! the Erne shall run red
With redundance of blood,
The earth shall rock beneath our tread,
And flames wrap hill and wood,
And gun-peal and slogan cry
Wake many a glen serene,
Ere you shall fade, ere you shall die,
My dark Rosaleen!
My own Rosaleen!
The judgment hour must first be nigh,
Ere you can fade, ere you can die,
My dark Rosaleen!"

As it goes in Mangan's version.

So things went on, until some two or three decades before the printing of these little blue books men began to look for a national poetry printed in English. A new literature commenced. The stock of originals at first was scanty; the new movement depended for a time mainly on translations. At the beginning of this new movement were Walsh and Callanan.

Callanan crowded much capricious incident into his short life, beginning in 1795 and ending at Lisbon—whither he had gone as a tutor, in hopes of recovering his health—in 1829. After training for the priesthood he enlisted as a soldier, and was bought out by his friends as his regiment was on the point of sailing for Malta. Subsequently he wandered through the country collecting old legends to dress up in verse or prose for magazine or newspaper, and translating old Gaelic peasant songs.

It is interesting to know that shortly before his death the old passion came uppermost, and he began collecting songs and legends among the Spanish peasantry.

His friends found him, I fear, a great ne'er-do-weel, and yet he asked not much—no man's wealth—only food to eat and a little leisure to hunt out and meditate on the stories he loved. Maybe in some distant time the poets will no longer gather together in cities, but stay, as he did, in their own country-sides, content to write of the people about them, and so shall poetry sweeten the lives of even the simplest of folk, for assuredly the legends of the hills that we see in childhood and age from our own doors, so far as we are simple and natural, are more to us than the legends of any other place on earth. Such a poetry would go deeper into men's lives than any verses of the cities, no matter how full these be of the passion of intellectual attainment.

Callanan, like his successor, Edward Walsh, has left a few original poems—passionate, sincere, and simple verses, celebrating the scenes and legends of his native Munster.

Edward Walsh, born in Londonderry in 1805, a militiaman's son, had all along a hard time of it—

first overworked schoolmaster of Cork, afterwards overworked schoolmaster of Spike Island. Nevertheless, he did manage to bring out two small collections of translated popular songs, Gaelic and English side by side. "We remember," writes his latest editor (though now forty years since), "following Walsh in the twilight of an autumn evening, drinking in the odd chords that came from the little harp that lay on his left arm as he wandered, lonely and unknown, by the then desert Jones's Road, or reposed himself on one of the seats that at the time were outside the walls of Clonliffe House." Passionate, wild songs were they, well-nigh Oriental in their ardour, that he loved to sing to the little harp on his left arm.

A simple and spontaneous thing was this peasant poet-craft. The man who wrote love-songs really was in love. The man who wrote laments really was unhappy. Poor dead Gaelic men, how many centuries ago did they sing the funeral song above you, and here are your passions and sorrows crying from Edward Walsh's little harp!

The troubled year of '48 found him still schoolmaster to the convicts at Spike Island. When John Mitchell was sent there on the way to his Bermuda hulk, Walsh approached him reverently, and, stooping, kissed the famous rebel journalist's hand, and said, "You are now the man in all Ireland most to be envied." That night John Mitchell meditated over it all in his journal, thus: "Poor Walsh, he has a family of young children; he seems broken in health and spirits. Ruin has him in the wind at last; there are more contented galley-slaves toiling at Spike than the schoolmaster. Perhaps this man does really envy me, and most assuredly I do not envy him."

His death was not so far off now, for the schoolmaster, having got little good of his five-and-forty years, died in 1850; but lived long enough to see in his last decade the rise of a literary movement that gathered his and his fellow-workers' poems from old newspapers and magazines or readerless volumes, and printed them in thousands with new and worthy companions.

This movement began with the founding in 1842 of the "Nation," a powerful and seditious sheet in those days. Everything was considered Irish that embodied Irish passion and thought. In the ballad collections that began in 1845 with Gavan Duffy's "Ballad Poetry of Ireland"—a volume with a larger circulation than any other published in Ireland—and the first of these little blue books—a few Orange ballads even found place.

An Irish poet was to write on his title-page later on:

> "We are one at heart if you be Ireland's friend,
> Though leagues asunder our opinions tend;
> There are but two great parties in the end."

In Duffy's ballad book what was to grow plainer as years went on was already plain—that three men, Davis, Fergusson, and Mangan, stood above all other Irish writers of that day.

Not one of those I have heretofore discussed could have been called a prosperous or happy man, and Clarence Mangan, the greatest, it will be seen, was also the most miserable. The others were poets of the farm and the hills. The lover in the old ballad laments because he has no riches for his beloved, no cattle "to drive through the long twilight." In the earliest poems of seven hundred years ago, as in the latest, the singer's sweetheart has lips the colour of the berries of the quicken-tree (the mountain ash). In his more sentimental moods he sings like the lover in the Munster peasant song, whereof I make this version:

> "My love, we will go, we will go, I and you,
> And away in the woods we will scatter the dew,
> And the salmon behold and the ousel too.
> My love, I and you, we will hear, we will hear,
> The calling afar of the doe and the deer,
> And the bird in the branches will cry for us clear,
> And the cuckoo unseen in his festival mood.
> And death, O my fair one! will never come near
> In the bosom afar of the fragrant wood."

Than which same pastoral aspiration I know nothing more impossibly romantic and Celtic. Nature with these men was a passion, but in the poetry of Mangan are no beautiful descriptions. Outer things were only to him mere symbols to express his own inmost and desperate heart. Nurtured and schooled in grimy back streets of Dublin, woods and rivers were not for him. His father boasted that his children would run into a mouse-hole to escape him; afterwards shut up in a scrivener's office, the amenity and beauty of human intercourse was not for him. Sensitive in an extreme degree, persecuted and solitary, in this scrivener's office he spent seven years; three more years he laboured as an attorney's clerk to support father, brother, and sisters, then wholly depending on him; for the father, when Mangan was quite a young lad, finding him of working age, appears to have struck work. Hard drudging it was year in year out. No wonder he wrote—

> "All my divinities have died of grief,
> And left me wedded to the rude and real."

And yet he found time to read many an out-of-the-way book and to teach himself German, Spanish, Italian, French, Latin, and maybe some smattering of Oriental tongues, though this is not certain, and to write several strange and pessimistic poems.

But already from his ever-growing misery he seems to have sought solace in opium and gin. In Mount Pleasant Square, Dublin, lived three sisters, of higher social position than he. With Frances, the youngest of these, he fell in love madly, hopelessly. She encouraged him; and then, when the novelty wore off, sent him about his business. Whatever of brittle happiness had staid with him was quite gone now. More and more did he seek to blot out memory with gin and opium.

His father was dead, but his ghost, as he believed, with other phantoms, haunted him day and night. In his latter days some one found him a

post in the Library of Trinity College, more congenial than scrivening.

"An acquaintance pointed out to me," wrote Mitchell, "a man perched on the top of a ladder, with the whispered information that the figure was Clarence Mangan. It was an unearthly and ghostly figure, in a brown garment (the same garment to all appearance which lasted to the day of his death). The blanched hair was totally unkempt; the corpse-like features still as marble; a large book was in his arms, and all his soul was in the book. I had never heard of Clarence Mangan before, and knew not for what he was celebrated, whether as a magician, a poet, or a murderer, yet took a volume and spread it on the table, not to read, but with pretence of reading, to gaze at the spectral creature upon the ladder."

Many of his earlier poems had been printed in the "Nation;" but now he transferred his allegiance to Mitchell's "United Irishman," contributing thereto much verse, original or translated, from Gaelic song or German ballad. But gradually he became useless for any good purpose. For days together he would disappear. A priest, I have heard said, brought him once before a looking-glass, and pointed to his haggard face and tattered clothes therein reflected. "Ah!" cried Mangan, "it is nothing to the state of the inner man."

In the end he fell a victim to cholera (he always believed he would die of cholera), at the Meath Hospital, in 1849, he being in his forty-seventh year. After death his face was sketched by the present head of the National Gallery of London, and the sketch hangs now in the Irish National Gallery. In the beautiful profile there is visible no mark of his life's struggle. The poor crazed soul, as it seemed, had left the clay to the ancient innocence of dead things. Few more pitiful stories are on record. But who will say anything about his life, momentous as he himself has said, under the symbol of Siberia:

"In Siberia's wastes
The ice-wind's breath
Woundeth like the toothèd steel;
Lost Siberia doth reveal
Only blight and death.

Blight and death alone—
No summer shines.
Night is interblent with day.
In Siberia's wastes alway
The blood blackens, the heart pines.

In Siberia's wastes
No tears are shed,
For they freeze within the brain.
Nought is felt but dullest pain—
Pain acute, yet dead;

Pain as in a dream,
When years go by
Funeral-paced, yet fugitive;
When man lives and doth not live—
Doth not live—nor die.

In Siberia's wastes
Are sands and rocks;
Nothing blooms of green or soft,
But the snow-peaks rise aloft,
And the gaunt ice-blocks.

And the exile there
Is one with those;
They are part and he is part—
For the sands are in his heart,
And the killing snows.

Therefore in those wastes
None curse the Czar.
Each man's tongue is cloven by
The north blast, who heweth nigh
With sharp scymitar.

And such doom he drees
Till, hunger-gnawn
And cold-slain, he at length sinks there;
Yet scarce more a corpse than ere
His last breath was drawn."

Where among your drawing-room bards of fashionable pessimism are any verses regal and terrible as these? Be it noted they do not arraign Heaven; nor here nor elsewhere does he excuse or luxuriously pity and fondle himself, this poet of the depths.

Of his translations the most often printed in the ballad books are those from the Gaelic: The "Testament of Catheir Mor," "Dark Rosaleen," "Lament for the Princes of Tyrone and Tyrconnell," and "The Woman of Three Cows."

"Oh! think of Donnell of the ships, the chief whom nothing daunted;
See how he fell in distant Spain, unchronicled, unchanted!
He sleeps the great O'Sullivan, where thunder cannot rouse;
Then ask yourself, should *you* be proud, good woman of three cows?"

And many more. Instead of giving any of his ballads—for to quote at length is not possible, and to quote piecemeal is scant justice to any poem with a story—I give a few stanzas of his version of those curious rhymes by King Alfred of Northumberland descriptive of Ireland, whither he had gone in youth to be educated:

"I found in Innisfail the Fair,
In Ireland, while in exile there,
Women of worth, both grave and gay men—
Many clerics and many laymen.

* * * *

Gold and silver I found, and money,
Plenty of wheat and plenty of honey;
I found God's people rich in pity,
Found many a feast and many a city.

* * * *

I found the good lay monks and brothers
Ever beseeching help for others;
And in their keeping the Holy Word
Pure as it came from Jesus the Lord.

I found in Munster, unfettered of any,
Kings, and queens, and poets a many—
Poets were skilled in music and measure—
Prosperous doings, mirth, and pleasure.

* * * *

I found in Ulster, from hill to glen,
Hardy warriors, resolute men—
Beauty that bloomed when youth was gone,
And strength transmitted from sire to son.

* * * *

I found in Leinster, the smooth and sleek,
From Dublin to Slewmargy's peak,
Flourishing pastures, valour, health,
Long-living worthies, commerce, wealth.

* * * *

I found strict morals in age and youth,
I found historians recording truth.
The things I sing of in verse unsmooth
I found them all; I have written sooth."

A very different ancient Ireland from the barbarous place some have imagined. To almost everything he gave a rueful and visionary tinge. You must not go to his work for delicate grace or tender pity, for such are the expressions of the happy moments of usually happy men, but for desolation and sympathy with whatever is barbaric in men's hearts.

It is not possible to imagine two men more different than Clarence Mangan and Thomas Davis—the one absorbed, moody, and morbid, in penury, one of the people, wilful and self-taught, wasted by routine; the other, university trained, a man of action, patient and gay, one of the gentry, surrounded by friends. The one wrote because he was miserable, the other wrote because he was happy and noble and wished to make others so. Thomas Osburne Davis, Ireland has no name more widely loved, no more potent maker of opinion. At college in no way different from his fellows save in his contempt for the oratorical honours of the Debating Society, few would have imagined him destined to lead a rebel party. He was twenty-seven before he made a single verse, and then only because his "young Irelanders" felt the need of ballads for the "Nation" newspaper, started in 1842; and all he wrote was done within the limits of a year and a half. In 1845 he died. Diverse parties—the O'Connellites whose power he had broken, and they to whom his ideals were a veritable fire-pillar, and they who held them the merest Jack-o'-lantern flickerings—all trooped to his funeral. Fergusson wrote his burial ode:

"I walked through Ballinderry in the spring-time,
When the bud was on the tree;
And I said, in every fresh-ploughed field beholding
The sowers striding free,
Scattering broadcast forth the corn in golden plenty
On the quick seed-clasping soil,
'Even such, this day, among the fresh-stirred hearts of Erin,
Thomas Davis, is thy toil!

I sat by Ballyshannon in the summer,
And saw the salmon leap;
And I said, as I beheld the gallant creatures
Spring glittering from the deep,
Through the spray, and through the prone heaps striving onward
To the calm clear streams above,
'So seekest thou thy native founts of freedom, Thomas Davis,
In thy brightness of strength and love!

* * * * *

Young husbandmen of Erin's fruitful seed-time,
In the fresh track of danger's plough!
Who will walk the heavy, toilsome, perilous furrow,
Girt with freedom's seed-sheets now?"

Many a fine war-ballad has he left us, many a fine war-song. Of the first, the most notable being "The Sack of Baltimore," a history of a descent by Algerian pirates on the Irish shore, written just before his death; of the last, the song, "Oh, for a sword and a rushing steed." Yes, Ireland has no name more beloved. Often have I heard the children of the people singing his songs, putting their whole soul therein. There are concerts where all the singers are children and all the songs are his—their beloved. Here is one I have heard well rendered:

"Oh! the marriage, the marriage!
With love and *mo bhuachaill* for me;
The ladies that ride in a carriage
Might envy my marriage to me.
For Eoghan is straight as a tower,
And tender and loving and true;
He told me more love in an hour
Than the squires of the county could do.
Then, oh! the marriage! etc.

His hair is a shower of soft gold,
His eye is as clear as the day,
His conscience and vote were unsold
When others were carried away.
His word is as good as an oath,
And freely 'twas given to me;
Oh! sure 'twill be happy for both
The day of our marriage to see.
Then, oh! the marriage! etc.

His kinsmen are honest and kind,
The neighbours think much of his skill,
And Eoghan 's the lad to my mind,
Though he owns neither castle nor mill.
But he has a tilloch of land,
A horse, and a stocking of coin,
A foot for a dance, and a hand
In the cause of his country to join.
Then, oh! the marriage! etc.

We meet in the market and fair,
We meet in the morning and night;
He sits on the half of my chair,
And my people are wild with delight.

Yet I long through the winter to skim—
Though Eoghan longs more, I can see—
When I will be married to him,
And he will be married to me.
Then, oh! the marriage, the marriage!
With love and *mo bhuachaill* for me;
The ladies that ride in a carriage
Might envy my marriage to me."

Of his political poetry I cannot speak; suffice it to say it still goes on, whether for good or evil, serving its purpose, making opinion.

Perhaps reading and reasonable Irishmen should put Fergusson where they put Mangan, at the head of their poets. He has not the other's lyrical intensity, but his power is more serene and lofty. His ballad, "The Vengeance of the Welshmen of Tirawley," is admittedly the best of Irish ballads, and in some ways the most Homeric poem of the century. His "Conary" is the most perfect equivalent for the manner of the ancient Celtic bards in modern literature. The very breadth and serenity of Fergusson has robbed him of popularity—there is an antique coldness about him. I heard him discussing a few months before his death some recent decorative architecture. To him it seemed florid and unimpressive. He preferred the plain building of earlier times. This severity of mind is in all he wrote. When reading the "Welshmen of Tirawley," or his more recent "Conary," one seems to be listening to some old half-savage bard chanting to his companions at a forest fire. If we long, while listening, for the more elaborate music of modern days, the fault is in us and in our time. The lives of Mangan and Davis were short and crowded with incident. The life of Fergusson was long and uneventful. He died some three years since, full of years and honours. A collected edition of his poems and prose writings—he was a noted antiquarian and old-fashioned romance writer—has been coming out in shilling volumes since his death.

In the little blue ballad books there is many another name dear wherever the Irish are—Griffin with his "Gille Machree," and Banim, truer to peasant nature and mother earth, with his famous and typical "Soggarth aroon" (priest dear).

"Am I the slave they say,
Soggarth aroon?
Since you did show the way,
Soggarth aroon,
*Their* slave no more to be,
While they would work with me
Ould Ireland's slavery,
Soggarth aroon?

Why not her poorest man,
Soggarth aroon,
Try and do all he can,
Soggarth aroon,
Her commands to fulfil
Of his own heart and will,
Side by side with you still,
Soggarth aroon?

Loyal and brave to you,
Soggarth aroon,
Yet be not slave to you,
Soggarth aroon.
Nor out of fear to you—
Stand up so near to you—
Och! out of fear to *you!*
Soggarth aroon!

Who in the winter's night,
Soggarth aroon,
When the cold blast did bite,
Soggarth aroon,
Came to my cabin door,
And, on my earthen-flure,
Knelt by me, sick and poor,
Soggarth aroon?

Who on the marriage day,
Soggarth aroon,
Made the poor cabin gay,
Soggarth aroon—
And did both laugh and sing,
Making our hearts to ring,
At the poor Christening,
Soggarth aroon?

Who as friend only met,
Soggarth aroon,
Never did flout me yet,
Soggarth aroon?
And when my hearth was dim
Gave, while his eye did brim,
What I should give to him,
Soggarth aroon?

Och! you, and only you,
Soggarth aroon!
And for this I was true to you,
Soggarth aroon.
*In* love they'll never shake
When for ould Ireland's sake
We a true part did take,
Soggarth aroon!"

And Keegan, the farm-labourer, and Frazer, the weaver, and Florence McCarthy, whose work was more of the fancy than the heart, and Darcy Magee, afterwards assassinated, and rebel Doheny, with his one memorable song, written as he lay in hiding, and Gavan Duffy, and Ingram with his famous "Memory of the Dead;" and later on in Fenian times, Casey, with his "Rising of the Moon," and Kickham, Fenian leader and convict, most rambling and yet withal most vivid, humorous, and most sincere of Irish novelists, with his ballad of "Blind Sheehan," and his "Irish Peasant-girl;" and Joyce, with his many ballads, also author of a national epic, that reached, it is said, a sale of ten thousand copies in a few days, mainly among Irish Americans; and in our own times Alfred Percival Graves, with his

"Little red lark
Like a rosy spark,"

and his "Father O'Flynn;" and many more besides these, anonymous and named. Others

again whose work is in the main written for the few, have yet occasionally reached the people, like Allingham, with his "Fair Maid of Ballyshannon," by the help of music, or, like De Vere, through the ballad books.

The English reader may be surprised to find no mention of Moore, or the verses of Lever and Lover. They were never poets of the people. Moore lived in the drawing-rooms, and still finds his audience therein. Lever and Lover, kept apart by opinion from the body of the nation, wrote ever with one eye on London. They never wrote for the people, and neither have they ever, therefore, in prose or verse, written faithfully of the people. Ireland was a metaphor to Moore, to Lever and Lover a merry harlequin, sometimes even pathetic, to be patted and pitied and laughed at so long as he said "your honour," and presumed in nowise to be considered a serious or tragic person. Yet the poetry of the men I write of is above all things tragic and melancholy. We must not seek, however, from these, or any other makers of popular song and ballad, the same things we love in more studious writers. The grass is merely green to them and the sea merely blue, and their very spontaneity has made them unequal. But a wonderful freshness and sweetness they have, like the smell of newly-ploughed earth. They are always honest companions; no one of them wrote out of mere vanity or mere ambition, but ever from a full heart.

W. B. YEATS.

## TIGER JACK.

WITH AN ACCOUNT OF THE DEATH OF ONE OF HIS RELATIVES.

MANY of our readers will probably remember in our last November number a short account of "Jack," a young tiger cub which was sent by Sir Edward Buck, secretary to the Indian Government, to England, and after being domesticated in his brother's house at Upper Clapton, taken to his future home at the Zoological Gardens.

Jack is now over a year old, and one of the finest young tigers imaginable; very handsome and very playful, and still quite a pet, although Sutton, his keeper, has ceased to take him for his daily walk in the grounds after the departure of the visitors, as Master Jack has proved to be the "master." Although he would readily enough leave his cage and enjoy a roll on the grass, yet the moment it became time for him to "go to bed," he began to prove restive, and at last it required the united efforts of three keepers to take him back to the lion house, his growls meanwhile being rather too suggestive to be quite pleasant. Poor Jack, therefore, has now to remain night and day in his cage, where, however, he seems quite happy and contented, and always seems to remember, and greets with a purr, his former host at Clapton, whom he still allows to coax and fondle him. It will be another year and a half before Jack attains his full growth, and long before that time it is feared he will assume his natural savage nature, and the coaxing and fondling will have to be one of the happy memories of the past.

Jack, however, up to the present time is quite harmless, and is so much admired that several photographers, amateur and professional, have obtained leave to take his likeness; but not only photographers, but well-known artists have also portrayed him, and Jack's model in bronze by Mr. Swan, R.A., entitled "A Young Himalayan Tiger," which was exhibited at the Royal Academy this year, was so beautifully executed that it was at once secured by Sir F. Leighton.

It might be noted, by-the-by, that several handsome offers were made for "Jack" on his arrival at the docks by various dealers and others; and the writer of this article received a telegram two days after Jack's sojourn at Clapton, offering a large sum of money for him.

In India as much as 1,500 rupees have been offered for the head of a man-eating tiger, and most thrilling are the accounts of the narrow escapes incurred by those attempting to obtain the coveted reward.

In England, however, the live beast is required, but tigers are rather scarce, and even at Jamrach's famous establishment of wild beasts a young tiger is not always obtainable. The selling value of wild beasts of course varies considerably. Two hundred pounds is sometimes asked for a royal Bengal tiger, whilst a lion, but not a first-rate one, may be obtained for seventy pounds. An elephant would cost an anxious buyer about three hundred pounds, but he could increase his stock of ourang-outangs at an expenditure of twenty pounds.

A letter from the writer's son in India, with a long account of the death of a man-eater, brought so vividly before his mind his guest of last year that possibly the readers of the "Leisure Hour" may be interested in a few of the details, particularly as it is believed that the tigress in question was a near relative of "Jack's."

It appears that a man-eating tigress, with her family of cubs, have haunted the forests of Jounsar, a few miles north of Chakrata, a hill station in the lower Himalayas, N.W. Provinces, for the last few years; and numerous are the victims that have fallen to their insatiable craving for human flesh. For years past it has been considered unsafe for solitary persons to travel over the hills this tigress frequented; and the neighbouring hill-men invariably went about in large parties, and never except in broad daylight. Such was the terror this brute had inspired far and wide. With the incentive of a Government reward of five hundred rupees, several attempts had been made from time to time to destroy the

uncanny brood, and rid an otherwise charming country of her pestilential presence. But although one or two tigers have been shot in the district, the real man-eater herself was never met with, and she carried on her man-slaughtering propensities with impunity till a few weeks ago.

Of the many blood-curdling and strange stories told of her misdeeds, perhaps the following bears the palm.[1]

Some six years ago she was seen with two young cubs who seem to have been chiefly brought up on human flesh, from the number of the killed and missing heard of in those days. About the same time a small gang of Punjabi sawyers, who had been paid up by the Forest Department, and were making their way home through the hills, happened, unfortunately for them, to cross the tigress's beat, though previously to that she had not been heard of for some weeks.

After a long and tiresome march they had safely reached the chowki at Loquar in Jounsar before the evening sun had set. After an early meal they all retired together for greater safety to a grass-and-wattle shed in the compound. The forest chowki here is situated near a lonely and densely wooded glen. With the tigress about nobody could be got to stay, and the forest chowkidar lived some miles off in a neighbouring village. Well, to my story. It was early in the evening, about nine or ten o'clock, when the occupants of the hut were suddenly roused by the death cries of one of their comrades, who was being forcibly dragged out by his heels through an opening in the grass-and-wattle side of the hut! They all rushed out, and, to their dismay and horror, saw the man-eater of the hills calmly carrying off their unfortunate friend to the bed of a stream a short distance below, from which direction two young cubs were now distinctly seen advancing. The sawyers had no weapons with them, yet they made a bold attempt to effect a rescue. They followed and yelled, threw stones and flourished firebrands in her face, but she never relinquished her hold till she reached her cubs. Then, suddenly dropping the now unconscious man, she turned savagely and scattered her pursuers. After this, thinking their late comrade dead and beyond human aid, they considered discretion the better part of valour, and immediately swarmed up the nearest trees. Here they intended to wait patiently for daylight. It was a soft summer night, with scattered fleecy clouds about, which occasionally obscured the otherwise brilliant moonlit scene beneath.

The men had not been long in their coign of vantage when they were made the unwilling witnesses of a most ghastly tragedy. The tigress went back after charging, and stood over the prostrate form of her victim and purred in a cat-like self-complacent way to her cubs, who were romping about and rolling over the apparently lifeless body. She then lay down a few yards off, and with blinking eyes watched the gambols of her young progeny. Somehow the watchers in the trees thought they saw the body move. Yes! the man was still alive, and in a few moments sat up and tried to beat the young brutes off.

They were too young to hold him down, so he made a desperate attempt to shake himself free, and started off at a run. But before the poor wretch had gone twenty yards the tigress bounded out and brought him back to the cubs once more. He made two or three more attempts to regain his freedom, but was seized by the old tigress and brought back each time before he had gone many yards. His groans and cries for help were heart-rending, but the others on the trees were paralysed with fear and quite unable to move. At last the tigress herself joined in the gambols of her cubs, and the wretched man was thrown about and tossed over her head, exactly as many of us have seen our domestic puss throw rats and mice about before beginning her meal on them. The man's efforts at escape grew feebler and feebler.

The last time they saw him try to get away was on his hands and knees towards a large fig tree, with the cubs clinging to his limbs. But it was of no avail, and we will spare our readers the terrible details of the end of the unfortunate victim, who happily fainted before his death.

It was this tigress that Mr. Ormaston, a young officer of the Forest Department, has had the good fortune to slay under unusual circumstances. With others of the Forest School students he was getting practical instruction in Indian forestry, a few miles beyond the station of Chakrata. They had heard of a buffalo having been killed by a tiger, and in the middle of the day Mr. Ormaston and Mr. Hansard, the latter a student in the Forest School, saw the man who had been set to watch the buffalo running back towards the camp.

On questioning him they found he had just seen the tiger coming up the ravine towards the dead buffalo. They immediately took up their rifles and went off in search. Keeping fifteen or twenty yards apart, they walked rapidly off. But they had not proceeded far when, without the slightest warning, Mr. Ormaston, who was below, heard a groan, and saw Mr. Hansard suddenly borne down to the ground with the tiger on his back. He was taken unawares, and it was a critical moment, but he stood his ground and kept his nerve, and in the next moment a 12-bore bullet went crashing through the tiger's spine. This brought her, mortally wounded, rolling down towards him, but a second well-directed shot stopped her further career. As the camp was only a few hundred yards off, Mr. Ormaston hurried off for assistance. On returning they found Mr. Hansard, who had evidently also rolled down the hill, lying insensible a few feet away from the long-dreaded murderous tigress of Jounsar. On regaining his senses he was removed to the Station Hospital, and eventually recovered. It is fortunate for the natives in India, who will almost worship a man-eater slayer, that our Indian Civil Service turns out such good sportsmen as Mr. Ormaston, who had only joined the Indian Forest Department some two months, and had never before been out tiger-shooting.

H. J. B.

[1] The details are taken from an article which appeared in the "Civil and Military Gazette," an Indian newspaper, in May last.

ITS HEROES AND HEROINES.

AT the beginning of this century there was living in London an old French gentleman, a refugee from the troubles of the Revolution, Monsieur le Baron de Montyon, to whose memory is attached the noble fame of a life devoted to doing good. He was a man who had made his fortune by his personal exertions. The son of an accountant, he was educated for a lawyer, and so talented and industrious was he that at the age of twenty-two he was admitted an advocate at the court of civil and criminal jurisprudence in Paris. Later on he obtained public employment, was made Councillor of State, and Governor of the province of Auvergne, in which position, it is said, he acquired the love, respect, and gratitude of all those over whom he had authority. But after a time he was removed from this post in order to make room for some special favourite of the Court, and after being appointed Governor of Marseilles was subsequently shifted to Rochelle, and in the end, being probably found too upright a man for the corrupt times of Louis XV, was deprived of office altogether. Upon the accession of Louis XVI, however, he was once more taken into royal favour, and filled the important position of Chancellor in the king's household, where, as elsewhere, he exerted himself to the utmost in doing all the good which lay within his power.

Then came the Revolution, putting a stop to Monsieur de Montyon's benevolent schemes, and sending him an exile, first to Switzerland and finally to England, to which country he had prudently transferred his fortune at the time when the French troubles first broke out.

Monsieur de Montyon lived twenty years in England, devoting his enforced leisure to scientific pursuits, and carrying on his work of benevolence among the French refugees who were at that time crowding into England, for the most part in a state of great poverty and distress. He also showed himself a little Providence to the poor French prisoners of war, who were in a pitiable condition of want and suffering.

Monsieur de Montyon was eighty-three years old when he returned to his own country in the year 1816, but even at this age he had still energy and spirit enough to take up again the broken threads of his life's work, and up to the very day of his death, four years later, was engaged in organising schemes of public usefulness.

He left a large sum of money to be applied to various benevolent purposes, among which are to be

found a fund for awarding prizes for improvements and useful discoveries in surgery and medicine; a fund for the relief of convalescent hospital patients; a fund for granting small annuities to poor infirm persons; a fund for restoring to the poor useful articles under the value of five francs each, which they might have been driven to pledge without prospect of redeeming; a fund for granting prizes for good conduct to soldiers' children; and also a fund for providing annual prizes for acts of virtue or heroism in humble life.

The last is perhaps the greatest and the most popular of all the Montyon endowments, being also, so far as we know, unique in its kind, and productive of many good results. About £800 is annually distributed in various sums by the French Academy, who in this matter act as the executors of Monsieur de Montyon. All the departments of France have an equal right to put forward candidates, but the power of nominating them is vested entirely in the local authorities, and the memorial as to each particular case must be signed by a number of persons of weight in the neighbourhood, who are each individually responsible for the truth of the statement made. The statement itself is compelled to be extremely minute, and every possible precaution is taken to prevent imposition. The cases are then presented to the Academy, and proportionate sums are awarded out of the fund—the object being to seek out homely virtue, and by public appreciation to encourage rather than to reward it.

To quote the words of an eminent French statesman on this subject, "The Academy does not desire that the sums it offers should be regarded as any payment for the good deeds of the recipients. These men of heroic courage, these noble, self-sacrificing women will elsewhere receive their due recompense. The French Academy simply delivers the pious legacy which has been confided to its care. At the same time it takes pleasure in proclaiming these noble actions far and wide, not for the gratification of personal vanity, but that the recital may create in the hearts of all who hear a love of virtue and a desire of imitation."

The following life-stories are taken from among many striking examples of noble self-devotion which the French Academy has recognised, and of which it has preserved the record.

## I.—HENRIETTE GARDEN.

IT was as miserable a day as could well have been seen on either side of the Channel; the wind swirling in great gusts and scattering the ripe and unripe apples, with which the great Norman orchards were laden, in soddened heaps at the roots of the trees; and the rain pelting, pelting down to the earth and half a yard up from it again, as though in protest against being sent where it felt itself unwelcome. The sky was of that peculiar murky hue which we take a melancholy pleasure in claiming as especially English. But out upon such a sky, and upon such a prospect of wind-driven water, looked Henriette Garden on this August day, pressing her nose against the tiny panes of the cottage latticed window till the moisture within rivalled the moisture without, and the whole world became to her for the moment an indistinguishable mist.

There was no road up to the cottage; only a path leading to it through a rather untidy little farmyard, where a family of ducks was waddling about in the mud; but from the corner where Henriette stood, a glimpse of the highway could be got at a somewhat difficult angle, and it was on this point that the young girl's eyes and hopes were riveted.

Sundry times the provoking little panes of glass were rubbed by the corner of the young girl's apron, and more than once an excited little exclamation escaped her, as her ear caught, or fancied it caught, some sound in the distance which might possibly bring with it that for which she was looking; but the sound died away or proved fallacious, and the panes grew dim and misty again, and the rain pattered viciously against them, and the wind blew and almost put out the sputtering logs in the big chimney, and nothing else happened.

"Do you think, *ma cousine*," said the young girl, suddenly turning round to speak to an old woman in a chocolate-coloured jacket and big blue apron, who sat knitting by the hearth, "do you think that he is not coming to-day after all?"

The old woman shrugged the shoulders which were covered by a brown cotton jacket.

"Who can say?" she answered, sententiously. "And in such a storm!" But as she turned to pick up a fallen stick and lay it on the fire, she muttered, "He has not been in any hurry to come these ten years past, so it is hardly likely he will take too much trouble now."

"Did you speak, *ma cousine?*" asked the girl, turning her head.

"How can you hear what I say when you stand with your nose nailed to the window, and the wind and the rain making such a clatter without?" returned the old woman. "I was saying, or meant to say, that any sensible girl would know very well that no one, not even a father, who naturally is anxious, most anxious—Hem! What was I saying? What do you say? He is here. *Possible!*"

For, with a bound which had sent two chairs sprawling on the brick floor, and had almost turned *la cousine* herself head over heels, Henriette had rushed to the door, which opened into the room, and stood there on the doorstep with flushed cheeks, trembling limbs, and a heart whose beat-

ing, to her ears, made a noisier echo than any that the hurricane could create, while the wind and the rain dashed at her and drove past her.

The one great and longed-for event of her young life was about to happen—had happened. Her father had come!

Two figures were apparent, driven along by the wind and the rain through the slough into which the ill-defined path which led from the road to the cottage was fast developing. One man wore a blue cotton blouse and carried a small portmanteau under a big red cotton umbrella. The man who followed him had his coat buttoned up, and also carried a big cotton umbrella with much discomfort to himself. He was short and stout, red faced, and smooth shaven, except for a tight little imperial on his chin; and had altogether the air of a man to whom a fight with the elements offered no particular attraction.

Just as he was making a rush for the open doorway where Henriette stood, the wind caught him and his umbrella in a kind of fury, making a mad attempt to lift them bodily over the house; but with a violent effort which left him redder in the face than before, Monsieur Garden regained his footing, reefed his sail, and at length found safe harbour from the storm within the friendly doorway.

The first words which Henriette heard from her father's lips were not precisely words of blessing, rather the reverse, and perhaps, under the circumstances, he should not be too severely blamed. But the meeting was not quite all that the young girl had looked forward to through the long years, and rehearsed to herself in many a happy hour of joyful expectation.

Indeed, Monsieur Garden did not appear to see, or if he saw he did not at first take any notice of Henriette.

*La cousine*, or Mademoiselle Martha, as she was always called in the village, came forward to take the troublesome umbrella, from which a stream of water was trickling on the brick floor, and to relieve the man in the blouse of the portmanteau.

"What a storm!" she said, in sympathising tone. "Are you wet, Monsieur Garden? You have had an unpleasant journey, I fear."

"Unpleasant!" returned the traveller; "unpleasant isn't the word for it. It's a vile journey," he went on, sinking into the chair which stood beside the wood fire, and kicking the logs viciously with his foot. "And what a hole of a place when one gets to it. How on earth do you manage to live in such a den, Martha?" This was the first sign of recognition which Monsieur Garden had bestowed upon the woman who had for years been a mother to his motherless child.

Mademoiselle Martha smiled, and shrugged the shoulders under the brown cotton jacket.

"We have managed to be pretty content this good long while, Henriette and I," she said. "You will not think it so bad when the weather is fine. And now, Henriette, my little one, come and speak to thy father. You are so grown he hardly knows you," she added in an undertone by way of encouragement, patting the girl on the back.

Henriette came forward very timidly. She did not know what to do,—the meeting was so utterly different from all her preconceived notions of what it would be. She had always imagined herself as rushing into her father's arms after the fashion of a certain long-lost child she had read about in a story-book; or, she had thought, if her father had turned out to be someone very grave and dignified, like *Monsieur le Curé*, that she would kneel down before him and ask his blessing. But now that she had come face to face with Monsieur Garden she could neither fly to his embrace nor bend before him in reverence. She could only stand shy and trembling, very red in the face, and clinging for support with tight hold to *la cousine's* hand.

Monsieur Garden looked at her, and saw a tall awkward blushing girl of fifteen, in a rather short and scanty cotton frock, and a blue apron, with big hands and feet, the former redder than was becoming, and with a good quantity of reddish hair drawn back tight from her face, and hanging in a thick pigtail down her back.

"Umph!" said Monsieur Garden. "That is my daughter. A big girl, indeed!"

"And a very good one," put in Mademoiselle Martha, in a kindly tone of recommendation.

A peculiar smile twisted the corners of Monsieur Garden's mouth. "She will need to be something," he said, in a sort of aside; "she is not beautiful!"

Subsequently Monsieur Garden and Mademoiselle Martha had more than one conversation on the subject of Henriette's future.

Monsieur Garden had come to the Norman village with the avowed intention of claiming his daughter and taking her home with him.

"But why?" Mademoiselle Martha argued. "If you are, as you say, disappointed in her, why do you make any change? I am willing still to keep her. I have come to love her. I do not think her ugly. She is happy here with me, and, by-and-by, I shall be able, I have no doubt, to arrange for her marriage with some honest farmer. She is thought much of among our people here."

"In the kingdom of the blind the one-eyed is king," said Monsieur Garden, sententious but uncivil.

"If you had wanted her to turn out a brilliant sort of girl you should not have had her brought up in a poor Norman village," said Mademoiselle Martha. "When she was a child you were glad enough to get rid of a troublesome burthen. I have done my best for her and for you. If you are not desirous to have her now I will still keep her."

"No," said Monsieur Garden. "I am alone. I want somebody to keep my house. If Henriette has been properly brought up she should be capable now of doing that. It is not right for a father to be served by strangers when his own child is to be had for the taking. Let her come and do her proper work."

So two days after Monsieur Garden's somewhat

inauspicious arrival, on a day as blue and golden as that other was grey and dreary, Henriette and her little hair trunk were escorted to the diligence by a group of half-envious but wholly regretful villagers. Mademoiselle Martha was there, it need scarcely be said, and Old Pierre, of course, to carry the trunk; and there also were Madame Cordier and her son Jean, and Ambertine Jarnac, and the three sisters Boipon. Henriette kissed one and another of her friends with trembling lips on each and all of their sunburnt cheeks. Then, as she gazed round her at the dear familiar fields and orchards and red-tiled houses, which she would see no more; and as at last they were all lost to view—even *la cousine's* big waving pocket-handkerchief—in a blinding cloud of dust, then the young girl felt, indeed, not that she was just beginning life, but as though she were paying her last adieu to it.

In a few minutes, however, she had choked down her tears, for she thought they seemed to annoy her father, who, on this occasion, did little but wipe his forehead with his large pocket-handkerchief, and complain of the heat as bitterly as he had two days previously complained of the rain and the cold. And by the time the next village was reached Henriette had begun to look up, to take a little interest in things around her, and to wonder about the great wide world into which she was entering.

The "world" which was actually waiting for her was the grand old city of Rouen, in which her father occupied some sort of position in the law; but it did not prove, on the whole, a very gay or even cheerful world to Henriette. Of course there was always the city itself, wonderfully stirring and exciting in its life and movement as it seemed to the village-bred maiden. And there was the glorious cathedral, and the crowded market-place, and, perhaps best of all, the lovely river, with its changeful lights and shadows, and its crowds of vessels and barges always shifting and full of interest. There was all this to see when Henriette could snatch half an hour from her work at home to run out on some errand. But this was not often, for she found her time pretty well occupied with domestic concerns.

Monsieur Garden had, indeed, a servant or housekeeper, but it was, perhaps, because Françoise was, after a good many years' service, getting old and incapable of hard work, that he had now bethought him of fetching home his daughter. As for Henriette, it did not occur to her any more than to her father that she was to assume the position of mistress over Françoise, and Françoise on her side soon made it evident that what she wanted and was determined to have was no mistress, but a servant absolutely under her command. In effect, that which was hardest, most fatiguing, or disagreeable in the housework fell by degrees to the lot of Henriette, and she, partly through ignorance and partly through sweetness of disposition, easily fell into the position assigned her.

Her father made no kind of protest, and indeed, so long as his little dinners, of which he partook in solitary state, were well cooked and served, his shirts well ironed, and all his small wants attended to, he cared very little to whose thoughtfulness he owed his comforts. Perhaps he, at one time, had a notion that his daughter might turn out to be brilliant in some way. She was not brilliant. She would never, he could see, be anything of a social success; and, therefore, it suited him, and, as he may have argued, suited her better too, to make a kind of Cinderella of her.

So the years passed on. Henriette developed from a raw awkward girl into a rather plain and shy young woman, and the only change which occurred in the dull routine of the Garden household was the death of old Françoise. When she became ill and quite incapable of work, Monsieur Garden would have sent her out of the house; but Henriette pleaded so hard that she might be allowed to keep and nurse her that her father consented, on the distinct understanding that his comfort was in no way to be interfered with. Henriette nursed the old woman for some months, till she died, and then lived on alone with her father; for it never occurred to him that the girl needed any kind of assistance in her work.

Though Monsieur Garden occupied a fairly good position in the town, and went into some society, he never happened to mention the fact to his acquaintances that the young woman who was his servant was also his daughter; nor did he ever, on any occasion, show himself in the streets in Henriette's company. At the same time her father was never absolutely unkind or personally cruel to her; and Henriette was faithful in her own mind to the ideal which, long years ago, she had set up and enthroned there. He seemed at an immeasurable distance from her, infinitely above and superior to her—like the saints in the cathedral niches, perhaps—only that even to her prejudiced eyes it was difficult to make her father pose as altogether and quite a saint. Rather she compared him to some mighty monarch of the East, whose subjects think themselves happy if they are allowed now and then to approach and kiss his footstool. The girl would have been happy had any such approach to familiarity been permitted her. Her natural place was, however, she felt, to admire respectfully from a distance, and this she did with the fine unreasoning devotion with which simple noble minds are often, in this world of contraries, led to regard base and vulgar natures. Henriette was therefore all the more startled, and, as it were, fascinated, when one evening as she was clearing away her father's third course, and was just putting before him the little cream-cheese, and the few odds and ends, nuts, grapes, biscuits, and bonbons, which he always took in the way of dessert, Monsieur Garden rose and laid his hand upon her shoulder.

"My child, I have some news for you," he said, and his tone and manner were so unusually kind—indeed, affectionate—that Henriette blushed and trembled, and almost dropped the tiny salad-bowl and the remnant of the grilled chicken which she held in her hand.

"News, my father?" It was very seldom indeed that she ventured so to address him, but the word seemed to come naturally from her now, in response to his own warmth.

"Yes," said Monsieur Garden; "it may surprise you. At the same time," he continued, standing before the mirror which surmounted the red velvet mantelshelf, and peeping at himself between the gilt clock and the big glass cases of sham flowers; "at the same time, how often has one said to me, 'Why, Monsieur Garden, should a man at your time of life, with all your advantages —*assez bel homme!*—why should you not?' And that is what I am going to do."

"What are you going to do?" asked Henriette, all in a mist.

"I am going to get married."

Henriette stared open-mouthed. So little of marrying or giving in marriage had come into her life that a man who was going to be married seemed a natural curiosity to her. Then suddenly a sort of tumult seized her and made her head spin round. An idea, a wonderful possibility, occurred to her.

"And shall I, shall I indeed, know what it is to have a *mother?*" she asked, clasping her hands together.

"How strange, to be sure," cried Monsieur Garden, "that people always seem to think of themselves first. One would have fancied now that your first thought here would have been of me. However—well—no, I hardly think that—the lady—would—umph—" He hesitated. "In fact she is a lady occupying a fine position, a wealthy lady. Yes, and, in short, she does not as yet know that I have a daughter; and, perhaps, under the circumstances, there would be no use in giving her the information."

"But—" began Henriette.

"Ah, yes; you are naturally thinking of yourself again. Well, I have also thought of you. I shall leave you in possession of everything," pointing magnificently round the room to six chairs ranged against the wall on very shaky legs, "and I shall make you a certain allowance. There is an *appartement* in this house *au cinquième* now vacant, and which I think will hold all your furniture. I have already spoken to the *concierge* about it. You can move in there next week when I have left."

"Next week!" echoed Henriette.

It was as though she had been struck. She staggered under the blow. To be sure her father had not been very companionable or kind, or even generous to her, but he had been there to be worked for and waited upon, and adored at a distance; and now he was to disappear from her horizon, and she was to be left, mistress, it might be, of all she surveyed, in her garret, but alone, altogether and absolutely alone. *La cousine* was dead, and old Françoise was dead, and she had no friends, scarcely anything approaching to an acquaintance, in all the wide world; for the village people who had been her friends in the old times were now—who could tell where? Scattered or dead, or grown out of her knowledge, as she had grown out of theirs.

"Shall I never see you, will *she* never let me see you any more?" Henriette asked, a sudden hatred and fear of the unknown woman entering her mind.

"Bah! what has she to do with it?" returned the bridegroom elect. "Oh yes, I shall come and see you when I can, of course, and if you behave yourself properly, I have no doubt it will all turn out very well for you. But now you had better think of *me* a little, if you please, and see about getting my clothes washed and put in order."

And so the second great event of Henriette's life had come to her.

Five years ago her father had been granted to her prayers. He had proved not altogether an unmixed blessing, but he had been the whole source of her life's interest, and now he was to be taken away again; and Henriette felt as forlorn as Elsa when her Lohengrin disappears from her sight over the rippling blue waters.

Monsieur Garden was not a very romantic nor a very beneficent Lohengrin, but he embodied all that was given to poor Henriette's adoration.

The garret to which, by her father's thoughtful care, Henriette was relegated, had at least one grand attraction for the girl. This was that from it, over the tops of other houses, there could be got a peep of the shining noble river, with its panorama of moving vessels, which was an intense boon to the lonely girl, and sometimes kept her, as she believed, from giving way and despairing altogether. As it was, the busy yet tranquil scene thus lying at her feet seemed to suggest to her the thought that in labour of some kind or other is contentment alone to be found, and that she, like the rest of the world, must be up and doing.

Truth to say, Henriette soon discovered that the very small allowance granted her by her father's generosity was little more than sufficient to pay for the rent of her room, and that if she would eat she must also earn wherewith to buy food. Roused by this fact, she turned about to consider in what manner she could gain a living. It was not easy. She was now twenty-one years old, with no education to speak of, no trade, no special knowledge of anything.

While she was hesitating whether it would not be better for her at once to enter some household as a domestic servant, an opportunity offered which she eagerly availed herself of. Some children in the floor beneath her took fever. She offered herself as sick nurse, trusting to her womanly instincts and the little experience she had had at the bedside of old Françoise. Her services were gladly accepted, and she carried her patients safely through the crisis.

There happened to be much sickness that year in Rouen, and soon Henriette found her patients increasing rapidly. She was not eager to gain much money, and served the poor as willingly as the rich. The little food that she ate was, she considered, a sufficient payment for the work she did. But after a while she had also to add to this the weekly price of her rent. For the allowance promised by her father, at first paid somewhat

irregularly, after a while ceased altogether, and Henriette was thrown entirely upon her own resources. The money, however, which was paid by her richer employers enabled her to devote herself with equal assiduity to her poorer neighbours; and so, striking an even balance, she was able to exist, and even now and then to lend a helping hand to others less fortunate than herself.

During an attack of cholera which devastated the town some years later Henriette was much in request, and was one evening sent for in great haste to a fine house on the outskirts of the city, a servant who had come for her accompanying her to show the way.

"Monsieur was very bad," he said, "and Madame had gone off straight to Biarritz. Madame didn't like illness, and was horribly frightened of the cholera—and no blame to her!"

Henriette—Mademoiselle Henriette, as she was called in her work—went with the man, eager to do good, and asking no questions. The account of the illness was much the same as she had often heard before. But when she entered the sick room, and approached the bed on which the sufferer lay, her heart almost stood still, for, despite the darkened room and the changed form of the man who lay writhing in agony, with a face grey and wizened, looking twenty years older in half the number of hours, there could be no doubt that it was indeed to the bedside of her own father that she had been summoned.

"It is Monsieur Garden," she murmured, in an awed whisper to the servant who had accompanied her to the door.

"Yes, mademoiselle," said the man. "Do you know him? Have you, then, nursed him before? It was he himself who asked that you might be called in when all the others went away and left him. 'Send for Mademoiselle Henriette,' he said; 'she will come to me.'"

Henriette held her two hands tight over her heart to still its throbs. It was an intense happiness to her to feel that in the hour of trouble her father, still so tenderly beloved, had turned to her with the knowledge that her love would not fail him. With untiring devotion she now set herself to the task of soothing and ministering to the sufferer, who was almost beyond the point of recognising her or anyone about him. It was a severe struggle which was being waged between life and death, and for weeks the strong man lay weak as an infant in the clutch of the relentless enemy who had attacked him. But, contrary to the expectation of the doctor who attended him, and to the fears of the daughter who watched night and day beside him, and owing probably to her ceaseless care, he passed the crisis safely. When, according to the doctor's orders, a cart jolted up to the door with a coffin in it—for in cholera times no delays are permitted in France—the man who should have been ready for the coffin was lying in a quiet sleep with his daughter's hand in his, death, for the time at least, baulked of his prey.

After a while, however, there came to Henriette a certain sense of disappointment to damp the happiness which she had felt in devoting herself to her father.

When full consciousness returned to him a sort of uneasy, troubled look passed over his face as his eyes met those of his daughter; and at last, looking well round the room to be sure that no eavesdroppers might be near, he whispered, in an anxious tone of entreaty, "Do not betray me; no one knows anything. Give me your promise that you will keep my secret."

Henriette gave the desired promise, but her heart sank. Her father in his need was then willing to make use of her, relying on her tried affection, but he was not willing to acknowledge her. He had no affection to give in return.

A few days after this Henriette heard from the servants that Madame Garden and her daughters—for she had been a widow when Monsieur Garden married her—were about to return home. Henriette at once proposed that she should leave, since her services would no longer be required, but Monsieur Garden, with the peculiar selfishness of a selfish man in illness, strongly objected to such a course.

"I cannot spare my nurse," he said. "You must stay. *She* has no idea how to behave to an invalid. Why does she come back at all? I do not want her. But I want *you*, my child, I want you—and nobody need know," he added, in an earnest undertone of appeal.

To Henriette this climax was terrible. It was so sweet to her to feel that she was useful—so intoxicating to be assured by her father's own lips that he *wanted* her. And then, after being lifted up to this heaven of delight, it seemed all the harder to be at once hurled down again to the depths of despair by the cruel reiteration of the cry, "I am ashamed of you; I will not acknowledge you."

"Yes, yes," poor Henriette answered eagerly, anxious to assure her father that he need not grieve her by repeating what, alas! she understood only too plainly. "Yes, yes, as you say, no one need know, and I will stay with you as long as you need me."

In her own heart Henriette dreaded the return home of her father's wife more than she dared confess, even to herself. It seemed to her as though the task of concealing her identity would be hard before the keen eyes of a loving wife; and it also seemed to Henriette as though the mother for whom from infancy she had so longed was now to be held before her eyes only as a joy out of reach and forbidden. She schooled herself in many ways, by prayer and sternest resolves at self-suppression, to bear the sharpness of the coming trial. But the trial, when it came, was not by any means so severe as she had fancied it would be.

Madame Garden was, it may be presumed, not a specially loving wife, or her eyes were not sharpened to the extent which Henriette had feared. In truth, she troubled herself very little about either Monsieur Garden or his nurse. Henriette was not, either by nature or education, proud, and it did not, therefore, annoy her to be treated by her stepmother as a menial. Indeed,

on the whole, Henriette decided that she would prefer, were the choice offered her, not to enter into closer relationship with Madame Garden, and could by no means regret that the duty and affection of a daughter were not demanded of her.

The position was, however, at the best, a false one, and Henriette could scarcely regret the dismissal which she received from the mistress of the house some few days after her return.

"My husband is almost strong now and does not want a nurse any longer," said the lady. "You are only a useless expense, and," she added, "I suppose your wages have not been paid?"

"Monsieur Garden owes me nothing," said Henriette, warmly—and then adding, as she noticed the raised eyebrows of Madame, "I mean—of course, only one week, that is all, I can assure Madame."

Madame Garden shrugged her shoulders.

"You have known how to find your way to Monsieur's pocket. I am glad of it, believe me, but it is more than I have been able to do." Then she threw a piece of gold out of her purse on to the table at which Henriette was standing. "This, then, will settle matters with you. You may go as soon as you like."

Henriette took up the gold piece and put it into her pocket. After all, was it not earned? And from the presence of her father's wife she went straight to make her farewells to her father.

"Madame desires me to leave, and I think you will do well enough without me now," she said.

Monsieur Garden offered no objection, but his lips and hands trembled a little.

"Did—did she say you were to go?" he asked, weakly.

"Yes. But be sure," said Henriette, looking straight into her father's face, "be sure that at any time you may want me I am yours—yours only. Rely upon me."

Monsieur Garden looked up with something like moisture in his eyes, and held out his hand, but Henriette had gone, and he could only let it fall heavily down by his side, while a sigh, or it might have been a groan, escaped him.

Years later on Henriette was by chance sitting alone in the little garret with the view over the river where she still lived when not engaged in her usual work of nursing. But in truth the garret saw little of her now, for her fame had spread through the town, and she found herself very often in request. On this evening, however, she was for once idle, and in the dark she sat looking out of the open window, away over the river, where lights were beginning to twinkle and multiply themselves, and beyond this, at a dark belt of trees crowning a ledge of cliff, behind which she knew was the house where she had nursed her sick father. It was curious how often and how tenderly her thoughts went out towards that house, and towards the father whom she had tended as a mother might her child. The affection which Henriette in her girlhood had felt for her unknown parent had redoubled now that he had lain, helpless as an infant, in her strong arms, and had learned through all those weary weeks to look to her hand for life itself. But that was all very long ago now. Many years had passed over Henriette's head, leaving their trace in silver lines threaded among the brown of her hair. Since that time she had never seen her father, and only once heard of him. That was when, shortly after his illness, he, with his wife and wife's family, had moved away from the old house behind the trees to Paris, where it was rumoured he was making a large fortune by speculation. The old turreted house had long had other occupants, but Henriette could never pass by its gate without a thrill of emotion, such as a widow might feel on revisiting the spot where her honeymoon had been spent. In it the one little romance, or such it seemed to her, of her life had been passed. And that was now so long ago; so very long that unconsciously that time, and the time when her father first broke in upon her girl-life, seemed in her retrospect to be almost simultaneous. At least her thoughts ran easily from one to the other—from the daughter who had found her father sick and suffering, and tended him with a daughter's care, back to the time when the child was buoying herself up with day dreams of what her life beside her father would be. In her reverie Henriette passed again through that day of storm and tempest in which her father had first broken in upon her life. Indeed, as she gazed out over the river it seemed to her as if the very day itself had returned, for by one of the rapid changes not infrequent in Northern France, the hitherto calm and sultry evening had burst into a sudden passion of rain, with a sound of rolling thunder, rising higher and higher till it worked itself up into the fury of a storm, with vivid flashes of lightning, and long, loud reverberations. Henriette stood for a while at the open window listening to the thunder, and letting the rain drive in upon her. Perhaps it was this position which recalled to her mind so forcibly at the moment the day when she had stood in the pelting rain at the door of her cousin's cottage, to welcome her father, with all the bright hopes of her young life before her.

"How many years ago is that?" said Henriette to herself, musing. "Thirty? is it so many? Ah! how the time passes. And now I come to think of it, it was this very day—the last day of August. Strange that an old woman of forty-five should so keenly recall the feelings of a child of fifteen! Well! God's will be done," she added with a sigh, and closed the casement to shut out the driving storm.

As she did so a loud knocking at her door made her turn round.

"Mademoiselle Henriette, are you in?" asked a voice.

It was the voice of the *concierge* of the house.

Henriette went to the door and opened it.

"Yes, Madame Doban, what is it?" she asked in surprise, for it was unusual for the *concierge* to find her way up to the attic floor.

"Mademoiselle," said the woman, panting and sitting down on the first chair that offered itself, "there is a person asking for you below."

"Someone is taken ill, doubtless," said Henriette.

"I do not know, mademoiselle. The man—it is an old man—would not say what he wanted you for, nor where you were wanted for—and, to say truth, he had a look so wild and excited that I was unwilling to let him mount the stair, the more so as he is very dirty, and dripping with rain like a drowned dog."

"I will come," said Henriette; and as she passed lightly and swiftly down the many long flights of stairs, a strange, wild, improbable suggestion, that was half hope and half fear, shot across her brain. It almost seemed to her as though she had been expecting some one, and if some one, then whom?

She ran faster and faster the nearer she got to the courtyard, and it was with something like a cry of joy that she sprang towards a figure standing motionless in the dark little entry, its hands in its pockets, and its hat, from which water was pouring in little trickling streams, pushed over its eyes.

Though age and ruin and neglect had done their work effectually enough, there was not even a momentary hesitation on Henriette's part. She went to the bent, slouching figure, and laid her hand gently on the dripping sleeve.

"Father, you have come home," was all she said, but the tiny sentence—the tender intonation—implied volumes.

The old man turned and looked cautiously round him. "She would not let me in," he said; "she did not know me. So much the better. I do not want people to know me—you understand, Henriette."

"I understand," said his daughter, with a queer little pain dragging at her heart. "But come, we will go up. I—I seemed to have been expecting you all the day."

"You—you are alone, I suppose?" said her father, suspiciously.

"Quite."

She links the old man's arm in hers to help him up the long, steep stairs. She lights a fire in her room to warm and dry him; she sets before him all her small store of eatables; she makes up her own bed for his use, loading him with tenderest attentions; and from that day forth to the day of his death devotes herself to his service. He is very much broken, ruined alike in health and fortune; and only a very short time after seeking asylum with his daughter he is visited with a stroke of paralysis, which to a considerable degree affects his mind.

What are the circumstances which have led to his downfall from prosperity to destitution Henriette never knows, nor is she ever quite sure whether he is really in hiding, as he believes himself to be, from justice, or whether the idea is a hallucination. However this may be, he never leaves the house, and refuses absolutely to be seen by strangers.

The chief difficulty that Henriette experiences is that the work upon which she has hitherto maintained herself in tolerable comfort takes her much from home, and Monsieur Garden is urgent in insisting that she shall not leave him. What is to be done? Henriette at first refuses engagements, and lives upon some small savings which she has made, eking out her means by needlework with which some of her former patrons supply her. But she is not an adept in the art, and the savings are not long in coming to an end.

Monsieur Garden more than doubles the expenses of the little household, for his appetite is dainty, and he is even now apt to grumble a good deal if his tastes are not considered. It thus occurs to Henriette that, as her father sleeps well, and does not need her at night, and as, moreover, she has no bed upon which to lie, she might as well seek employment as a night nurse, and still perform all her usual duties with her father during the day.

This plan succeeds admirably, except that after a time Henriette finds herself utterly breaking down in health from the double strain put upon her, and she is compelled to give herself an interval of rest, during which one of the two who go to make up the little household lives almost on starvation diet. But that one is not Monsieur Garden! Afterwards Henriette determines that she will always allow herself two nights for sleep in the week, and pursue her avocation of night-nursing during the other five. This plan succeeds fairly well for about two years, at the end of which time Monsieur Garden becomes so ill that Henriette cannot venture to leave him by night or day. At this point every resource is taxed. The little rooms are denuded of their furniture. Everything that can be so transmuted is turned into money; and yet, though every spare moment is occupied in needlework, long arrears of debt are found accumulating upon Henriette. Her landlord and the tradesmen of the neighbourhood trust her, for they know her; but the burden is sometimes almost overpowering to the honest-hearted woman whose one pride through her long, solitary existence has been that of owing no man anything.

For the rest she is perfectly happy. The long-yearned-after blessing has been granted—her father loves her. And beside this untold boon other minor matters—such as poverty, privation, fatigue—are as nothing to her.

As the invalid's bodily strength gives way his mind also weakens, and gradually at the same time there seems to come over him a spirit of gentleness and calmness which is probably only a reflection of his daughter's constant influence, but which she welcomes with feelings of intense relief and gratitude. The sharp lines seem to die out of his face; the restless, uneasy watchfulness gives place to a look of quiet peace. The eyes no longer turn anxiously at every sound towards the door, but are content to follow the movements of Henriette as she crosses the room, or to rest upon her as she sits sewing by the bedside. Whatever anxieties or privations she, patient soul, may be suffering, no word of it escapes her. The sick man knows nothing and cares for nothing but that his wants are all supplied, and that his faithful nurse is ever at hand to tend and amuse him.

At last he is pleased to lie with his hand resting on his daughter's knee or shoulder while her busy fingers ply their ceaseless task, and her voice is occupied in amusing him as one might amuse an ailing infant. Sometimes she sings little hymns and songs to him, sometimes she tells him tales such as would amuse a child, or stories out of the Holy Book such as in far distant days her mother might have told her.

Henriette Garden was not, and never had been, to her father's disappointment, a brilliant woman. She had never been handsome, and he had despised her because she was plain and homely, and, as he thought, wanting. But now, in his last moments, it is upon her faded face that his eyes learn to linger with affection, and it is from her despised intelligence that he, the man of learning and accomplishments, draws his latest gleam of light, and from her teaching and example, it may be, his first hope of a purer and better life.

At length he passes away, and Henriette is herself laid prostrate with low fever of a severe type. She is taken to the hospital, and, to her intense horror, believes herself to be dying, for she cannot afford to die yet. Her life's work is not yet completed. She cannot die in peace with a load of debt upon her conscience! She implores the doctor, who has known her for many years in her work among the sick, to save her life, and tells him the reason of her anxiety. In an agony of mind she confides her story, or so much of it as is necessary, to him. The good doctor is so much struck and touched by it that he not only promises to use his utmost skill in restoring her to health, but communicates the case to the French Academy, by whom Henriette Garden, "the admirable daughter," is at once awarded a sum of money which not only relieves her from the pressure and distress of debt, but restores her to a position of comparative comfort.

After some months of slow convalescence Henriette attempts to resume her old occupation, but her health is shattered by the fatigues she has undergone, and before another year is over she follows her father to the grave, leaving as a legacy to the poor all the little wealth of which she is possessed.

L. G. SÉGUIN.

## Twilight in the City.

THE sky's still blue, but on St. Paul's
A rose-pink flush is spread,
Clear cut stand out the city walls
Against the west's faint red;
In streets the shadows creep about,
And one by one the lamps come out.

The sky grows dimmer—slowly fades
The rose flush from on high;
The darkness from below invades
The lovely lucent sky,
As earthly thoughts invade and blot
The soul where heavenly light is not.

The river still flows on—each bark
Moves safe—though day be done.
And on the Embankment thro' the dark
The lamps shine—one by one—
As hopes shine, when too hard to bear
Has grown the night of man's despair!

And this half-light—too clear for night,
Too tender-sweet for day—
Turns to soft grey life's black and white,
And shuts sad sights away.
So age brings to our tired heart's eyes
A veil—that's raised in Paradise.

# A CRUISE AMONG THE SOUTH SEA ISLANDS.[1]

## I.—CORAL ISLANDS.

LEADING an idle life in Honolulu last autumn, and wondering what would be the next phase of my wandering existence, it was with no little delight that I seized an opportunity that offered itself of visiting some of the southern islands of the Pacific Ocean. I had long possessed an ambition to do so, but to carry out such an excursion is no easy matter, for few are the vessels which have occasion to proceed so far out of the busy paths of traffic. However, it happened that a small vessel was leaving Honolulu for the South, intending to call at several islands seldom otherwise visited, and, it matters not how, I went in her. We set sail accordingly early in October.

Concerning our life on board little need be said. We experienced the usual "ups and downs" (pretty literally at times) of ship life, but as a rule the days spent at sea were monotonous and uneventful, and therefore unworthy of particular narration. My companions on board were few in number, but pleasant, and we passed the barren days agreeably enough together. It was, nevertheless, a distinct relief to our monotony to hear the cry of "Land ahead!" and to see the tree-tops of our first island come into view above the horizon. This was Washington Island, about three hundred miles north of the Equator, in long. 160° W.

An hour or two later we were lying a few hundred yards off the surf that beat in noisy white breakers on the coral beach. The island appeared nearly circular, shaped like a cheese-cake, with a base of white coral and a smooth top of thickly-growing cocoanut trees of uniform height. A few huts were to be seen amid these trees above the beach, and the red ensign of England floating above them showed in whose possession the island was. It is, in fact, owned by a Honolulu firm of Englishmen, who cultivate cocoanuts for the production of "copra." Landing here is unpleasant, owing to the surf, and as our stay was to be short I did not attempt it. The sole white inhabitant came on board, not sorry, probably, to hear himself speak in his mother tongue for a change. He had here about forty natives, not of this island (itself uninhabited when discovered in 1798), but of adjacent islands, imported by the firm he represented to work on the cocoanuts. Our captain's business was soon transacted; the hermit of the island departed to his realm, and we weighed anchor once more.

Sixty-five miles south-east of Washington lies Fanning Island, our next destination. Owing to baffling currents (in these parts strong and changeable), it took us three days to cover that not very great distance. It was evening when we arrived

[1] We are indebted for these papers to an officer in her Majesty's Navy.

off the anchorage, to enter which it was necessary to wait for the tide to slacken. While so waiting we were able to inspect the island from seaward. It is an "atoll," or ring-shaped reef of coral, enclosing a lagoon about nine miles in diameter. The island itself, which is thus some thirty miles in circumference, is not more than three or four hundred yards in breadth (on an average, for it is irregularly bounded), and is grown with cocoanut-trees, as well as indigenous plants, all round its entire length.

As we lay outside the break in the circular sweep of trees marking the entrance into the lagoon, we were struck with the beauty and variety of tint of the smooth water inside. Streaks of lightest blue, of green, and of yellow marked shallows of sand or coral; and these colours, bright in the setting sun, glittered through a framework formed by the dark-green trees in the foreground at the entrance, and contrasted with the dark blue of the water surrounding us outside.

Through the narrow entrance the tide rushed with great velocity. A little before dusk it slackened, and we glided into the lagoon piloted by one of the inhabitants who had come out to us in a small boat. We anchored just inside the entrance, off the little village containing the whole population of the island. Its huts were scattered about a grass plot under the cocoanut-trees, close to the point we had passed on our right-hand side in entering. A beach of dazzling white sand was quietly lapped by the clear water of the lagoon, and from it two small wooden piers ran out. Under the trees, upon the grass above the beach, were gathered a number of natives, their bright dresses putting the finishing touch to a pretty scene.

The brief twilight was soon over, and a night of profound peace followed. The picture from on deck early next morning surpasses description, as the black outlines of the graceful palms against the starlit sky changed to bright green in the rising sun, and the smooth water of the lagoon assumed innumerable varieties of colour—green, blue, yellow, opal—in the changing light, glittering transparent over the coral wonders beneath.

Later in the day I landed at the little pier to explore the place. Grass covered only a small area—the site of the village, where it had been sown. In the centre rose a neat little house of two storeys, the residence of Mr. ——, who superintends the work of the island, which, like that of Washington (both islands being, in fact, owned by the same firm), consists in the preparation of "copra." For this work natives are imported from neighbouring islands at fixed monthly wages, returning to their own homes after a short period, to be replaced by fresh batches of emigrant islanders. The inhabitants, at this time, numbered about forty, including the wives and families of the men. Their huts, of wooden poles and cocoanut leaves, were scattered about the grass-plot round the central building already mentioned. One or two possessed gardens of bananas, but not many fruit-trees were to be seen. Outside the huts sat at their ease on the turf the temporary populace. Dark-brown in skin, their faces were not unpleasing; of Malay type, with broad noses, intelligent eyes, and straight black hair. The women were dressed in the usual gown of the Pacific islands, a long robe-like garment, descending freely from neck to heel, and made of cotton printed in various colours and designs; the men in nondescript semi-civilised garb. There was a variety in feature and aspect among them, indicating different degrees of refinement in a curiously marked manner, for they came from different outlying islands, some of which are more civilised than others.

For very moderate wages these men worked for about eight hours a day, and well, for their pay depended on the quantity of cocoanuts they brought in per diem. The preparation of "copra" is simple. The nuts are picked up after they have fallen to the ground, and are not plucked from the tree. The husk and shell are removed, and the meat taken out and cut into rather small pieces, which are then spread out upon the floor of a shed to dry. When dry they are entitled to the name of "copra," and are sent in that condition to London or America to be pressed into oil.

Among the huts was one of larger size, the upper half of whose walls was open. Looking in, it could be seen that it was a miniature church, with pulpit, reading-desk, and seats for about eighty. On inquiry I found that all the natives were Christians, converts chiefly of the London Missionary Society. One of their number officiated as reader, and conducted services in the little church. Sundays were strictly observed.

The wants of the community were supplied by a "general store," superintended by Mr. ——. Communication with the outer world was maintained by a small schooner, which carried away the copra and brought back provisions and clothes for the store. This schooner had been missing for some time, and provisions were failing, so our visit was opportune.

Walking beyond the village, with whose limits the soft grass ceased, I emerged upon rougher ground of dead, broken coral. Through it sprang abundant vegetation, but of only three or four varieties, the commonest of which was a large-leafed sprawling bush, bearing a minute white flower faintly scented. In portions where the tide from the lagoon encroached, forming sandy flats, a kind of mangrove with wide-spreading roots grew. Overhanging the clear water of the lagoon were umbrella-like trees with thin bare trunks and long narrow leaves, which I afterwards found to be pandanus. Cocoanuts, of course, predominate; these were still being planted wherever there was room for them.

Large land-crabs abounded, bright-coloured, but unpleasant-looking, flourishing one gigantic claw. They are a great pest to the natives, having a liking for cocoanuts, to obtain which they ascend the smooth and lofty tree-trunks and sever the stalk of the nut, which then falls to the ground. The crab descends and regales himself on the hard-earned luxury. This feat seems to

credit the crab with a sagacity one would doubt its possessing, but the natives assured me of its truth.

Land-rats are another nuisance to the cocoa-nut growers, sharing with the crab its liking for that pleasant fruit. Tin plates are nailed round the tree-trunks near the ground to baffle these acrobatic vermin.

Walking along the curving shore of the lagoon, one could not but wonder at the marvellous manner in which the solid island underfoot had risen. Outside, within a few yards, roared the huge breakers of the Pacific Ocean, dashing themselves in foam on the outer edge of the circular atoll. Inside, from the quiet white beach stretched the big, calm lagoon, flashing with various colours — a vast basin raised in mid-ocean. And this mighty work, strong and beautiful, is done by a ludicrous, jelly-like, minute creature, courteously but wrongly called an insect.

To enter into a description of the theories of coral-building would occupy too much space here. One thing seems certain: that the coral "insect" cannot live below a depth of about thirty fathoms. The coral island, it was argued, must therefore either be built on submerged mountain-tops, or, if Darwin's theory be still accepted, have formed like a fringe round the water-line of a natural island, which, in the course of time subsiding, would leave the lagoon island, or atoll, to fill its place. This explanation was supported by the various volcanic and other islands still existing with either a fringing coral reef closely adhering to their sides, or a barrier reef further out, showing the gradual subsidence of the parent island. But the later theory of Mr. Murray, of "The Challenger," assumes that the foundations are not necessarily solid rock, but may be deep-sea deposits.

After transacting our business we sailed from Fanning Island and shaped our course for Christmas Island, 145 miles distant, lying in lat. 2° N. and long. 157½° W. In a few days we sighted it, and were shortly anchored off a small outlying island named after Captain Cook, who first discovered the place, which he called Christmas Island, after the season in which he first visited it. The name is inappropriate, for the island is unprepossessing in appearance—a desolate, barren strip of sand, enclosing a lagoon. Here we again met the ubiquitous flag of England, which flew over a point near our anchorage, on which a small settlement stood consisting of two or three wooden houses surrounded by a few trees.

Here one Englishman lived, with four natives and their wives. Their occupation was diving for mother-of-pearl shell, the business being conducted by a New Zealand firm, which owns the island. These natives, like those already met with, were imported from other islands—in this case from Penrhyn.

A curious fish story is told of Christmas Island. It is said that in the lagoon numbers of dead fish are to be found, naturally preserved (by the salt of the water, presumably) and fit for eating! This idea of fish pickled alive seems too good to be true. We had not time to ascertain the fact for ourselves, however, for in an hour or two we weighed anchor once more and steered for Malden Island (lat. 4° S., long. 155° W.), where we arrived a few days later.

Malden Island, which is also under the British flag, presents the same uninviting appearance as Christmas Island; a barren, dry expanse of sand, five miles long by four broad, containing a shallow lagoon unconnected with the sea. Outside, the water, even close to the beach, was too deep for anchoring. But moorings were laid down by the Melbourne company which owns and works the island for guano, its sole production, and to one of these we made fast.

Some of us landed for a walk. An ingenious wooden pier of some size, projecting beyond the breakers, allowed us to get on shore conveniently. A tramway ran along it, terminating in a shoot for loading boats with the guano for shipment. The pier was strongly secured to chains whose outer ends were anchored. Its piles were not driven into the ground, but, in case of a heavy sea, rose and fell, avoiding strain. Behind the pier, above the beach, stood a row of plain wooden huts and sheds with roofs of galvanised iron. One contained a condensing apparatus, the sole water supply of the island.

The inhabitants consisted of four white men and about a hundred natives of other islands, imported for periods of a few months at a time. But to this island, unlike the others, they were not allowed to bring their wives and families. Here they worked their term, returning to their own wooded islands with sufficient earnings to buy their greatest desire—a galvanised iron roof. (They are sometimes paid in this commodity itself.)

The manager of the island very kindly accompanied us to the guano-fields, which were about four miles from the landing-place, and connected with it by the tramway already mentioned. We got into a truck, and, pushed by four natives, traversed the island-plain, which was unrelieved by a single tree. A low, sprawling, seaweed-like plant largely covered the sand, and huge lumps of coral lay here and there. The lagoon, covering only a small portion of the island, shimmered in the distance. In about an hour we arrived at the scene of action. Here we found about fifty natives, under a stalwart half-white overseer, with pick and shovel digging the guano out of its rough coral bed. This prosaic but valuable substance resembles dark-brown sand. Its quality, varying greatly in different portions of the field, was tested by hydrochloric acid dropped upon it. The less resulting effervescence the better quality. After being dug up it was sifted through wire screens and placed in bags, with which the trucks were loaded. The south-east trade-wind, blowing constantly across the island, was then utilised. Certain of the trucks were masted and rigged like a boat. Hoisting a big square sail, and taking half a dozen trucks in tow, they sailed across the island to the pier, where they were unloaded and their cargoes piled up ready for shipment. After seeing the work, we

hoisted the sail in our truck and sailed merrily back to our starting-point, considerably quicker than we had travelled up. It was a peculiar and interesting expedition.

Malden Island was at one time itself inhabited. Tradition says that it was well wooded, and that rains (now almost unknown) were frequent. But the trees disappeared, cut down by tempests or by the inhabitants, and rain ceased. The inhabitants, deprived of water, disappeared, and nothing more is known of them. Traces remain of their wells, their paths, and their graves.

## TRIFLES.

"'TIS but a trifle!" And the man passes on, kicking aside as he goes some precious opportunity which has been laid in his path by angels.

"'Tis but a trifle!"

But another picks it up and takes it into his life as a thing to be rejoiced over. And he is glad, for he knows that simple unconsidered items are of incalculable importance in the making of nations as well as of lives. Perchance a student, he will tell you of the preciousness of odd moments. And, laying figures before you, he will present a case of this kind. Suppose one boy, aged ten years, determines to rise at five o'clock all the year round. Another of the same age, indolent and fond of ease, rises at eight every morning. If they both live to be seventy years old the one will have gained over the other, during the intervening period of sixty years, 65,745 hours, equal to 2,739 days, or just seven and a half years. Or if, with his student days at an end, and now face to face with the world in everyday life, he is yet determined to preserve his existence sweet and bright by keeping up an acquaintance with what is best in art and literature, he will tell you that this is no impossibility, but far from it; that the proper place of both literature and art is side by side with the coarser plants of daily necessity, and that they "must depend for their culture not on the exclusive devotion of time and wealth, nor the quickening rays of titled patronage, but on hours and seasons snatched from the pursuit of worldly interests."[1] Then, again, a man of business, with his eye "on the main chance," has his excuse for every bit of energetic outburst or thoughtful economy on his part. He has heard that 2,500,000 clover-tubes have to be sucked by industrious bees to produce one single pound of honey; so every customer, however trivial his requirements, is carefully attended to, for he is determined that no clover-tube shall remain unsucked by him.

That there is a contemptible way of looking at small things one is bound to confess. "The temper that leads to put great weight upon trifles, and consequently to raise great trouble and vexation out of nothing, is the chief ingredient of that bitter mixture which makes life unhappy."[2] A too searching carefulness makes a man fidgety and suspicious, and is apt to dwarf his nature and cripple his soul. Pursued to morbidness, it takes the manliness out of him, keeps his inner life away from the light, destroys the emotions which prompt to good deeds—in short, makes him a miserable failure for angels to pity and God to be sorry over. But when, on the other hand, trifles are turned into rungs of the ladder along which a man ascends to holy heights of supreme achievement, then are all things well. For by means of a ladder it is possible to either descend into dark depths or to ascend to where pure air and sunshine are. The ladder is ours, and it is also ours to use it for upward or downward purposes.

We often prate long and loudly of the spirit of the age, and of the swift-footed progression hurrying along on all sides of us; but do we always recognise the importance of the influence of the home in any culture or advancement worthy a name? An Englishman's house is not merely his castle; it is the spot whence emanates the power which rules kingdoms and emperors. And yet it is but a nest of trifles! Here the boy or girl grows up, and—though we fully acknowledge that his or her future depends greatly on mental and bodily qualities possessed at birth—here, by the small occurrences and influences of daily life, are shaped the original gifts. Given, for instance, a boy with musical genius: are not the early home surroundings answerable to an untold degree for the paths he will afterwards tread in his professional career? The lad has a gift to unlock the hearts of mankind, to make princes weep or mobs forget their malice and laugh. Is he to prostitute his God-given powers, or is he to look upon them reverently and treat them as talents to be hereafter required of him? For partial answer, watch keenly the ways and words of his parents; the gift of prophecy in the case is wonderfully simplified if based upon observations in this direction. Many a girl's future, and many a boy's, has been sweetened and made worthy and kept pure through recollections of what of good intent and purpose lay about their early footsteps. The memory of the music of a mother's voice, or the vision of some fair flower which long ago lived in the sunshine outside the bedroom window, has, before now, lifted men and women out of degrading depths, and caused them to sit in purity and peace. Hence the necessity for high and holy purpose in the small things which go to make up the sum-total of home-life, and for the strictest care in keeping the youthful

[1] Washington Irving.
[2] Lord Kames: "Art of Thinking."

minds over which we have influence in a healthy atmosphere.

> "Murmur soft music to their dreams,
> That pure and unpolluted run,
> Like to the new-born crystal streams
> Under the bright enamoured sun."

What trifles, too, suffice to cause the heart of a man to cling lovingly round his own hearth-stone! Coming from the rush and struggle in which he finds his daily bread, he crosses the threshold of his door, and straightway the world is shut out, and all by means of the handful of books he loves, the few pictures on the walls, the grasses and flowers about him, but chiefly through the sweet smile of love which welcomes him. Incomplete as his existence might seem whilst treading the dusty ways of business life, his home makes him at once realise that

> "The world were not so bitter,
> But a smile could make it sweet."[1]

Husband and wife should alike remember daily how much their mutual happiness and good depend on turning towards each other the bright side of every experience. "Little joys refresh us constantly like house-bread, and never bring disgust; and great ones, like sugar-bread, briefly, and then bring it. Trifles we should let not plague us only, but also gratify us; we should seize not their poison-bags only, but their honey-bags also; and if flies often buzz about our room, we should, like Domitian (?), amuse ourselves with them, or, like a certain Elector, feed them."[2] But where small things prove to be both worthless and disagreeable, there must be united effort to banish them, for "nine gadflies will beat the strongest horse, four Caffre bulls an African lion, and, by the common tale, one troop of mice an archbishop."[3]

We must also by no means forget the trifling amenities of social life. "On the occasion of Solomon's marriage, all the beasts, laden with presents, appeared before his throne. Behind them came the ant, with a blade of grass: Solomon did not despise the gift of the ant."[4] Who can possibly foresee the effects which might follow a pleasant word or kindly act, however small?

> "I shot an arrow into the air—
> It fell to earth, I knew not where;
> For, so swiftly it flew, the sight
> Could not follow it in its flight.
>
> I breathed a song into the air—
> It fell to earth, I knew not where;
> For who has sight so keen and strong
> That it can follow the flight of song?
>
> Long, long afterward, in an oak,
> I found the arrow still unbroke;
> And the song, from beginning to end,
> I found again in the heart of a friend."[1]

A great Frenchman once confessed that indolence, negligence, and delay in little duties to be fulfilled had been far more prejudicial to him than great vices.

Events which have revolutionised the world have had their birth in trifles, apparently weak and worthless, and seemingly at first without meaning or influence. But the rill has grown into a stream, and in turn the stream has made majestic sweep into the boundless ocean. The Hindoos have a saying that the earth rests on the back of an elephant, and the elephant on a tortoise; and Pascal, seeing the intimate connection between little things and great, wrote in his "Pensées," "If the nose of Cleopatra had been a little shorter, it would have changed the history of the world." Even history itself is to many but a vast setting for the portraits of some few heroes, men of lowly birth often, but of iron will, stout and earnest. Very simple occurrences sometimes furnish the bias which turns the footsteps of individuals in the direction of so-called greatness—a child's lisping tale, a thought born in the darkness of the night, an anxious mother's warning, a father's spoken ambition for his son's future, or perchance the falling of a tree or the burning of a house. Every boy knows of Newton and the apple, of Watts and the kettle, and of scores of other illustrations of that of which we write; and what school lad is there who cannot tell of what the theft of Helen of Troy did for the olden world? Instances abound in which a great career has hung upon an apparent accident. "Lord Eldon was within an ace of retiring from the bar upon a curacy, and the Duke of Wellington of leaving the army for a commissionership of customs. It rests upon respectable, if not quite unimpeachable, authority that Cromwell, Hampden, and Arthur Hazlerigg were on the point of weighing anchor to join the Pilgrim Fathers when a royal embargo was laid upon the ship. In the summer of 1829 Thiers was certainly on the point of accompanying Captain Laplace on his voyage of circumnavigation round the world, although the precise motive and intention are left in doubt. All the biographers are agreed that what decided him to stay was the formation of the Polignac Ministry, August 5th, 1829."[2]

We know of no more interesting branch of reading than that which traces the growth of ideas and the development of events. 'Tis invariably a repetition of the parable of the mustard seed—small beginnings, great results. Plutarch tells us that Romulus, to try his strength, threw a spear from Mount Aventine to the Palatine Hill, the head of which struck so deep into the ground that none could pull it out, and so it grew and shot forth branches, and became an exceeding

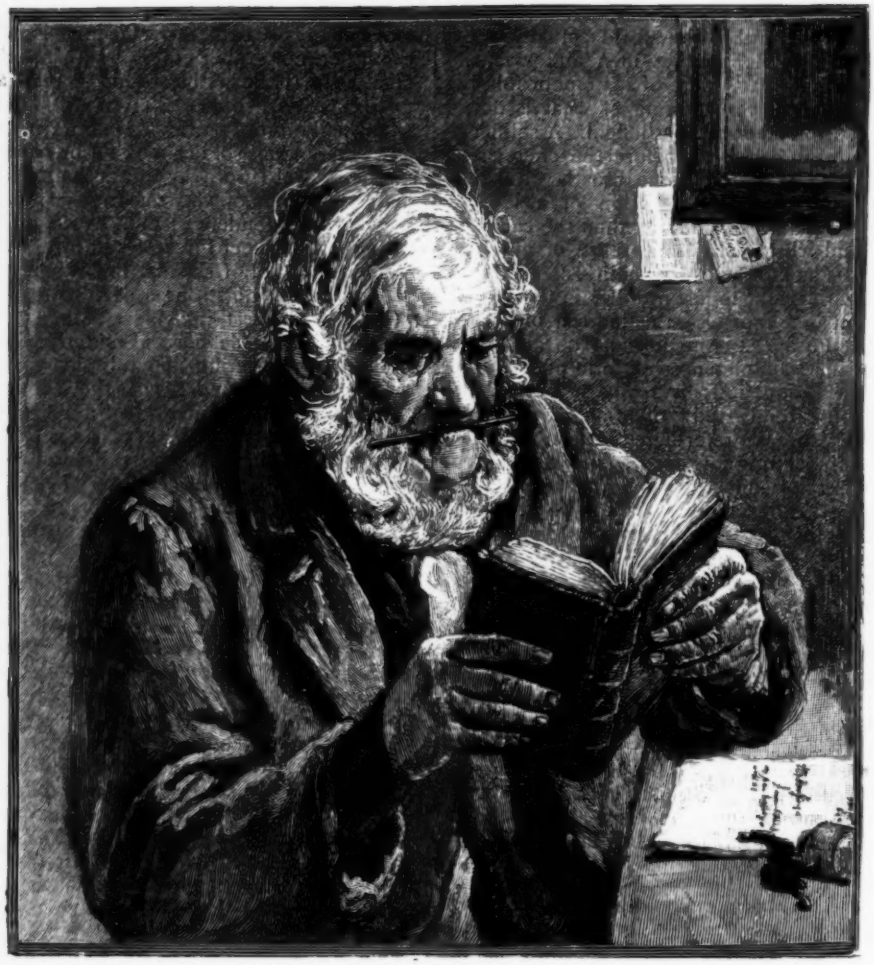
2 Hayward: "Sketches of Eminent Statesmen," etc.

great tree, which was preserved piously by posterity.

Innumerable cases occur in daily life which unmistakably show that the world actually does know nothing of its greatest men and women. The heroism and martyrdom of some poor folk in cottages shame the very naming of what is done in the heat of blood on the battlefield. A soldier's deeds in a wild half hour before the enemy are not to be named in the same breath with the patient self-sacrifice and devotion of a life to others' good, that occurs oftener than the careless imagine, and which, alas! the rattle of military drums makes us look upon as trifling.

In literature the taste just now lies in the direction of lightsome morsels—thistledown blown to us through the ages. And it must be admitted that the artistic completeness of form of some of our modern productions is really suggestive of centuries of careful study of what pertains to grace and finish. We refer here more particularly to the dainty setting of our recent verse—the matter we are not concerning ourselves about just now. Even this development of artistic taste has its basis in things small and commonplace. "We should know," says Goethe, "the weary steps of mere handicraft and mechanism, over which the man of talents has struggled in the course of centuries, before we can conceive how it is possible for the man of genius to move with airy freedom on the pinnacle whose very aspect makes us giddy."

The essentially hurried condition of modern life makes its demand for these small things in letters; and where a demand shows itself, there also rapidly will the supply be found. Now and then a scholar will lift up his voice and cry aloud against this frittering of moments in small literature of decidedly small worth. But if we view the matter in other than a narrow way, this trifling with trifles is not really so absurd as it is made to appear. A business man—to use an everyday example—coming home tired from his office in the evening does not usually feel equal to Homer or Virgil—or Milton, for all that—when his feet have got comfortably into his slippers for a couple of hours before bedtime. He much prefers something in paper covers of neat and handy size, of a couple of hundred pages, and with not too much on a page. And, in spite of Mr. Frederic Harrison, we would gladly give it him; but at the same time we are bound to confess that what is worth reading of this kind is limited. A story-teller possessed of the prime elements of earnestness and purity, with added gifts of humour and pathos, and an unmistakable appreciation of dramatic situation, with ample power to use it all skilfully, and in a short and closely-packed manner—such a man, in the present condition of affairs, has the English-speaking world for an audience if he desires it.



Note also in this connection the absorbing interest shown in the daily affairs of a famous man. The veriest nonsense is scattered broadcast and finds ready readers on the one hand, and, on the other, newspaper editors waiting with scissors and paste to keep the gossip going—and such gossip as it is, forsooth! With gravity sufficient to make the brute part of creation grin they relate what the famous soldier took for breakfast, or what garments were worn by the author who has just issued a volume of very queer verse of extremely questionable tendency; and so on till the thing kills itself by sheer force of its own absurdity.

The very soul of scandal and venomous small-talk (to give it no stronger designation) lies in an unhealthy interest in trifles. Many a poor old cottager has made her days utterly miserable by continually bothering about "what he said," and "what she did," and "what they thought"; and yet is not this strained and forcible interest the life-spirit of such a book as Boswell's "Life of Johnson"? Does gossip really grow pardonable when it is translated into print and becomes stale?

It is impossible to get away from the all-powerful grip of small things. Read a volume by some acknowledged writer, for instance, and what do you retain of it all? You will find that what is definitely left with you is a smart aphorism or two, or a pointed story. The influence of the book as a whole might live with you and colour your life; but when memory stretches out to lay forcible grasp on what it can, there is usually very little to be immediately secured. Does anything of Sir Philip Sidney's stick to a reader like his confession that the accents of the old ballad of "Chevy Chase" always sounded in his ears like a trumpet-call? To another the reading of Lockhart's "Life of Sir Walter Scott" is valuable chiefly for the graphic picture it contains of the great novelist's end: "It was a beautiful day—so warm that every window was wide open—and so perfectly still that the sound, of all others most delicious to his ear, the gentle ripple of the Tweed over its pebbles, was distinctly audible as we knelt around the bed, and his eldest son kissed and closed his eyes." The fact that Gibbon, whilst he sat and mused amidst the ruins of ancient Rome, there first conceived the idea of writing his "Decline and Fall," is generally more familiar to the majority of readers than any single chapter of his "splendid bridge from the old world to the new."

It were easy to dilate on the importance of trifles in Art, Literature and Science, in Religion and in Society—in short, in all that pertains to life; but enough has been said to show how profitable and interesting the subject might be to one who cares to follow it for his own individual delectation.

J. ROGERS REES.

## ETYMOLOGICAL DOUBLETS.

THERE are points in which the natural history of language bears a striking analogy to that of plants. If a highly cultivated rose, for instance, with exquisite hue and scent, or a delicately flavoured pippin, the product of long years of careful skill, be allowed to grow at its own wild will, with no cultivating hand to preserve and foster the specially developed excellence, soon and surely its characteristic virtue departs, and it falls back in type towards its origin in the common dog-rose of the hedges, or the sour crab of country lanes. So if a highly inflected and cultured language is cut adrift from literary associations, and is made the vehicle of speech among an uncouth semi-barbarous race, its inflections are soon lost or largely modified, and the words of its sonorous and dignified vocabulary are ruthlessly compressed and cut short to suit the convenience of the vulgar tongue.

Especially was this the case with Latin, when, in the decadence of the Roman power, it remained as the general medium of communication among the soldier-colonists of the provinces and the tribes whom they had conquered—when in Gaul, for example, the fusion of these elements of population, hastened by their common subjugation to invading bands of hardy German warriors, produced the Frankish or French nation, and their rough use of the polished language of Rome broke it down into the curter, sharper speech of Old French. It was then that the changes took place by which *primum-tempus* was transformed into *printemps*, *bonum-augurium* into *bonheur*, *sabbati-diem* into *samedi*, *quisque-unus* into *chacun*, *quinquaginta* into *cinquante*—and so on.

This breaking down of Latin into Old French, purely popular and unscientific as was the process, and rudely unconscious on the part of those who effected it, was yet marked by certain well-defined characteristics; the mere instinctive desire for ease

of utterance, acting freely and as it were at random, fell into grooves as constant and unvaried as if they were the result of preconcerted rule; so that philologists can say, with near approach to precision, what form any given Latin word, if it survives into Old French, is sure to take. Three main principles underlie the process: the syllable accented in Latin is always preserved in French; a short vowel before the accented syllable is elided; and a medial consonant (*i.e.*, a consonant standing between two vowels) usually disappears; there are also various minor consonant-changes and vowel-modifications which it would be beyond our present purpose to specify. These main rules we shall come back to by-and-by.

Several centuries later, when this transformation had been fully wrought out, the Norman Conquest of our island, and the flooding of our language and literature with Norman-French phraseology, brought into our vocabulary many of these relics of hacked and shrivelled Latin; our tongue became enriched with words which, borrowed from French, were of Latin origin; our Saxon speech received its great infusion of Romance. But at the same time Latin, in its original purity, was known and studied by the clergy, and when they were at a loss how to express in English some abstract idea or ecclesiastical notion, they took the corresponding word from Latin, altered it slightly to adapt it to English form, and incorporated it in our language. Wyclif, in translating the Bible, frequently took this liberty; and still later, during the revival of classical learning in the sixteenth and seventeenth centuries, the practice was greatly extended.

Now it so happened that in many cases the Latin word thus taken directly into English was one which had already, having been melted in the crucible of popular talk into an Old French form, come into English long before: so that from the one fountain-head twin rivulets of speech passed to the same destination by two different channels, one short and direct, the other long and circuitous; and often, moreover, the lengthy and roundabout passage had not only changed the form of the word, but had also modified its meaning.

Hence it comes about that we have in English many instances of what are called etymological doublets, words traceable to one and the same source, which are more or less different in form, and more or less different in meaning as well, with a variation indeed that at times is startling and even ludicrous.

Thus Latin had the adjectives *fragilem, legalem, quietum, regalem, rotundum, securum;* by loss of medial consonant in Old French they reached us in the forms *frail, loyal, coy, royal, round, sure;* direct from Latin we have *fragile, legal, quiet, regal, rotund, secure.* With the exception of the pairs *regal* and *royal, rotund* and *round*, which are practically synonymous, the corresponding adjectives differ considerably in meaning, those of the latter set (direct from Latin) being always more literal: *Fragile* is applied to glass and china, and to human beings when they seem equally flimsy and destructible, but for virtue and moral fibre of the same quality *frail* is the only word. *Legal* denotes anything that has to do with law, but *loyal* refers only to those who reverence law, especially as centred in the person of a sovereign. *Quiet* is widely used of the absence of noise and bluster, but *coy* has a far more limited application, and describes a unique attitude of maidenly reserve, of "No" on the lips with a "Yes" at heart, that is more easily recognized than defined. *Secure* is "free from care," with no physical anxiety or fear of danger, whilst *sure* carries us into a higher region, and sets us free from moral and mental anxiety, from all the torment and trouble of doubt.

Another adjective, not so much abbreviated because the Latin has a double instead of a single medial consonant, is *poignant*, the French equivalent of Latin *pungentem*, "pricking, stabbing," whence by direct transference the English *pungent*. The words are the same in origin, but they are not mutually replaceable; we cannot speak of "pungent grief," nor of the "poignant smell of pepper."

Amongst the nouns thus duplicated in English use, those from Latin nouns ending in *-tionem* are the most numerous; in these the accented syllable was the *-on-*, which is therefore always preserved. Latin *redemptionem* is a good example, in which the medial consonant *d* first falls out, leaving *re-emptionem;* and then by successive phonetic changes, the first *e* becomes *a*, the *p* is dropped, *mt* becomes *nç*, and the Old French word appears as *raençon*, further modified on its passing to English into *ransom*—the precise equivalent of *redemption*, for equally by ransom and by redemption the prisoner is "bought back" to liberty.

The equivalence in meaning of the two derivatives is rarely so exact as this, however. From Latin *potionem* our directly-adapted word is *potion*, a draught or drink, but the French word is significantly restricted to a deadly draught, a *poison*. *Tradition* is the handing on of knowledge from age to age, whilst *treason* is the handing over of rights and privileges into the power of an enemy. A *ration* is a strictly calculated amount of food, and *reason* is the whole ability of the mind to calculate, think, and judge—in which instance, by exception, the French word keeps closer to the literal meaning of the Latin *rationem*. *Prehension* is the act of seizing or capturing, whilst *prison* (regularly reduced from *prehensionem* to *prensionem, presionem, preison, prison*) is now the place where the captured person is confined. Other examples of noun doublets are *balsam* and *balm* from Latin *balsamum*, *crypt* and *grotto* from *crypta, gaud* and *joy* from *gaudium, vote* and *vow* from *votum*, together with the three following that may be examined more fully.

An *antiphon* is a responsive hymn, in which two choirs answer one another in song:—

> "In blissful antiphons ye thus rejoice,
> To render to the Lord with thankful voice,
> An endless Alleluia!"

Etymologically *anthem* is the same word; the Latin *anti"phona*, with accent on the *i*, retained this syllable in Old French, while the medial consonant *ph* gradually disappeared; the Old French

forms were *antievne*, *antienne*, and the English development was *antefne*, *antemne*, *antem*, *anthem*. The original sense of *anthem* long survived, Cockeram, in 1623, defining it as "a Song which Churchmen sing by course one after another"; but now all idea of responsive singing is lost in *anthem*, and has to be expressed by the modern adaptation *antiphon*.

*Cadence* and *chance* seem widely sundered in meaning, and yet they have their one source in the Latin *cadentia*, "falling"; *cadence* indicates the interval or fall from one note to another in music, or the dropping of the voice in speech; *chance* is a "falling" too, the falling-out or happening of events.

But who would suspect that *hospital* and *hotel*, one the sad refuge of poverty-stricken disease, the other the lounge of luxury, could have anything in common? Nevertheless the Latin *hospitale* fathers them both, and declares them both to be "guest-houses," from *hospes*, "guest"; this word, modified into French *hôtel* by omission of the medial *p* and short vowel *i*, and by the absorption of *s* into the circumflexed *ô*, has come to mean in English a house of entertainment for well-to-do travellers, a large and stylish inn; whilst a *hospital* receives guests of quite another stamp.

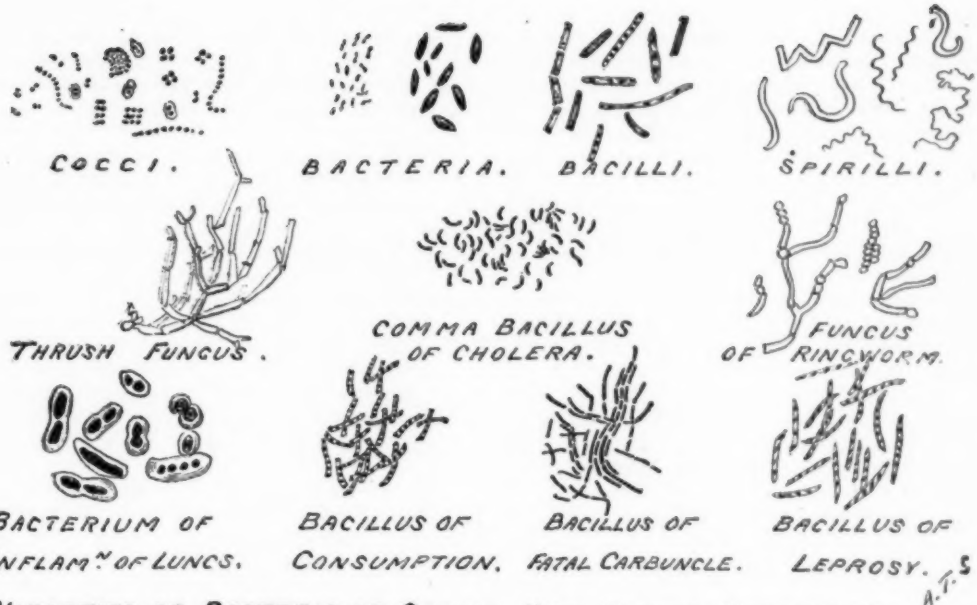
Passing on to doublets among the verbs, we may notice that *compute* and *count*, almost identical in meaning, both come from Latin *computare*, *probe* and *prove* from *probare*. Nor will those who have followed the alterations of form already traced out be surprised to hear that *blame* is the same word as *blaspheme*; *blame* preserves the original meaning "speak ill of" (Greek βλασφημέ-ειν) weakened in force to "find fault with, condemn"; *blaspheme* has been introduced direct from Latin for the sake of the special theological sense it supplies. Then, too, *direct* and *dress* have the same origin; and since *direct* has for its root-idea *rectus*, "straight" or "right," the maid-servant who paraphrases her *dressing* as "setting herself straight" or "putting herself to rights," is unconsciously substituting an equivalent that is etymologically fitting.

One curious effect of the pronunciation of mediæval Latin, giving rise to several interesting doublets, remains to be noticed. In the Latin of that period the letter *i* was often sounded as a *j* or soft *g*; so that from a semi-vowel it became a thorough consonant, and then, in the subsequent development of Old French, leaning against the consonant preceding it, gradually pushed the latter out of existence; thus Latin *hordeum*, "barley," became successively *hordium*, *hordjum*, *hordje*, *horje*, *orge*. In like manner Latin *cavea* became *cavia*, *cavje*, *cage*, whence we have as doublets *cave* and *cage*, both originally meaning "a hollow place," though their present use refers to hollow places very different in character. So *rabies*, "madness," recently introduced as a scientific term, more especially in connexion with the canine malady that makes muzzling an unfortunate necessity, has an equivalent of more general application in its co-derivative *rage*.

And, lastly, *calumny* is a direct transference to sixteenth-century English of Latin *calumnia*, whilst through Old French we had the same word long before in other guise. *Calumnia* there developed into *calumnje*, *calunje*, *calunge*, and with varying vowel in the second syllable *calonge*, *calange*, *calenge*; in central French the initial *c* became softened into *ch* (a modification of which we have already had an example in *chance*), and hence came our English *challenge*, found as far back as the thirteenth century. An early instance of its use, from the Northumbrian poem "Cursor Mundi," says that "The bestis lauerd sal ga quite Of alkines chalange and wite," which means that "the animal's owner shall go free of all kind of accusation and blame"; and Wyclif's translation of Jeremiah vii. 6 speaks of "fals chaleng to a fadirless child." Latin *calumnia*, the original of both words, meant "misrepresentation, false accusation"; *challenge* has risen in the social scale, and is now an honourable proffer of a trial of strength or skill; *calumny* has, if possible, gone down still lower, and is associated in sense with the basest and vilest of false charges.

If we come to an end here, it is not that the stock of doublets is exhausted, but because enough have been placed before our readers to illustrate amply this curious and interesting feature of our language.

ALFRED ERLEBACH.



## The Ivy Flower.

O, IVY-FLOWER, white ivy-flower,
You're small and very shy;
You're hardly seen in your bower of green,
And many pass you by;
But the grey moth knows where your clusters hide,
And comes to you at eventide.

O, ivy-flower, white ivy-flower,
It's late before you bloom,
When the trees are dead, and the birds have fled,
And the rain and the mist have come;
But your honey-cup, as the grey-moth knows,
Is as sweet as the nectar of the rose.

C. J. LEE.

# ABOUT GERMS.

VARIETIES OF BACTERIA OR GERMS VERY HIGHLY MAGNIFIED.

WE propose in a few words to state what is at present known of this obscure yet fascinating subject, and in doing so to avoid exaggeration on either side.

First of all, as to the existence of these Germs. In numbers they are formidable. Every pound of surface soil, speaking generally, and in good bold round numbers, is said to contain the matter of some five hundred million of them, more or less. Every article of food, clothing, furniture, the walls, ceilings, floors, streets, houses—everything, in short, is thickly covered with them, including this very paper on which their secrets are now partially revealed. The air, indeed, is not so crowded, town air—real town air—averaging, the West with the East end, about five thousand per cubic yard, while real country air only contains about one hundred—a slight difference! The reader will be relieved to hear that there are, however, depths and heights to which they do not penetrate. They are not found at the depth of one yard in the solid earth, nor at a height of one hundred thousand feet.

Now, what are these beings? Are they mere ideas, or are they animal, vegetable, or mineral? A common notion is that they are animals of some sort, the reality being that these and all other germs are vegetables, and not animals at all. They are also very lowly and humble vegetables; principally varieties of fungi, and consisting of the plant itself and the seeds or spores, of which some varieties are here portrayed.

They certainly do act occasionally in a curious and somewhat animal-like way, as we shall proceed to show.

Some of them never move at all, while others are always moving about, some with a smoothly gliding, others again with a tremulous, motion. These more active ones (still vegetables) are seen to avoid obstacles, and to free themselves from objects with which they may come in contact.

The means by which they thus progress are not easily discerned, as they themselves are rather small, twenty thousand being required to reach an inch, but are believed to be by a lashing movement, produced by a small whip at either end.

These germs are not only numerous, but they are capable of increasing rapidly, being said to multiply at the rate of a million an hour.

In the Royal Institution, on October 23rd, 1875, thirty small test-tubes, containing clear water, in which hay had been steeped, were exposed to the air. On the 26th they looked mouldy, on the 27th cloudy, and on the 29th muddy, and it was computed that a million germs a day had fallen into each of these thirty tubes.

There are many varieties of these germs. Of the dots, or Cocci, there are eighty known and named varieties. Of the oval bodies, or Bacteria, there are fifty varieties. Of the rods, or Bacilli, there are forty varieties. Of the spirals and irregular shapes there are thirty varieties.

The history of these beings is interesting. Their discovery gave us the secret of all decomposition, and at the same time told strongly against spontaneous generation. This quality of matter had been always asserted, and seemed incapable of refutation.

The labours of Pasteur tended in the same direction. He placed the most easily decomposed

fluids—strong beef-tea, etc.—in tubes with very long, narrow necks, well boiled the fluid, and then, keeping the neck red-hot by a spirit-lamp, allowed the germ-laden air to have free access; when, all the germs being burnt up as they passed through, the liquid remained sweet. He did more: he drew out the long neck still further and bent it round and round like a corkscrew; then kept decomposable fluids for months in the tubes, freely exposed to the common air. The germs could not traverse all the curves of the neck, and were deposited *en route*, leaving nothing but pure air to pass on. He then at the end of months broke the neck off short, and in twenty-four hours the beef-tea swarmed with life. In another he merely tilted the fluid up to reach some of the dust in the curves of the neck, and it soon decomposed. By these simple yet brilliant experiments he showed that all microscopic life and decomposition were due to germs.

In 1850 the germ of splenic fever was discovered, and the researches of Pasteur and others on yeast, on the silkworm disease, and infectious diseases in cattle, made the study popular; while Koch only a few years ago showed how easily in certain fluids these germs could be cultivated at will in glass tubes, and their whole life-history studied. Pasteur has gone further, for he has shown how the wildest of these germs (if germs they be), that of hydrophobia, can not only be tamed and rendered harmless, but how they can in their turn be made, like a tame elephant, to capture and subdue their untamed fellows.

Professor Tyndall's celebrated discovery—that liquids, otherwise soon turbid and filled with animal life, if every germ were killed by boiling, and all germ-laden air excluded by cotton-wool plugs, or the liquids taken to a pure Alpine air, where no germs are found at high altitudes, would keep clear, and consequently free from life an indefinite time,—this discovery has long since passed into history.

Such, then, is a brief account of the innumerable beings which we can neither see, hear, taste, nor smell, but whose labours are so gigantic that they slay hundreds of thousands of our race every year, and, having killed them, proceed to devour not only them, but every dead or dying thing, animal or vegetable, on the face of the whole world.

For it is true that but for their presence thousands would be alive who are now dead, but it is also true that but for their presence we could not live at all. Consider what would happen if every dead thing were preserved for ever. Imagine our England alone. Besides mountains of dead vegetable matter, the earth would be covered with the imperishable carcases of antediluvian monsters, only concealed from view by innumerable bodies of later animals, to say nothing of the layers of dead Britons, Romans, Saxons, and Danes, with an upper crust of Normans, all, however, covered by myriads of English of late years.

The imagination indeed refuses to picture what this earth's surface would resemble were it not for these destructive and devouring agents aiding the decomposing powers of chemistry.

It is now found that the moment that mysterious antiseptic called "life" is out of the body, or out of any part of it, legions of germs, like an army of navvies, set to work on every part and fairly carry it away, getting, however, none the larger by so doing, but dissipating the solid flesh into its component gases. They are thus universal scavengers, and have never yet received the due thanks of mankind at large for their indefatigable labours.

On the towers of silence of the Parsees in India, bodies exposed are picked clean in twenty-four hours by vultures, and in the same way, though unseen, our microscopic vultures will leave, in only a short time longer, nothing but a bleached skeleton, which in its turn will eventually fall a prey to their insatiable appetites.

Interesting observations have been made on the tails of tadpoles, the gradual disappearance of which during the transformation of their owners into frogs is now found to be due to exceptionally ferocious and voracious germs termed "phagocytes," who devour them piecemeal.

Germs may, indeed, be divided into two great classes: those which feed only on dead or dying tissues, and are unable or unwilling to attack others; and those which attack living bodies, and cause in most, if not all, specific diseases in both vegetables and animals.

This view is, however, still stoutly combated. On its first inception a doughty champion stepped into the lists to do battle with these daring foes,—with his carbolic sprays to kill them in the air,„his carbolic sponges to kill them in the skin, his carbolic water and oil to kill them on the very instruments used, and his carbolic dressings to prevent their subsequent formation in the wound, to say nothing of his well-carbolised wards, surgeons and nurses. These mystic rites are still solemnly performed by legions of his followers, and have doubtless caused the greatest consternation among the germ hosts. Mortality has been largely decreased, and decomposition arrested, and the foe everywhere vanquished.

But, as usual, the pendulum has swung, and now we find surgeons, not, we trust, in league with these hidden powers of darkness, and certainly not less skilful and renowned, not destroying, but defying, and even ridiculing these unseen powers. This last-named school use no spray, or water, or oil, but boldly undertake the most tremendous operations with undisinfected knives and hands; and oh! horror of horrors! not only wash out tremendous wounds with warm water from the tap, in which something like thirty-seven species of germs are known to flourish, while they boldly declare that if they could only get enough of them they would make their packings and dressings of germs, so harmless do they hold them. Such temerity is awful. Men like these would dare anything, laugh at the cannon's roar, and smile at a thunderbolt: and yet, it seems, they are apparently justified by results.

In Lucerne, I remember being told by the intelligent surgeon in charge of the Cantonal Hospital, where many severe operations are done,

what good results he had from disinfectants, from corrosive sublimate, and other lotions and dressings; but how, when at last he used undisinfected plain warm water, he had just as good.

All this is doubtless somewhat distracting, but all seem to agree that the more cleanliness in every detail the better are the results; and the general caution the discovery of germs has inspired has certainly greatly reduced the mortality in all surgical operations. A few more particulars about these germs may be of interest.

They are said to multiply in two ways; by fissure or breaking-off, and by spores or egg-like bodies.

These latter have wonderful vital power. Those found, for instance, in consumption remain alive for months after being dried, and if moistened and inoculated will then produce the disease. Some germs, again, must have air to breathe; others, again, can do entirely without it. Some can live on vegetable food; others, again, must be supplied with animal or nitrogenous food.

Most can resist cold better than heat, which is very fatal, except to these hardy young spores.

Boiling for half an hour kills all germs of any sort, and real drying and freezing kills all but spores.

All germs require water. The difference between germs as living poison, and mere chemical poison, is that the latter is destroyed and rendered harmless by dilution, whereas the former is not.

The germs are supposed to destroy life by their power of manufacturing a certain poison.

There are no germs in clean, healthy people, but wherever there is death, as in decaying teeth, or dirt, or disease, there they swarm.

One attack from them, if recovered from, as a rule protects from future attacks, seemingly by exhausting the particular soil in the body on which the particular species can live.

Exposure to the air greatly decreases the virulence of the more deadly germs. That which, for instance, produces fatal carbuncle was found to be harmless when exposed to the air for eight days.

Inoculation with these enfeebled germs protects against the fresh ones of the same species.

At Melun, in 1881, before an enormous and incredulous mob of professors, officials, and farmers, Pasteur demonstrated this fact. The occasion was so interesting, and marked such an epoch in germ-history, that, as it may be new to many of our readers, we make no excuse for presenting the scene, graphically told by his son-in-law, and translated into English by Lady Claud Hamilton. He writes:—

"It was on February 28th, 1881, that Pasteur communicated to the Academy of Sciences, in his own name, and in those of his two fellow-workers, the exposition of the great discovery (*i.e.*, of the possibility of vaccinating with germs weakened by exposure to the air, and thus protecting against the real disease).

"Hardly had the journals published the *compte-rendu* of this communication when the President of the Society of Agriculture in Melun, M. le Baron de la Rochette, came, in the name of the Society, to invite Pasteur to make a public experiment of splenic fever vaccination.

"Pasteur accepted. On April 28th a sort of convention was entered into between himself and the Society. The Society agreed to place at the disposal of Pasteur and his two young assistants sixty sheep. Ten of these sheep were not to receive any treatment; twenty-five were to be subjected to two vaccinal inoculations at intervals of from twelve to fifteen days, by two vaccines of unequal strength. Some days later these twenty-five sheep, as well as the twenty-five remaining ones, were to be inoculated with the virus of virulent splenic fever. A similar experiment was to be made upon ten cows. Six were to be vaccinated, four not vaccinated; and the cows were afterwards, on the same day as the fifty sheep, to receive inoculation from a very virulent virus.

"Pasteur affirmed that the twenty-five sheep which had not been vaccinated would perish, while the twenty-five vaccinated ones would resist the very virulent virus; and that the six vaccinated cows would not take the disease, while the four which had not been vaccinated, even if they did not die, would at least be extremely ill.

"As soon as the agricultural and scientific press had published the programme, and recorded Pasteur's prophecies, several of his colleagues at the Academy of Sciences, startled by such boldness in reference to a subject which had hitherto been enveloped in such profound obscurity, and fearing to see the illustrious company somewhat compromised by the affirmations in relation to problems of physiology and pathology, addressed some observations to M. Pasteur, on what they called a 'scientific imprudence.'

"The experiment began May 5th, 1881, at four kilomètres distance from Melun, in a farm of the commune of Poully-le-Fort, belonging to a veterinary doctor, M. Rossignol, secretary-general of the Society at Melun. At the desire of the Society of Agriculture a goat had been substituted for one of the twenty-five sheep of the first lot. On the 5th of May they inoculated, by means of the little syringe of Pravaz—that which is used in all hypodermic injections—twenty-four sheep, the goat, and six cows, with five drops of an attenuated splenic virus. Twelve days after, on May 17th, they reinoculated these thirty-one animals with an attenuated virus, which was, however, stronger than the preceding one.

"On May 31st very virulent inoculation was effected. Veterinary doctors, inquisitive people, and agriculturists formed a crowd round this little flock. The thirty-one vaccinated subjects awaiting the terrible trial stood side by side with the twenty-five sheep and the four cows, which awaited also their first turn of virulent inoculation.

"Upon the proposal of a veterinary doctor, who disguised his scepticism under the expressed desire to render the trial more comparative, they inoculated alternately a vaccinated and a non-vaccinated animal.

"A meeting was then arranged by Pasteur and all other persons present for Thursday, June 2nd, thus allowing an interval of forty-eight hours after the virulent inoculation.

"More than two hundred persons met that day at Melun. The Prefect of Seine et Marne, M. Patenot, senators, general councillors, journalists, a great number of doctors, of veterinary surgeons, and farmers, those who believed, and those who doubted, came, impatient for the result. On their arrival at the farm of Pouilly-le-Fort they found that out of the twenty-five sheep which had not been vaccinated twenty-one were dead; the goat was also dead; two other sheep were dying, and the last, already smitten, was certain to die that very evening.

"The non-vaccinated cows had all voluminous swellings at the point of inoculation, behind the shoulder.

"The fever was intense, and they had no longer strength to eat. The vaccinated sheep were in full health and gaiety. The vaccinated cows showed no tumour, they had not even suffered an elevation of temperature, and they continued to eat quietly."

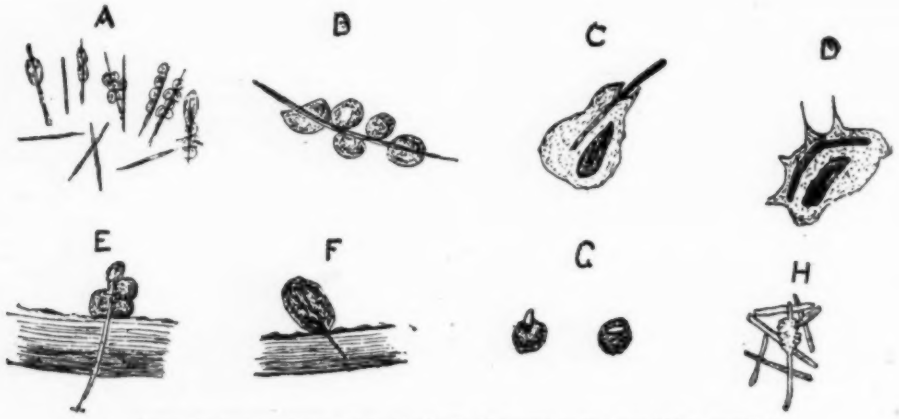
An extraordinary movement was everywhere produced in favour of vaccination. In 1882 the number of animals vaccinated amounted to 399,102, which included 47,000 oxen and 2,000 horses. In 1883, 100,000 animals were added to the total of 1882.

Some germs behave peculiarly, that of erysipelas for instance. If pigeons be inoculated with this germ, and then other animals inoculated with their poisoned blood, it is found the germ has become more deadly, whereas if passed in the same way through rabbits it gets weaker and less deadly. The poison of hydrophobia again, as Pasteur shows, if passed through monkeys diminishes in power, while through rabbits it increases. Constitutions, too, differ. Field mice inoculated give no result, while town mice inoculated with the same germs die of blood-poisoning.

At first, in the twilight days of germ-study, it was supposed that all germs were deadly. No germ is now, however, deemed worth fighting against unless four points have been proved with regard to it:

1. It must be found in the blood of the person who has the disease.
2. It must be isolated and cultivated through several generations.
3. It must produce the same disease in animals.
4. It must be found in the blood of these animals.

Then, and not till then, is the germ credited with producing the disease.



The presumed methods by which germs kill living beings open up wide fields for the imagination. It must of course, in the first place, be understood that the human body is composed of an infinite number of living, working, eating, drinking, breathing, and moving cells, getting on very well providing they are left alone.

Now one theory represents these germs swallowed with the food, inhaled by the breath, gathering their forces like an invading army, and entering into free fights all over the body with the legitimate inhabitants, on whom they fasten in ever-increasing numbers (think of propagating at the rate of one hundred thousand an hour!), and finally do to death. This, indeed, is more than a theory. A recent observer, rejoicing in the name of Metschnikoff, has absolutely seen the germs attacked and eaten up by the healthy blood cells. The accompanying startling diagrams are copied from drawings of his investigations, and represent the germs being actually swallowed and *digested* by the blood cells. We also see these cells eating the spores of the germs; and finally we see a group of germs surrounding and overcoming our valiant defenders. Such is the view of one of our most distinguished investigators.

Another theory, equally picturesque to the imagination, and doubtless true in part, represents them as stealing in imperceptibly to every part of the body, swarming into the blood, and there seizing on and intercepting all the convoys of provisions intended for the sustenance of the cells, and compelling these to surrender by sheer starvation.

Yet another theory, also founded on fact. These germs enter as before, congregate silently in the blood, and then proceed to wage war against the human cells by calmly breathing up all their air—or, in other words, absorbing all the oxygen the blood is striving to convey to them.

And yet another theory, still weirder. That all the previous theories do not represent what generally happens; that the germs do not, as a rule, destroy by any such means, but, on the contrary, under the guise of harmless inhabitants, live at peace with the cells, while all the while they are ceaselessly though secretly manufacturing a subtle poison, which slowly but surely saps the life out of their entertainers. For in any case the germs are uninvited guests, and may be compared to a marauding party of invaders quartered on an

A.—Germs (the long rods) attacked by blood cells (the round bodies) very highly magnified.
B.—A germ attacked by five blood cells.
C.—A large body cell eating a germ.
D.—The same cell after the meal.
E.—A germ having penetrated an internal organ attacked by four blood cells.
F.—A large blood cell eating an invading germ (which is seen partly digested).
G.—Blood cells eating germ spores.
H.—A number of germs attacking and destroying a blood cell which had been eating a germ.

unwilling family, who lay hands on all their unwilling host possesses, tap his choicest wines, revel in his best rooms, and fatten while he starves.

But our susceptibilities have been shocked enough. Let us try and reassure ourselves and rally our shattered nerves.

In the first place, things are not so bad after all. No enormous increase or devastating outbursts of disease have followed the alarming discoveries of the latter half of the nineteenth century, for as a matter of fact the discovery of these obscure vegetables did not create them. We have always had our germs with us, for good or ill. The death-rate improves in spite of them.

Then, again, the vast majority of them are harmless, and a cleanly and healthy man can safely breathe them, smile at them, and defy them, knowing that if they enter his body it is death to them, not to him.

Amongst the minority are the germs which have been convicted by the four tests we have mentioned of the following offences:

Of causing pneumonia (or inflammation of the lungs), of causing Asiatic cholera, of causing thrush, of causing a brown skin disease, of causing ringworm, of causing fatal carbuncle, of causing consumption, of causing leprosy, of causing intermittent fever, and of causing general blood-poisoning. Other individuals are under careful surveillance on suspicion of being concerned in the production of erysipelas, diphtheria, typhoid fever, and malaria; while those that produce hydrophobia, scarlet fever, measles, small-pox, and chicken-pox are still at large, but much "wanted" by their pursuers.

Various artificial weapons have been forged to fight these minute malevolent microspores internally, but with indifferent results. It is true they can be killed by antiseptics, but they die hard, and before a person well impregnated with them could be considered germless, the amount of carbolic acid, of corrosive sublimate, or other deadly drugs, he would have swallowed would in all probability have killed him. So, though the cure might be effectual, it would have the slight drawback of incidentally killing the patient first.

The wisest way is to kill as many as we can of the more deadly ones outside of us, and to run away from the rest—in other words, to use disinfectants (real ones) freely in all contagious diseases, and then to avoid the air or vicinity where such are known to exist.

One particularly good "tip" is never to approach possible infection with an empty stomach, but always after a meal, and to keep in extra good health and extra cleanliness when the enemy is on the war-path.

In sanitary precautions we act with equal care against those of "our friends the enemy" who are known only by their deeds, such as the measle germ, the typhoid germ, etc., as against those we know by their appearance, as cholera or consumption germs.

No doubt in some desponding and imaginative minds the foregoing columns will have raised a feeling that all resistance is practically useless, and that we must surrender at discretion, and that the wonder, after all, is that any of us are here at all.

Let us hasten still further to restore confidence.

In the first place, for any infectious disease to lay hold of a man there must be a happy, or unhappy, combination of three distinct elements of causation. There must be the soil in which the germ is to grow or flourish. In the case of consumption especially—that dread disease—is this true. A tendency, an inherited weakness, must, as a rule, exist first. But this is not all. Besides the *soil*, or certain delicacy of constitution, or susceptibility as it is called, there must be the *sower* and the *seed*. The seed is of course "the germ," the sower is that special act of imprudence that gave it its long-looked-for opportunity of dropping into the congenial soil awaiting it.

But there must be this threefold combination. Supposing the soil unfit—that is, too healthy—the seed is barren; it may be dropped in thousands, but it never germinates. Again, the soil may be suitable, the patient have a consumptive tendency, and yet never get consumption, by virtue of living in some pure dry air where the germs do not come, or if they come are so enfeebled as to produce no injury.

Again, the soil may be ready, the seed there, and yet the opportunity or sower is wanting. The patient, forewarned and forearmed, not, on the one hand, ignoring a susceptible state in foolhardiness; nor, on the other, brooding over it in despair, but laying the lines of defence like a careful strategist, avoids all occasion of catching cold; all sudden changes of temperature; all close and prolonged proximity to consumptive people; all damp and depressing climates; all extremes of fashionable clothing, such as fur cloaks, boas, and capes one moment, low dresses and ivory shoulders the next; attends to the general health and food; and by these and other means keeps bravely and successfully at bay the deadly foe.

That this is no imaginary or impractical sketch thousands are now alive to prove.

Two girls came to town only a short time ago, and seeing a wise physician, were by him warned of a constitutional delicacy of lung. One scoffed, the other heeded; the scoffer is dead, the other is still alive.

We would like to bring this uncanny article to a practical conclusion by indicating such of the general lines of defence as can be adopted by a non-professional reader against the list of diseases we have already given as believed to be due to germs.

And we are the more free to do this in that private medical practice can hardly yet be said to have reached the preventive stage, for seldom or never is the doctor consulted until the opportunity is past and the disease already at work, and this for reasons which we cannot now discuss.

Anyhow, it remains a fact that 1889 sees us with a carefully elaborated system of public

hygiene, and numerous officers enforcing it, while we are still without an efficient preventive service; and large reforms are needed before our present medical men can be expected to discharge these duties, or will even be thanked, much less paid, for doing them.

In, therefore, giving a few preventive hints here, I do not feel I trench upon any yet recognised ground of medical practice.

We have already indicated the lines of defence in *consumption*, and need not do more; for once the foe has taken the outworks and gained any foothold, it is the province of the doctor to intervene.

The next on our list is pneumonia, or inflammation of the lungs. The ways of prevention here are sufficiently obvious.

The next is cholera. Here, of course, we avoid all contact with any sufferer in every way down to the minutest particular, and never drink, while it is about, any *unboiled* water (not filtered only) or any unboiled liquid of any kind. (Beer, I believe, is a cold boiled fluid.)

Thrush is readily killed by borax in any form, which indeed is a deadly foe to most germs. It is prevented by antiseptic mouth lotions and great cleanliness, such as rinsing the child's mouth out after feeding with pure water. The brown skin disease, which has not a popular name, occurring in patches on the chest and back, is cured by vigorous scrubbing of the germs bodily away with soft or carbolic soap, and is prevented by daily and thorough skin ablutions.

Ringworm is prevented, when about, by washing the head with carbolic soap at intervals.

Carbuncle of a deadly kind generally comes from old skins or hides, and if exposed to the dust from them, is best prevented by wearing a good respirator, and keeping in outrageously good health.

Leprosy need not be spoken of in England, nor relapsing fever.

Blood-poisoning always arises from dirt, either breathed, swallowed, or received through some open wound. If we keep clear of dirt we shall never get blood-poisoning, only let us remember that the word dirt is here universal, and not only includes solid, but liquid and gaseous dirt; the latter, being invisible, often *inodorous* and unsuspected, being the common cause of this disease.

Erysipelas, again, may be prevented by the avoidance of the exposure of any wound, however minute, to the air. In this case, however, the trouble is perhaps greater than the risk.

Diphtheria is prevented by avoiding all possible contagion, and the strictest isolation of known cases, by keeping the mouth and throat guarded by antiseptic lotions and gargles, and by robust health.

Typhoid fever requires similar precautions to cholera.

Malaria can be steered clear of, as it only exists in known localities.

Hydrophobia needs no words, while the ordinary infectious fevers require the common precaution of absolute isolation, and of subsequent disinfection or destruction of every single article that has not only been used, but even been within the infectious area, including letters, books, etc.

We trust these few details will not be deemed too professional. We have simply enumerated them in the hope of possibly averting the dark shadow of infectious disease from falling upon our readers and their friends, from any invasion by our common foes.

Let not any, however, be misled by the word "infection" to suppose that therefore this catalogue of human ills are all infectious to the same degree.

Some are conveyable by contact only, others by the air, others mainly by fluids, and others again by clothes and furniture, while some, notably those of the lungs, are so very slightly infectious that the fact is still doubted by many, and is certainly not yet very clearly proved.

If this short article does not give our readers the nightmare, and does, on the other hand, impress them with a clear view of the value of preventive medicine and sanitary science, our fears will be at rest, and our object in writing fully attained.

ALFRED SCHOFIELD, M.D.

## THE KNIGHTS OF LABOUR.

IN America, as in England, during the last two decades, there have been strenuous efforts to organise labour. Almost every branch of industry has its Trade Union. One of the most powerful and best-managed is the Brotherhood of Locomotive Engineers. A larger and an all-comprehensive federation is that of the Knights of Labour. It is somewhat singular to find, in a country where the people are prone to be boastful of democracy, so many names drawn from the vocabulary and the usages of the Old World. Palace hotels, palace cars, royal gorges, and similar terms constantly occur. One of the most recent forms of church work among young ladies gives them the title of "The King's Daughters." The organisation, of which so much has been heard among the working classes of the United States, is called the Knights of Labour. Like the innumerable secret societies that abound there for social, benefit, and political purposes, this one has its insignia, its mystic initiation, its passwords, its gradations of officers, and its rigid rules.

Persons desiring admission, after careful preliminary inquiries have been made respecting them, are received in a dimly-lighted room by masked officials, and are made to take a solemn oath. They swear not to divulge any secrets of the order, to obey its mandates, and to assist their fellow-members. The lights are then turned up, and the signs, passwords, and other secrets are communicated.

Not long ago a membership exceeding three millions was claimed. The society had ramifications all over the American continent, including Canada. Nearly every trade and industry was included. A most elaborate network of ordinary assemblies, districts or general assemblies, and the grand body, with a Grand Master, Grand Secretary, and other high functionaries, spread itself from the Atlantic to the Pacific. Of late, however, the falling-off has been as great and as rapid as was the sudden rise. It is understood that the number of members is now considerably under one million, and that many of these are nominal, or are held by an extremely loose and frail thread. Various causes have contributed to this. The objects sought were, perhaps, too diversified, and some of them were, in the nature of the case, impossible of attainment. So far as concerned mutual help and sympathy, improved education, increased physical comfort, attention to the laws of health, and the social and moral elevation of the members, they could not fail to awaken public interest and to command the approval of every patriot, philanthropist, and social reformer.

In like manner it was reasonable to demand the abrogation of all laws bearing unequally upon capital and labour; the removal of technicalities, delays, and discriminations in administering justice; and due provision for the health and safety of persons engaged in mining, manufacturing, and building pursuits. Nor could objection be taken to requests for the weekly payment of wages in lawful and current money, without deductions for compulsory dealings at shops kept by or for the benefit of employers. The substituting of arbitration for strikes was one of the ends sought to be attained, most laudably, as everyone must admit who has seen the melancholy and wasteful effects that usually follow such appeals to blind force. It was further proposed to forbid the employment of children under fourteen in workshops, mines, and factories. There were other and similar designs in contemplation, and a few concerning which reasonable doubt might be entertained. Among the latter were the establishment of co-operative institutions, both productive and distributive. Their successful working entirely depends upon the character and ability of those charged with the administration, and requires more confidence to be reposed than the average members are found willing to yield. Such cases as the Rochdale Pioneers, and similar institutions in Oldham and elsewhere, show what is possible. But against these there are to be placed not a few conspicuous and disastrous failures.

It is also doubtful how far it would be practicable to abolish the contract system on national, State, or municipal work; or to secure for both sexes equal pay for the same kind and measure of work; or to have an enforced reduction of the hours of labour to eight per diem. Without pronouncing an absolute opinion condemnatory of these points included in the original scheme, there were others concerning which certain failure might have been predicted from the outset. "The alarming development and aggression of aggregated wealth" was spoken of in a loose and vague manner as something that must be checked. How the desired object was to be accomplished did not appear. One design was stated to be the bringing "within the fold of organisation of every department of industry." But organisation is only a means to an end, though many persons, on both sides of the Atlantic, appear to regard it as an end of itself. There is imminent danger at the present time of supposing that union, and mechanism, and resolutions, and committees, and all the other paraphernalia of societies, can accomplish what can only be effected by individual effort, or industry, or enterprise, or self-denial. Combination is good, when wisely directed to noble and practical ends. It has effected much for the working classes, and will accomplish more; but there are obvious bounds and limits.

"To secure to the toilers a proper share of the wealth they create" is stated as one of the main designs of the Knights of Labour. Assuredly many were induced to join in the expectation that high rates of wages would be secured or maintained. Many more questions are involved in this than can be discussed, or even stated, within the limits of a brief article. But it is obvious that two factors will always enter into the adjustment—namely, the amount of work required to be done, and the number of unemployed workers able and willing to do it. The more sanguine advocates of this great labour union in America thought that by embodying the mass of the workers against capital it would be possible to regulate production, sales, wages, and profits, so as to ensure high remuneration, and also to fix the price of all commodities. This was a Herculean and utterly impossible enterprise. It took no account of individual, or local, or climatic, or political, or trade circumstances. It presupposed knowledge almost universal, and capacities quite superhuman. It disregarded personal needs, tastes, aptitude, and capacity; and treated all the hungering, toiling, struggling, hopeful, eager units as a mere crowd. Human instincts and human necessities rebelled at this.

Some went even further. They denied all rights of property; they denounced capitalists as robbers; they demanded the establishment of socialism in its crudest forms. Others interfered with personal freedom of action in a way that brought them before the United States Courts. It was found also that action taken on behalf of one trade, or in one locality, was prejudicial to another trade, or to a distant locality. In several instances the action of the leaders in ordering a strike, or in precipitating a demand for increased wages, ended in signal discomfiture after untold and incalculable loss and suffering had been caused.

The American working people are too intelligent and too practical to embark in a hopeless undertaking, or to persevere in a course that is not likely to succeed. They have been trained to respect law and order, and the schemes of wild visionaries have no attractions for them. They, too, have something to lose, and they will not incur the risk. Hence, when they began to realise that some of the most important promises and projects of the Knights of Labour could not be fulfilled, they detached themselves as readily as they joined. The organisation may continue for a time in a lessening form in certain districts and in specific trades which have not efficient unions of their own. But as a gigantic federation of labourers in every place and of every industry, it has signally failed, just as repeated attempts to form a great National Labour Party for political purposes have failed. Within proper limits, and for the attainment of legitimate and practicable ends, Trade Unions, wisely and righteously conducted, have accomplished much for their members, and no just and reasonable employer would take exception to them. But they are voluntary societies. Men are at liberty to join; they have equal liberty to abstain. The rights of the individual must never be surrendered without his full and free sanction. Because the Knights of Labour forgot or disbelieved this, they suffered a great collapse.

# Varieties.

### Fast Trains.

The best English expresses are the fastest in the world. Our American cousins may beat us in some things, but they are behind us here. True, there is a record of a celebrated run from East Buffalo to New York, spoken of as the "West Shore Run," which it is said performed the whole distance of 422·6 miles in 9 hours 23 minutes, but, as Mr. W. M. Acworth points out in his interesting and informing book "The Railways of England,"[1] the Midland has covered "the 423 miles from London to Glasgow in three minutes less time every day of the week for the past six months." Still the West Shore train had certain stoppages, so that altogether it must be admitted to have been faster than the everyday Midland express.

But the Midland is not the first for speed in England. That distinction belongs to the Great Northern. On August 31st last year (1888), during the "Race to Edinburgh" days, the east coast—*i.e.*, the Great Northern and North-Eastern—train tore along to Edinburgh at "a speed of considerably more than 57 miles an hour all the way." It dashed over 392¾ miles in 412 minutes. This we gather is absolutely the fastest long railway run on record. And on the 13th of the same month the North-Western train raced in 427 minutes over 400 miles, a "rate of 56½ miles per hour throughout." But it appears that two accounts have been published of the American run, and in one account the speed is 54 miles per hour, and in another only 51. Even if the higher be taken, however, both our own Great Northern and North-Western have beaten it.

During an average run of 54 or 57 miles an hour, however, the train sometimes flashes along at a much faster rate, —we apprehend when gradients are favourable. "I travelled," says Mr. Acworth, "three times by the eight-hour expresses between London and Edinburgh and timed scores of miles—whenever we seemed to be going exceptionally fast —with a stop-watch. Very rarely were we going over 68; only once did I succeed in getting anything as high as 74 miles an hour; only once did I hear of 76 miles an hour being attained. Long after the excitement was over, I went down to Nottingham by the ordinary 10.40 a.m. Midland Edinburgh express, and timed 75 miles an hour, but neither guard nor driver would acknowledge that they had been running fast.'

In the West Shore Run no higher speed than 78 miles per hour seems to have been absolutely proved as attained, and this on the authority of Professor Hadley of Yale College, who at Mr. Acworth's request inquired into the subject. Indeed, Mr. Acworth says further on, "The conclusion appears to be that there is no authentic record of any speed above 80 miles an hour," and records of 80 miles an hour "are exceedingly rare," while "records of 75 miles an hour are as plentiful as blackberries."

The northern lines out of London have not a monopoly of fast trains. Thus the Great Western is famous for its 'Flying Dutchman' and 'Zulu,' though why the expresses received these names is more than we can say, unless the former was called after Marryat's Phantom Ship. However, the expresses on this line are timed to perform 77¼ miles from Paddington to Swindon in 87 minutes. The difference in even the slight gradient on this line between London and Swindon is felt, however, for whereas in tearing along to Swindon the driver appears to have difficulty in keeping time; yet in returning, on a day when Mr. Acworth rode on the engine, the train was actually in Paddington two minutes before time. Some of the miles were performed in 57, 56½ and 58 seconds! He went down on the engine of the 'Dutchman' and back again, 154½ miles, in 177 minutes, and had "a five minutes' interval for refreshments." "But," says he, "it was nearer three days than three hours before the writer's face resumed its pristine cleanliness."

The "Dutchman" was for some time the fastest express in the world. But it has had to yield to the Great Northern. The Manchester express of this company flashes along from Grantham to London at "a fraction over 54 miles an hour," while the "Dutchman" averages 53¼ only, "even as far as Swindon." But what is more, an account is mentioned by Mr. Acworth, "that the down train twice out of three times, and the up train five times out of six, gets over 60 consecutive miles of ground in 60 consecutive minutes, and that on one occasion the whole 105¼ miles" [between Grantham and London] "from start to finish were run in 112 minutes." This train is the 2 p.m. Manchester and London express, until last summer "undoubtedly the fastest train in the world." The "Sheffield Company" have a share in working this train, and we are told they take it from and to Grantham and Manchester.

The South-Western cannot boast of such speeds as these. But still it has a train which rushes to Exeter in 4 hours and 2 minutes, a distance of 171½ miles. This, however, is hardly 43 miles an hour. Then there is a train which reaches Bournemouth in 2 hours 29 minutes, a distance of 107 miles, and Mr. Acworth also says the chairman has spoken of arrangements being contemplated for executing the journey in two hours and a quarter.

The Brighton line expresses are not quite so good, though we believe there is an Eastbourne train that runs hardly 44

[1] Published by Mr. John Murray.

miles per hour. But the line from London to Croydon, "if not as far as Redhill, is," says Mr. Acworth, "terribly overcrowded and complicated with junctions." The South-Eastern and Chatham and Dover lines have also a few good expresses. The former has a train which rushes over the 75½ miles to Dover from Cannon Street Station in 96 minutes, and the latter has a train—not an everyday service, however—which in 100 minutes takes passengers from Victoria to the Admiralty Pier, and both are hard roads. Even the Great Eastern has good expresses. Several go from London to Ipswich, 68¾ miles, in 92 or 95 minutes, while Yarmouth, famous for its bloaters, a distance of 121¾ miles, is reached in 3¼ hours; Lowestoft, 117¾ miles, in 5 minutes less.

Fast trains are not more dangerous than others. In fact, "It would be much more accurate," writes Mr. Acworth, "to say that the very reverse is the case." The officials are all picked men, the engines and rolling stock are the best, and the signalmen are all on the alert. Yet celerity is not everything; and it must never be forgotten that an accident to one of these swift trains would be proportionately appalling. But what does it mean to the management of a company to run expresses throughout the day at a speed averaging little less than "a mile a minute"? In addition to the excellence of the officials and rolling stock, platelayers constantly watch the line to note if the proverbial screw be loose! There are a thousand of such men, according to our author, from Edinburgh to London at 30*s.* or 20*s.* per week. "The humblest carriage-greaser," he also writes, "may bring the 'Flying Scot' to an ignominious halt at a roadside station because he has allowed a pinch of dirt to get into his grease-box. These men, however, are to some extent under the eye of superior officers."

These splendid expresses are being run more or less in many parts of England. The North-Western runs ten expresses each way from London to Manchester every weekday. No other country can show such a sight. Whether electricity has anything in store with which to outrival such feats we cannot say.

F. M. HOLMES.

### Labour Institute for Working Men.

A correspondent at Lacovia, Jamaica, sends the following proposal for establishing central agencies, under State management, for finding employment for working men, instead of the usual tap-room "houses of call." We give his suggestion, without attempting to discuss the *pros* and *cons*:—

"The poorhouse and the workhouse are considered degrading by honest working people, and to a certain degree justly so! You tell the real hardworking man out of employ to go and seek relief at the workhouse, and he proudly answers 'he would starve first.' There are some who think this very disrespectful and impertinent; but it is the frequent answer of the independent labourer who has always held his own, asked no favours, and seeks work and not alms. Every State now has the two institutions—workhouses and prisons; the first in which to support a poor man before he has descended to crime, but to support him *as a pauper*, the other in which to confine and support him after he has pilfered somewhere a bit of bread to keep soul and body together. He comes out of either place an altered man. In the prisons you give the prisoners work to make them support themselves, and the outside labourers grumble at the convict competition. Would it not be cheaper, as well as more generous, for the State to support the honest man than the convict? I have many a time had men with despair written in their faces say to me, 'Only give me work, sir; I don't want charity,' and I had no work to give! At the same time, with a proper organisation, work might have been found. Those men did not want to go to the poorhouse; they did not want to beg. Some might starve, some might accept charity, and feel degraded ever after, and some might be tempted, and steal, and be arrested, and then the State had to support them *nolens volens*.

Now, could the State not reduce the size of its almshouses and its prisons by having an institution which should be the labourer's home, and of which he should be proud, and to which every labourer, out of employ, should have the right to go, applying for work and not for charity? The wage could be fixed at half what he could earn outside, so he would have no incentive to come except in bad times. A bed and a crust should be denied to no one; but for him who earned it, any fare should be there which he would pay for.

Materials of every trade should be on hand, so that the shoemaker could make a pair of shoes, the hatter a hat, the tinsmith a pan, and the tailor a suit of clothes, and the countryman could dig, for I would have land attached to the houses, where available.

A certificate of the institution that they were good workmen would be a thing sought after as a means of getting work in times when there was more demand for labour. A register should be kept, open to all, in which workmen could inscribe their names and trades, and to which employers of any class in search of labour could refer. Thus, the labourer would feel on going out again to the world that instead of being degraded, his certificate was a diploma, and there is no reason why such an institution should not be self-sustaining."

W. E. BOORAEM.

---

**The "Master Painter."**—This picture, of which by permission we give an engraving, is the work of the Belgian artist Jan Verhas, who was born at Termunde in 1834. He received from Nicaise de Keyser the great ideas of the modern Belgian historical school; but in 1870 he showed that he had found a path of his own. The "Master Painter," first exhibited at Ghent, is in the Museum of that city. It appeared again with Verhas' still more famous work, "The Review of the Schools," at the Exhibition of Belgian Historic Art in 1880.

**News of Mrs. Bishop (Isabella Bird).**—Mrs. Bishop, the celebrated traveller, left England to visit medical mission stations in all parts of the world. The latest tidings of her movements in this interesting pilgrimage record that after travelling for two months and a half in Kashmir, she reached Leh, the capital of Western Thibet, about the middle of July. She went thence to Nubra, and as far as the Sasir Pass on the Yarkand caravan route, receiving much kindness in the Thibetan villages which she visited. She was preparing to cross the Karzong glacier pass on her return to Ladakh, *en route* for the encampments of the nomad Chang-pas in Rupchu. It is stated that in crossing the fords of the Shayok, in attempting to leap up the river bank, her horse fell backwards on his side in deep water, with his rider partially under him. She was rescued by the Thibetan water guides, and escaped with an injured rib and a few bruises. Before leaving Kashmir the Maharajah made a grant to Mrs. Bishop of a very suitable piece of land, on which she is building a fully equipped women's dispensary, and a women's hospital of sixty beds, to be called "The John Bishop Memorial Hospital," in memory of her late husband. Both will be under the charge of Miss Butler, M.D., who has been some time in India, and who received her medical education in the London School of Medicine for Women. Dr. Butler will have one assistant, and the service of a trained nurse belonging to the Church of England Zenana Missionary Society. One object cherished by Mrs. Bishop is the erection of a permanent hospital in Nazareth, where medical missionaries have long laboured; but hitherto she has been unable to obtain a firman from the Porte. A sum far beyond her means was demanded in backsheesh to officials. The liberality of the Maharajah of Kashmir puts to shame the Turkish Government; but we hope she may yet succeed in her generous effort for the poor in Syria.

**Lord Macaulay appointing a Chaplain.**—When Lord Macaulay was Paymaster-General of the Army, the appointment of the chaplainship of Chelsea Hospital fell to his disposal. A letter which he wrote at this time to his friend Mr. Ellis gives a pleasing glimpse of his religious principles. The letter ran thus: "Dear Ellis, I have at this moment the disposal of a tolerable piece of patronage—the chaplainship of Chelsea Hospital; light duty, a nice house, coal, candles, and three hundred pounds a year. It would be an exceedingly pleasant situation for a literary man. But he must be a man of piety and feeling, for, the Hospital being full of old battered soldiers, the duty, though by no means onerous, consists chiefly in attending sick beds, and I would not for any consideration assign such a duty to a person who would

hurry through it in a perfunctory manner. Is there any among the junior fellows of Trinity who would suit? I do not want a politician, and nothing shall induce me to take a Puseyite.—Yours very truly, T. B. M." This letter shows not only his honourable conscientiousness, but his sense of the importance of true religion to convey peace and consolation. Would that his example were more followed by all who have ecclesiastical patronage at their disposal, in civil as well as military life!

**Royal and Princely Marriages.**—Recent events have made it sufficiently plain that the common opinion on the political insignificance of royal and princely marriages is not well founded. On this subject the Duke of Saxe-Coburg, in his "Reminiscences," gives his opinion and his experience. He says:—"People are accustomed to maintain that the marriages of princes in the nineteenth century have long ago ceased to have any political importance. The world, it is held, is enlightened enough to be no longer influenced, as it used to be, by the destinies of accidental matrimonial unions—the course of things in modern Europe is raised high above the personal relations and connections of a number of historical families. I hold this view of political life to be fundamentally untrue, and believe, rather, that people thus wilfully incapacitate themselves for forming a right judgment of many historical events. It is not my intention here to expatiate on the political importance of marriages in the reigning families in general; I can only remark, with reference to my own experience, that among the numerous marriages that have taken place in the families of relatives and friends, or of which I have been a witness, there have been very few that, in the course of events, have not reacted on public affairs. In very many I have observed that they have had an immediate and decisive influence on the home and foreign politics of the States; and that, even in our own days, the history of more than one marriage has been in this respect very little behind the marriages of the Bourbons, Hapsburgs, Tudors, and Stuarts of the sixteenth and seventeenth centuries. When has there been a time when women of princely families have not had a direct, and still more an indirect, influence over events? In glancing at the course of my own life, I would call to mind only the four sisters of the Bavarian Royal Family. How differently would we be obliged to represent European, and especially German politics, if we could turn our eyes away from these intelligent and influential ladies! Talleyrand's words, 'Où est la femme,' are applicable to nothing so much as to politics to-day."

**Infectious Diseases.**—The notification of occurrence of infectious diseases, already required in provincial towns having local Acts on the subject, has, by statute, become compulsory in London and the metropolitan district. It is required, under penalty for omission, for a householder to send notice of every case of infectious disorder to the District Officer of Health; and medical practitioners are also required to send notice. The addresses of the Health Officers appear in all parish broadsheets, and will be found on the printed forms for giving notice. The Act does not compel special management or method of disinfection in such cases; but the facts obtained by the returns may prove useful in discovering the origin of the disease, and in preventing its spread by proper precautions.

**The Metropolitan Police.**—From the report of Mr. James Monro, C.B., Commissioner of the Police of the Metropolis, we learn that the Metropolitan Police district extends over a circle whose centre is Charing Cross, and its radius 15 miles—that is to say it includes an area of 688 square miles, extending from Colney Heath, Herts, in the north, to Mogadore, Todworth Heath, in the south, and from Lark Hall, Essex, in the east, to Staines Moor, Middlesex, in the west. From this area must be excluded the City, which has its own force. The rateable value of the area was £34,642,779, "but," the Commissioner adds, "of the enormous actual value of the property in charge of the police it is impossible to form any estimate." Since the year 1849 there have been built in the metropolitan district 513,278 new houses, and 3,132 are still in course of erection; 1,853 miles of new streets have been added to the charge of the police, and the population has increased from 2,473,758 to 5,590,576, which means that, in regard to population alone, the cares of the police have considerably more than doubled—that is, they have increased 126 per cent. If we consider the numbers of the force who have to perform various duties among this vast population and in this large area we find that the authorised strength was made up thus:—30 superintendents, 837 inspectors, 1,369 sergeants, and 12,025 constables—a total of 14,261. With increasing population the force has to be increased, and the above figures show an increase of 17 inspectors, six sergeants, and 157 constables over those of the previous year. But sickness, casualties, leave of absence, and special duties sanctioned by various Acts of Parliament, take away a considerable proportion of the men, and the consequence is that only 9,037 police were left for duty in the streets. In 1849 the men so available were 5,288. So that while, as has been shown above, the population under their charge has increased in 40 years by 126 per cent., the force itself has increased by only 70 per cent. Something has been done in raising the numbers of the men, and providing stations and other accommodation for them. Of these 9,037 men available for duty in the streets, 60 per cent. are required for night duty from 10 p.m. to 6 a.m. The remaining 40 per cent. are detailed for duty in four reliefs in town districts, and two reliefs in country districts from 6 a.m. to 10 p.m. During the day the ordinary beat duty of the whole metropolis devolves upon about 1,561 men; and there are beside 522 constables at fixed points, and 88 at cab-stands.

**Aural Overpressure.**—The telephone and other modern appliances for aiding the sense of hearing seem to have rendered the human system liable to a new class of nervous maladies unknown heretofore in medical nosology. Operators in electric telegraph offices, with the perpetual bells and clicks, are also afflicted with a disorder which has been called telephone *tinnitus*. The perpetual strains on the auditory nerves, and on the whole organs of hearing, threaten to cause an injurious influence on large classes of people. It is one of the penalties of advanced civilisation to make the nervous system over-sensitive in various ways. Already the eyes have been affected by the inventions for helping vision, whether by the instruments or the artificial lights of modern science. The multiplication of readers and the increase of education tell in the same direction, especially as the cheap issues of papers and books in small type strain the organs of vision to an extent unknown to our less educated ancestors. The number of people wearing spectacles, even in early youth, is perceptibly increasing. If the organs of hearing are overstrained as well as those of vision, it may become common to see young people carrying ear-trumpets as well as wearing spectacles.

**M. Eiffel.**—When on a tour in Switzerland last summer, an address was presented to M. Eiffel by the people of Ormont Dessus. In his reply the illustrious French engineer gave expression to his religious belief, and inculcated the duty of placing the love of God above even the love of liberty or of country. Like Cuvier, and Ampère, and Chevreul, and other eminent men of science in France, Eiffel is ready to avow his Christianity when too many have been sceptics or agnostics.

**Duff Memorial.**—A Celtic cross with portrait medallion of Alexander Duff, D.D., was inaugurated on the 21st of September, 1889, near the road from Pitlochrie Station to Moulin, where the great missionary was born and bred. At the head of the committee for this national memorial were Sir William Muir, K.C.S.I., Principal of the University of Edinburgh; Dr. George Smith, the biographer of Duff and of Carey; and other men distinguished in Indian and Scottish annals.

**Signs of the Times.**—Among the numerous congresses held during the French Exposition, there was a gathering of Spiritists and Spiritualists. The airy and hazy discussions were on one occasion interrupted by outbursts of merriment, when a Spiritist averred that he left his wife at home in the country, and suddenly met her in the building on the Champ de Mars. He was going to argue from this as to the reality of psychological and physical dualism, when he was stopped by roars of laughter. The confession of faith and the logic which led up to it caused cachinnation loud and prolonged,

even among the most serious members of the Congress. The Freethinkers of France and from foreign parts also held their Congress. They were received with open arms at the Hôtel de Ville by Citizen Joffrin, and afterwards by M. Chautemps, President of the Municipal Council. M. Joffrin said that the majority of the Council were of the freethinking fraternity, and that they believed it to be necessary to do away with the idea of religion, which made "serfs and sweaters." Dr. Paepe, a leading Belgian *libre penseur*, and Dr. Voelker, a German, spoke, insisting on the fraternity of Freethinkers all the world over.

**An Imperial Joke.**—It is related that while the German Emperor was staying at Osborne a conversation took place one day touching the similarity of many words in English and German. "Ship," and its German equivalent "schiff," were among the examples brought forward; whereupon the Prince of Wales remarked that though the words were alike the genders were different; in German it was neuter, in English it was feminine. "Ah," said the Emperor, "you are quite right; a ship must certainly be feminine, for it costs so much to keep up."

**Paris in 1889.**—The Prefecture of Police returns show that for May, June, and July the hotels and lodging-houses had 224,000 provincial guests against 133,000 in 1888, and 120,000 foreigners against 49,000 in 1888. Assuming August and September to have had a proportionate excess over the previous year, the Exhibition will have brought to Paris hotels 200,000 extra visitors.

**Leather Wear and Waste.**—There are 3,000,000 of people who walk about London's streets daily, and in so doing wear away a ton of leather particles from their boots and shoes. This would in a year form a leather strip one inch wide, and long enough to extend from London to New York. The amount of disintegrated sole leather at 5*d.* per lb. (what it costs consumers), would amount to £100,000.

**Icelanders as Colonists.**—The success of the Icelanders as colonists in Manitoba has suggested that they should be induced to settle in Alaska also. As there are only about 60,000 native Alaskans in a territory as large as the whole of the United States east of the Mississippi and north of the Alabama line, there should be room enough for the whole population of Iceland, where less than 75,000 are scattered over a country as large as Ireland. Alaska probably would be more attractive to them than Manitoba, as they are accustomed to live by fisheries rather than by raising wheat. No kind of grain has been grown in Iceland for more than 1,000 years, with the exception of a few small patches sown recently by way of experiment. The first settlers probably did grow barley, if not wheat, as we read of the use of ploughs in the early Sagas.

**Inhabitants of a Cheese.**—A Swiss professor announces the discovery of living organisms in Emmenthal cheese, of a minuteness which he describes, as in the proportion to mites, as probably a million to one! He estimates them as being three to five millions in a single gramme. He even detects, under the microscope, many different species of these caseous microbes.

**Li Hung Chang and the Peace Society.**—Mr. William Jones, late Secretary of the Peace Society, has been travelling in various parts of the world, advocating the interests of peace and other good purposes in which the Society of Friends take a leading part. He had a long interview at Tientsin with the viceroy, Li Hung Chang, the Bismarck of China, and the admiring friend of General Gordon, whose loss at Khartoum he deeply deplored. Li Hung received the peace emissary with great favour, and warmly approved the principle of settling international disputes by arbitration and not by war. He strongly advised Mr. Jones to visit St. Petersburg, and lay his views before the Czar; laughing heartily when the reply was that he would be put in prison for his pains if he went there.

**Agricultural Destitution and Harvest Festivals.**—Mr. Walter Gilbey, on behalf the Royal Agricultural Benevolent Association, says he is sanguine enough to look forward to a time when it will hold such a position in regard to our annual Harvest Festival services that its claims upon them will be generally recognised, and that, in the same way as our Hospital Sunday services are devoted to furthering a specific object, so our Harvest Festival services may be held mainly in furtherance of some benevolent agricultural cause. During the last two years especially this feeling has gained ground among the clergy of all denominations, and its result is shown in the fact that nearly £6,000 was received by the society last year as the result of collections at places of public worship, as against £1,800 in the year 1885. This increase in the funds of the institution ensured the election of 200 pensioners in 1888 and 1889, as against 113 only in 1886 and 1887. At the present time 739 persons are being maintained by the society, at an annual cost of £15,626, these 739 recipients consisting of farmers who during twenty years have cultivated as an exclusive means of support holdings of at least 100 acres, or at rentals of at least £150 per annum, and who have attained the age of sixty-five years; also the widows and unmarried daughters of the above. The secretary of the institution is Mr. C. B. Shaw, 26, Charles Street, St. James's.

**Coal Supply.**—Professor Hull, Director of the Irish Geological Survey, and a distinguished traveller as well as scientific writer, reassures those who are doubtful as to the continuance of England's commercial supremacy by his strongly expressed opinion that there is enough coal in Northumberland and Durham alone to last, at the present rate of consumption, for three hundred years. Many other parts of England have large coal-fields, with abundant supply for a much longer period.

**Steel Hardening and Tempering.**—The hardening of steel is effected by rapid cooling of a mass of metal highly heated. The tempering is produced by reheating this hardened steel to a temperature far short of what it was raised to before hardening. The proper tempering of steel is one of the most important processes in all metallurgic art. The material is capable of being worked in the highest artistic forms for which wrought iron was once famous, being as strong and more ductile than iron; while for rails, for artillery, and for pens steel is likely to be exclusively used. For the manufacture of pens the amount daily used is above eighteen tons.

**Commissariat of Paris.**—During the summer of 1889 it was estimated that the quantity of meat (exclusive of poultry and *triperie*) sold daily in Paris varied from 430,000 to 480,000 kilogrammes. Half a million of eggs, 50,000 kilogrammes of fish, and 850,000 kilogrammes of vegetables must also be added to the list. The kilogramme is equal to two and one-fifth English pounds.

**La Savoyarde Bell.**—A bell larger than the great bell of Notre Dame, and giving a lower note than the Cathedral *bourdon*, is to be constructed at Annecy, in the Department of the Haute-Savoie, for the Basilica of Montmartre. The bell will be called "La Savoyarde," and will cost £2,800, which has been subscribed by the inhabitants of the two Departments of Savoy, on the initiative of the bishop, Monsignor Leuillieux. Parisian Catholics now look forward to possessing as fine a bell as that of St. John Lateran, of Geneva, or of Ghent.

**Consolation in the Struggle for Existence.**—The Darwinian doctrine of "survival of the fittest" has certainly a painfully depressing influence when we realise how there is throughout Nature a fierce and often cruel fight for existence. In this struggle the weakest go the wall, and the whole study of Nature reveals a selfish care for self, and a remorseless disregard for other living creatures and organisms. In the case of human lives there is the same struggle, but here there is the interference of moral and of Christian influence to repress the strong and protect the feeble. In an interesting lecture by Mr. Gardiner, Professor of Botany at Cambridge, before the British Association, the battle of plants for existence was illustrated by numerous examples. There are many in our day who believe that in many members of the vegetable kingdom, as well as in the animal kingdom, there is consciousness of pain and of trouble. In that case the struggle for life is all the more a doleful and depressing condition of

Nature. Sir John Lubbock, in moving the thanks of the meeting to the lecturer, threw out a hint full of compensating consolation. Although the struggle for existence caused woe to individuals, yet the sum of weal, whether in the lower creatures or in the human race, is advanced in the process. Moreover, there is often as much true happiness in the struggle for existence as in existence itself, with the certainty that the struggle tended to a higher and better condition of Nature.

**Trade Statistics of the British Empire.**—Respecting the progress and wealth of our Empire beyond the seas, Sir Rawson Rawson has done a special service in formulating the precise percentage of importance which each holds in the great mass of Imperial trade. He takes the year 1885 as affording the most complete statistics when he constructed his tables, and for his special purposes it answers as well as a later. Taking, then, the total trade of the Empire in that year at one thousand millions sterling, we find that the contribution of the United Kingdom to this total was 61·4 per cent., and of India 16 per cent., leaving 23 per cent. to be divided among all the rest of the Empire. After India and far below it, New South Wales and Canada come with 3·8 per cent.; Straits Settlements, 3·4; Victoria, 3·2; New Zealand, 1·3; Queensland and the Cape, 1·1 each; South Australia, 1; and all the other possessions considerably less than 1 per cent. each. Western Australia, for example, ambitious to become a "responsible" colony, with all her enormous territory, contributes only 1-10th per cent. to the trade of the Empire. The precise measure of the commercial importance of the colonies to the trade of the mother country is exhibited in another table. Their total contribution to the trade of the United Kingdom is a little over 26 per cent. Of this India contributes 9 per cent.; Australasia, 8; British North America, 2·9; the Cape and Natal, 1·3; Straits Settlements, 1·1; the West Indies, 1; and all the rest less than 1 per cent. each.

**Mysterious Marks.**—The story of the baker whose loaves were stamped with HIC JACET, after repaving the floor of his oven with a smooth stone from the adjacent churchyard, has been capped by an extraordinary incident recently occurring at Maryport, Cumberland. The wife of a labourer in the town gave birth to a son. When the child was born it was found that its head was covered with a caul. The veil was placed on one side, no notice being taken of it until some hours after the child's birth. When subsequently examined it was found that the words "British and Foreign Bible Society" were deeply impressed upon the veil. When this discovery was made the greatest excitement prevailed in the neighbourhood, some of the women declaring that nothing short of a miracle had been enacted. The doctor, who inquired into the matter, however, soon explained the affair. The veil whilst in a pliable condition had been placed upon a Bible, on the cover of which the words "British and Foreign Bible Society" were deeply indented. The words were in this way transferred to the caul. Some of the inhabitants still ascribe the affair to supernatural influence, and declare that the child is a missionary born, and will evidently watch his career with a great amount of interest.

**Burns Festivals.**—A Scottish paper has the candour to say that it is a pity, for the sake of Burns's reputation, that the rites celebrated in his honour partake so entirely of a convivial character, and that so much prominence is given to the "barley bree," devotion to which was the source of so many of the troubles and miseries of his unhappy life. In many of the Burns Clubs in America no intoxicants appear, yet there is no lack of patriotic enthusiasm.

**Rabbit Plague in Australia and New Zealand.**—So great has been the damage caused by the pest of countless rabbits, that a reward of £25,000 was offered by the Government for the discovery of an effectual check to the invading hosts. M. Pasteur's plan of introducing diseased rabbits, so as to spread the fatal malady among the multitudes of devastators, has been rejected by all the colonies. The dangers of such an experiment are too great; as cattle, poultry, and men themselves may be exposed to peril. The "British Medical Journal" approves the decision of the colonists, saying, "It is impossible to foresee what may be the ultimate consequences of the experiment which it is proposed to make on so gigantic a scale. The mere fact that the microbe is capable of producing fatal disease in two animals so dissimilar as domestic poultry and rabbits ought to serve as a warning that it may presently develop into a pestilence affecting other species of animals, and possibly even man himself; for it ought to be remembered that, once the disease is introduced into the rabbit warrens, it has passed beyond human control." Meanwhile the plague continues, in spite of every method of checking its progress. The only effective protection is the costly one of surrounding whole districts with wire fences. This can avail only for a time, as the rabbits will soon burrow under the fences and multiply in the enclosures.

**The late Emperor Frederick of Germany.**—"He was not only the most lovable, but the noblest man with whom I have ever associated,—noble in his acts, noble in his speech, noble in his judgment of others." This was said by one who had seen and known him in the most varied and trying circumstances, General Sir Beauchamp Seymour.

**An Edison Autograph.**—During his recent visit to Paris, Mr. Edison was entertained at the Eiffel Tower by the Society of Civil Engineers. Before leaving he wrote his name in that *libre d'oro*, M. Eiffel's visiting book, prefacing it with the following words: "Top of Eiffel Tower, September 10, 1889. To M. Eiffel, the brave builder of so gigantic and original a specimen of modern engineering, from one who has the greatest respect and admiration for all engineers, including the Great Engineer, the *bon Dieu*.—THOMAS A. EDISON."

**Orchid Growing.**—An American paper says that the well-known financier, Mr. Jay Gould, is one of the most extensive amateur growers of orchids in the country, and at his handsome summer home, at Irvington-on-the-Hudson, there are now thousands of rare specimens of orchids in bloom. Among them there is one that is especially fine, the *Cattleya labiata*, of the mouse variety. This flower was discovered by Frederick Mau, in 1883, in the United States of Columbia. It takes the form of a butterfly, the petals and sepals being pure white, with purple lips fringed with delicate white lines. Of these there were several in bloom this summer. Orchids of this variety have sold in London for as high as 1,000 guineas. The widths of the sepals and petals are from nine to ten inches respectively, while the length of the lips is about three and a half inches.

**Bi-metallism and the Silver Question.**—At the International Monetary Congress, held this autumn in Paris, M. Cernuschi, one of the Vice-Presidents, announced a competition in these terms:—A prize of 10,000 francs will be presented to the author of the best essay describing what effects would be produced on the reciprocal value of gold and silver now and in future if the following monetary system were simultaneously introduced and made operative in Great Britain, Germany, the United States, and France—namely, free and gratuitous coinage for everybody, and a bi-metallic monetary unit, the standard coin for silver to be of the weight and fineness of a five-franc piece, and the standard coin for gold of the weight and fineness of the United States gold dollar. The manuscript essays are to be sent to the Bank of France or Bank of England before May 1st, 1891.

**Walvisch Bay.**—A correspondent of the "Times" advocates the abandonment of Walvisch Bay, the only good harbour on the West Coast of South Africa. He says, "Walvisch Bay is absolutely useless to us now that the German possessions in South-West Africa surround it. The small area of land—some twenty square miles—attached to the bay, and belonging to Great Britain, is barren sandy desert, and produces nothing to feed the settlement, which has actually to fetch its drinking water from Cape Town. On the other hand, Walvisch Bay, as the only good harbour in a coast line of twelve degrees, the entire extent of the German sea-board in South-West Africa, is indispensable to the proper development of the German colony, and as such might be to us the means of effecting a profitable arrangement with Germany, if the Cape Government will agree to the cession, and if the Portuguese are made to give up Delagoa Bay to cancel their debts to England."

# Household Queries.

We propose as an experiment to give some space every month to the Answering of Questions on subjects of household interest. This feature we introduce in deference to the wishes of some of our readers, as a means of direct communication with families. No notice will be taken of anonymous letters, and only such questions replied to as are in their bearing of general utility.

---

**Whooping-Cough.**—*Is whooping-cough infectious at every stage? Can it be communicated through a third person?*—To the last question, almost certainly yes. We have actually known of two children catching the infection through being simply carried into the garden through a house in which the disease prevailed. The first question is not so easily settled. Many authorities of experience believe that the characteristic whooping often remains some time, from a kind of habit of the nervous mechanism, after all specific contagion has passed away. But, on the other hand, no one can tell *when* any such innocent stage is reached, if it ever is; and generally it must be said, that all growth in our knowledge increases rather than diminishes belief in the contagion of these disorders. They are all spread solely by neglect or ignorance *somewhere*, and all should be careful to run no risk any precaution can avoid. It is not, fortunately, a long-permanent contagion in a house, like scarlet fever.

**Enamel.**—*In applying the new popular enamels, or "Aspinalling," as I see it now called, ought wood or palm-fans to be sized before applying the enamel?*—They are supposed to be used direct, but all varnish paints are best kept from spreading on porous surfaces by first sizing. Make a little pretty strong size with gelatine.

**Drainage.**—*Can a landlord be compelled to set the drainage of a house in order? We are troubled by bad smells in the underground rooms.*—There is a very common misapprehension on this point. By equity and custom he is; but legally he is not, unless it is said so in the agreement. If there is no agreement he cannot be compelled. With a house taken furnished it is somewhat different; in such a case actual loss or damage becomes a question for a jury, and contradictory decisions are reported; but on the whole it is safe to say the landlord would be liable, a verdict having been obtained this very year. Health is, however, too precious to risk delay in legal squabbles. Get them put right first, and see what you can do with the landlord after, unless you can leave him.

**Moths.**—*What is the best means to adopt to get rid of the moth from a couch—moth, grub, and eggs being in it?*—Furniture so infested requires time and constant vigilance, as the eggs are not killed, and treatment must be continued till each successive batch is killed, as long as any are left to hatch. If you have a small bare room, a very good way is to repeatedly fumigate with burning sulphur at due intervals, as if disinfecting clothing. If you have not, or are afraid of the colour being affected, apply Persian powder freely and frequently, killing all as they come out, for it seems rather to stupefy than to kill. It will help, also, to keep it constantly scented with any strong aromatic scent or camphor.

**Defective Kitchener.**—*A friend asks me why her kitchener, which burns well, does not brown the meat or poultry, but, though cooking it through, gives it a rather sodden appearance. Can you help her?*—It is probably from one of two causes. If the oven ventilator is not sufficient, or is not sufficiently opened, and the steam is shut in, such an effect would often be produced. Or, on the other hand, the flue arrangements may not give enough of what is called "top heat." It is quite possible there is a little ventilator, or door leading into a flue somewhere, which has never been noticed by the servant (such things often happen), and attention to which will remedy the evil. If you know the maker of the stove, write and ask. The French remedy all defects of this kind by browning things with a salamander, but this implement seems scarcely ever used in England.

**Whitewash.**—*Can you give me a receipt for making whitewash just to do the scullery or area and the fowl-house?*—Whitewash requires careful mixing. For work like the fowl-house it is best done by stirring common quicklime into water and using hot, with a little carbolic acid added. For indoor use whiting is stirred in. If you add to this a little size, and a very little blue, you get what is used for ceilings, and with more size you get distemper, which can be coloured with yellow ochre or any other colour if you prefer.

**Worn Cloth.**—*Is there any way of restoring black diagonal cloth when rendered shiny by friction? Many plans tried and failed, and the tailor does not seem to succeed.*—Very little indeed can be done, as, if you look through a magnifier, you will see the texture is very peculiar, being almost destitute of nap. There are two sorts of this cloth, one looking "hard" from the very first. This should be avoided by all to whom economy is an object, as it becomes shiny far sooner than the soft-looking material. A little may be done to freshen it, though far short of restoration, by sponging till thoroughly wet, but not sloppy, and then briskly rubbing with a wet linen cloth. Pressing will of course be needed after. It is doubtful if the result, on this cloth, is worth the labour.

**Floorcloth.**—*What will best preserve the face of linoleum or floorcloth in the hall, or the oak-bordered floorcloth in the dining-room?*—You probably know that durability largely depends upon the time the fabric has been made and kept in stock; hence the plain, old-fashioned patterns are so often far more durable than more showy new ones. There is a kind of linoleum made now in which the pattern goes right through to the very back, so that it never wears off until a hole is worn right through. The great thing is never to use a scrubbing-brush, but wash with a soft cloth, and, if possible, plain warm water only, though, if necessary, a little soap may be used. The floor must, however, be rubbed thoroughly dry immediately with another soft cloth or towel, and not left in the damp. This is essential, and rough cloths must be avoided. Finally, go over the surface with a small flannel dipped in milk—two tablespoonfuls in a saucer will do a fair-sized hall. Some rub in a little oil instead of milk, but we find the milk best ever since we were given these directions by a large manufacturer; and we once had the same piece (one of Hare's best) in use in four houses during eighteen years—not that it was exactly a show specimen at the end, of course. The oak-bordering will, of course, not need washing, or scarcely ever, but should be kept nicely dusted, and a little linseed-oil thoroughly rubbed in once a week. In rooms, oil is best, as it keeps the fabric from tending to crack with the warmth of the dry room. In the hall, oil on good cloth is very slippery.

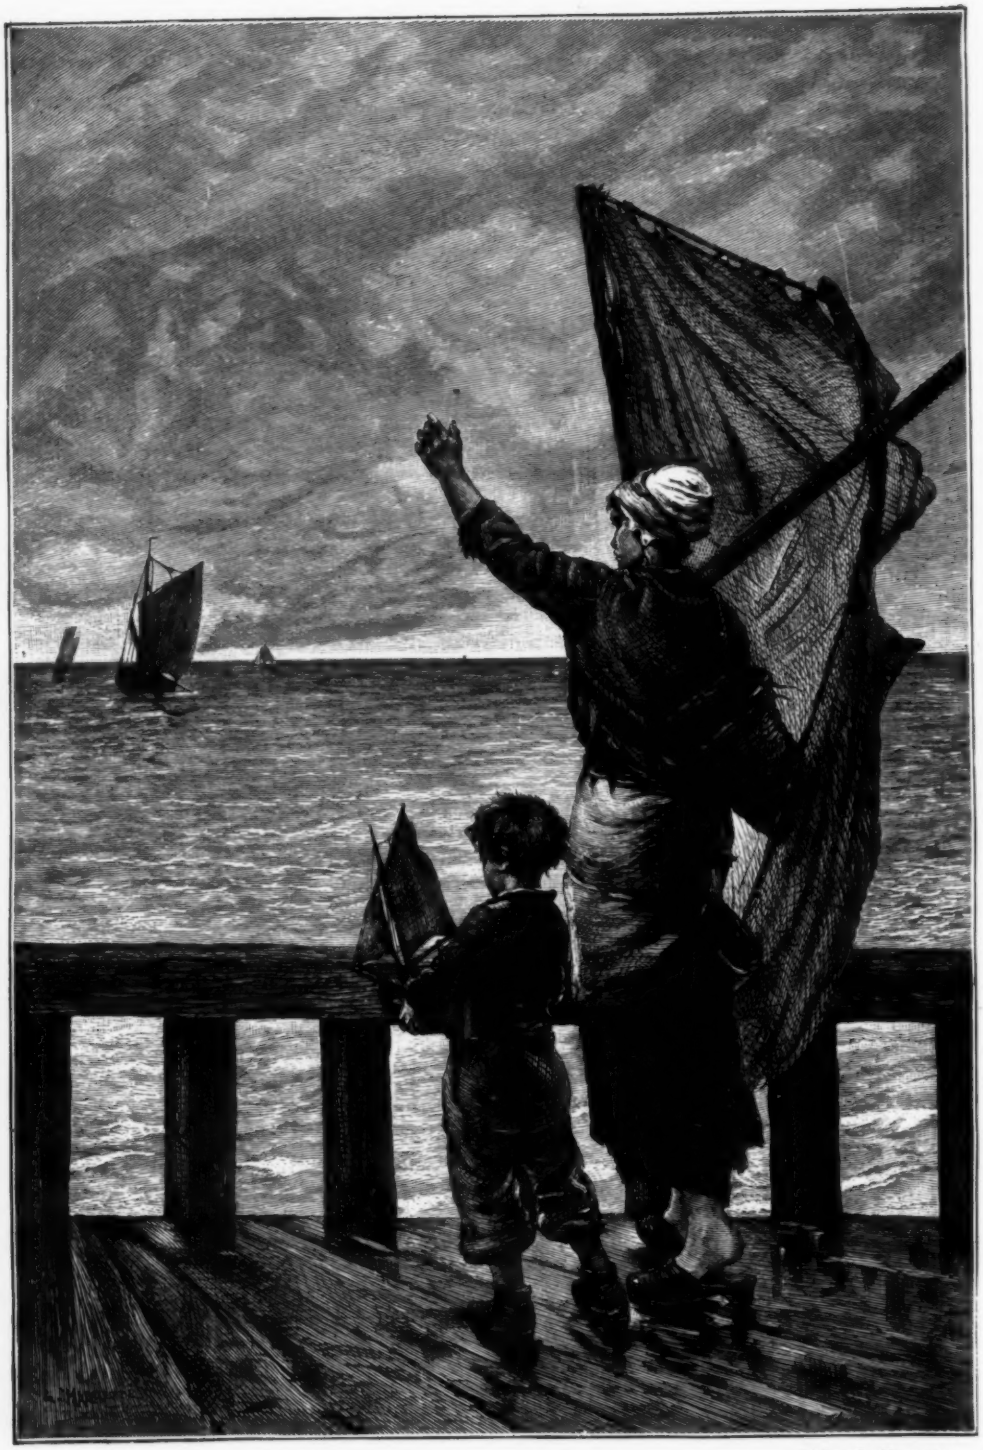
**Wall-papers.**—*What colours are to be preferred for wall-papers?*—This depends, first, upon many circumstances; and when all these have been considered, upon personal taste.

You will gain more practical help by noticing the colours in all the houses you visit, and their *effect* upon you, and studying the reasons, than from any direct hints we can give. Size and height of rooms, aspect, what the room is, and even whether it is to be brightly lighted and filled with company or not so, have all to be considered. Also, if the rooms are already painted, and you do not mean them to be done again, the papers must be chosen to harmonise, and the same with carpets and upholstery you have. Generally speaking, cool colours of the sage-green class are best for sunny rooms, warm colours for colder and dull aspects. Taste is almost universal for soothing colours for dining-rooms, and bright pale colours, such as will harmonise with sparrow-egg blue or green paint, or ivory paint, for drawing-rooms. Bedrooms also should be bright and cheerful, but above all things avoid for them all *patterns* which tempt the mind to count or combine, which to an invalid is often a kind of mental torture. Do not have both frieze and dado unless the room is high enough; and if only one, take a dado for the dining-room and a frieze for the drawing-room.

**Stains in Marble.**—*Entering on a new house, I find the builder's men have left stains of paint, varnish, etc., on the marble mantelpieces. How can I get rid of them?*—You cannot be sure of getting out such stains, because if they have sunk to any depth and entered into a chemical combination, as some colours do, the effect cannot be altogether undone. For this reason most of the recipes abounding in domestic handbooks are of very superficial and uncertain efficacy. However, make a paste by mixing equal parts of soft-soap, quicklime, and caustic potash. First slice off any dry paint, that no more may soak in by the very means used: then apply above with a brush and leave on for a week, wash off and apply again and again fresh stuff, kept in a stoppered bottle. This has got off some dreadful stains, but if it fails, wash off with warm water well, and then apply some oxalic acid in water, rubbing on and off quickly with a small piece of cloth, and after a few minutes rubbing again with lime and water to remove the acid. This may probably remove more or less of the polish, but it may be restored by rubbing either with chalk and water, or putty-powder and water, applied with a cloth. Or a marble-worker could grind off the stain and renew the surface for you.

**Stains on Ivory.**—*Through carelessness in washing the ivory handles of knives, they are stained with vinegar, etc. How can they be cleaned so as not to destroy the polish of the ivory?*—We cannot guarantee success, for the same reason as is given to another querist, but the following will give you the best chance: Clean what you can with a bit of rag and methylated spirit; then apply to the places a cream or thin paste made of fresh-slaked lime, containing a little chloride of the same. Leave on for a few hours, then wash off. If the result is promising, though not quite effective, repeat. If any of the polish is removed, you can renew it by rubbing with whiting or putty powder. Prevention is far easier than cure of these things.

**Oleanders.**—*We are afraid to keep the pretty pink-flowered oleander in our greenhouse because it is apt to be infested with mildew or a black blight. Can this be prevented?*—The black is another stage (fruit) of the mildew. Nerium oleander is not generally considered specially subject to it. The great cause of mildew is a stagnant atmosphere, and it may often be checked, or even quite cured, solely by free ventilation and attention to the vigour of the plants. When affected, the remedy must be frequent syringing, either with Evans's mildew composition, one ounce to the gallon of tepid water, or you may boil a pound each of quicklime and finely-powdered sulphur for ten minutes in an earthen pot in five pints of water, and when syringing shake up the bottle and add one part to 100 of tepid water. The plant does better with occasional sponging, which if attended to may probably keep off the above as well as the red spider, to which it is otherwise rather subject. Do not forget the deadly poisonous character of this plant.



**Furnishing.**—*We have just taken a house of £30 a year rent. Can you give us any hints for economical furnishing?*—This subject might fill a chapter rather than a reply. By the way, querists would assist satisfactory replies by being a little more specific. There is no address on this question, and no envelope has been forwarded; and in some parts of England £30 would mean a good house every way, while in large towns it of course means a very modest one indeed, which we will assume here. Let us say first, that all *general* modern customs favour more economical furnishing than formerly. Have, therefore, all the floors bordered, either with floorcloth, or the stain and varnish sold on purpose, or in the bedrooms even plain paint, half a yard from the walls, and the carpet as a loose square or pieces, and thus save money and gain in health. Brussels is now the cheapest carpet for hard wear. Iron or brass bedsteads, with good wire mattresses, give the same results. You can dispense entirely with the old expensive mirrors, and be perfectly in the fashion, with either overmantels, cheaply furnished, or a simple double mantel-shelf and a little pottery, or even a plain mantel-board with a few ornaments and an engraving or picture over. Get a dining-room set of chairs if you can afford it; but if not, good Austrian bent wood will look very respectable, wear well, and can have loose cushions added. A modern plain buffet is cheaper and better for such a house than sideboard or chiffonier. As to the drawing-room, this is now always furnished for real use, and the expensive centre table and "suite" has quite given place to one or two small tables, and as many chairs as are wanted, every one of which may be different, and all of which may be quite cheap, even plain basket with a cushion being quite permissible even in well-furnished rooms. All this is much cheaper than the old style, and so are cheese-cloth and Madras muslin curtains, which are durable, and only want the simplest washing and ironing. Even in the hall, if it is small and you cannot afford a table-stand, it is quite the thing now to turn a drain-pipe up on end in a saucer, paint them in some decorative way (if you know how to do it), and make this answer for an umbrella stand in the corner, while a row of handsome pegs can go anywhere. The modern fashion, in a word, is for *individuality*. Look round and consider what you really want, find where you can get it best and cheapest, and then add as you go along.

**Charitable Purposes.**—*A correspondent from an "old parsonage" asks us, if a large old-fashioned house in a large garden a few miles from a great city were left for charitable purposes, is it better it should be an almshouse for old people, or a free library, or both combined, or what else?*—We conclude that the terms of bequest are yet to be settled, for if not, there must be some knowledge of the testator's wishes which ought to be respected. But even in settling them, the testator and his adviser ought to be guided by actual circumstances not stated in the question, and not by mere outside opinions which would vary on every hand. What is *wanted* in the place, which is within reach of the bequest? This again must greatly depend upon whether the house alone is left for the purpose, or any sum of money to defray, or help towards other expenses. An almshouse may be wanted or may be needless—an institute may have a fair prospect of doing much good, or very little. If neither seems indicated and there is money as well, a small convalescent home or cottage hospital might do untold good; but if there is the property alone, the object must be confined to such (as the two suggested, for instance) as can be carried out with little beyond Christian superintendence beside. Local knowledge applied with principle must decide.

---

# SENIOR AND JUNIOR

## A COUNTRY TOWN CHRONICLE.

BY LESLIE KEITH, AUTHOR OF "GREAT GRANDMAMMA SEVERN," 'THE CHILCOTES,' ETC.

### CHAPTER V.—RIVALS.

"IT IS MY PARTICULAR WISH THAT YOU SHOULD BE FRIENDLY.

UPON cross-examination Mrs. Hallett's information did not amount to very much.

The old man lying dead in the house to which they were drawing near belonged to a generation that had passed away, and the more active part of his history lay so far back as to be scarcely within Mary Hallett's cognisance; but it was matter of tradition in Melchisford that his only child, a daughter, had run away from an uncongenial home with a very undesirable husband. A "play-actor," or a circus-rider—Melchisford was divided in its opinion as to the exact profession of the bridegroom, but it was unanimous in agreeing that Mr. Hallett never forgave the offence. Beyond this little was known, but it was understood that once, and once only, the un-

fortunate wife, very speedily disenchanted and deserted, had made a piteous appeal to her father, which was absolutely disregarded, though she pleaded more for her baby than for herself.

Mr. Hallett shut up the Place and went abroad. Rumour was rife about his doings; but in those days, when a man might explore the world without the certainty of coming across his nearest neighbour at home bent on the same errand, little that was authentic could be gathered, and his movements remained obscure until he suddenly came back again and settled down at Hallett Place, bringing a young grand-niece with him.

"She must be older than you, Hetty," said Mrs. Hallett, "for I remember well hearing of the day when he came to the office to put his affairs into papa's hands—a London lawyer had managed them till then—and papa thought it a great thing to get so good an estate to manage."

"But that doesn't determine Miss Kelynge's age."

"No, but it was when you had the measles; you were just four, and Mr. Hallett spoke of the little girl whom he had adopted as if she were at least seven or eight. He talked about getting a pony for her, or a governess, I don't remember which."

Hester laughed.

"They had both to do with her education, like my measles."

"It was then that papa advised him to try and find his grandson," said Mary, with a note of pride in her voice. "Papa was always on the side of the young fellow, but Mr. Hallett would not listen. For years he refused, and it was only the other day, so to speak, that he yielded and consented that an effort should be made to discover him."

"And now papa is on the other side," said Hester, with some wonder in her voice.

"No, dear; only he thinks there is little hope of tracing him. You see he has been lost sight of so long, and he may be anywhere. They have tried every means for a year, and they have no clue."

"If his father was an actor he ought to be easily traced."

"But he wasn't anything great. A strolling player does not make himself a name, and the boy may never have heard of his mother's family. It was a dreadful marriage for her to make, and her pride may have kept her silent after her father refused to take her back. I think she would be too unhappy and ashamed to tell the boy anything about her early life."

Hester listened in silence, pondering over the story. It was like a novel; all its situations were melodramatic—the strolling player, the lost heir, the waiting fortune—only it was better than any novel because it was true, and it belonged to Melchisford. Hester had a pleasing conviction that she should live to see the romance concluded—the wanderer discovered and made happy for ever after. Young people never take into account the stories that stop short, and are, to all seeming, never finished at all.

They were now within a mile or two of Hallett Place, and here the face of the country was less familiar to them, and they began to look about them with a quickening interest. Yet the same terms might describe it all—a green country, with a cheerful hint of spring's activities to take something from the look of sadness there always is in any wide-reaching distance; a country of broad white roads, with straggling, overgrown hedgerows keeping guard on either side. You can see the sinuosities of those roads for miles and miles as they wander between the fields and loop the scattered hamlets, here a wood and there a spinney, bearing names that you will find in Domesday Book; a row of bare elms, where the rooks hold parliament, a scent of new-ploughed earth, a blue sky above it. It has everything, and yet nothing. It is not beautiful, this old East Saxon county, as its rivals of south and west are beautiful, and its charm is difficult to describe; yet for some minds it certainly exists. It has that subtle quality of attraction that escapes analysis but that ensures sometimes for a plain face the love that beauty cannot command.

"Mother," said Hester, turning round suddenly, "did you see who that was?"

"No," said Mrs. Hallett, looking helplessly out of the window. "I saw something whisk past; Davies drives so slowly. Was it Dr. Shepherd?"

Hester smiled.

"It was Lavy Moss."

Mrs. Hallett sat up and looked at her daughter seriously.

"Are you sure, Hetty—are you quite sure?"

"Quite sure. She was alone, and she looked back and waved her hand. I ought to know that cock's plume," she said, with a little demure fun curling her lips, "I see it often enough going in and out of the bank-house."

Mrs. Hallett drew her brows into a perplexed frown.

"I think it is very forward of her to be rushing off there at once, as if—as if she were a relative. Papa will be annoyed," she ended, with a sigh.

"Dear mother, why should he be? Miss Kelynge has a right to choose her own friends, and if she likes Lavy Moss—"

"Hetty," said her mother, with an appeal that was almost piteous, "don't begin defending the Mosses, or—or trying to make a friend of Lavy; that would only make matters worse."

"I won't choose her for a friend, I have no real friend but you, mother," said Hester, reassuringly. "You know I am not popular in Melchisford."

"I am sure that is not true, child."

"Oh, yes it is; and I don't think Lavy would appreciate my friendship."

She did not quite understand her mother's agitation.

"It will displease Andrew because it is Hannah Mellish who has done this, and she is on my side," Mrs. Hallett was saying to herself. "He will think I ought to have prevented it."

Hester could scarcely appreciate these subtleties of feeling; she knew that her father disliked the Mosses and Drinkwaters, and all the tribe of relations to whom her Uncle John's marriage had given the run of the bank-house, but she did not

see how that affected Miss Kelynge and her choice in friendship.

"If she likes Lavy Moss she won't like me," she said to herself, instinctively recognising that she had no qualities in common with the lively young woman who had so lightly wrested the lead and won the race, but not resenting the preference. Hester had a strong sense of justice. "It is for her to choose," she thought.

"I wish Davies would go faster," said Mrs. Hallett, her good-natured face drawn into lines that were almost fretful.

She put her head out of the brougham and gave the order, but Davies was neither to be cajoled nor commanded. He had no mind to knock up both his beasts, he remarked, and if there was to be all this going and coming, his mistress must be content to take it quietly.

"Davies never can forget that he has been in the stables since your father was a boy," said Mrs. Hallett, unable to help smiling at the snub. "We must submit, I suppose."

"We shall be there in five minutes. Look, mother; put your head out at this side. There is the famous beech avenue. How beautiful it must be in summer!"

It was beautiful even in March. Between the bare branches, already rose-tipped with promise, one had glimpses of the park, where the deer were feeding in sociable groups. A bend of the long drive brought the house in sight, for advantage had been taken of a little rise in the ground to set it well in view. It was a large old house of the mellow brick that is as unlike the brick of London as imitation marble is unlike that hewn from the quarries of Carrara. It was not confessedly of any period—not pure Elizabethan, not Queen Anne, certainly not Victorian; but it seemed to have claimed the best points from every style, and the result was a picturesque and thoroughly comfortable jumble.

Perhaps, set in its wide solitude, it was a little dull, in spite of the flower-beds coming into bloom on the lawn. To-day it was even sombre, with all the blinds drawn, and that air of death that seemed in so strange a contrast with the bustle and rush of spring in sap and shoot. There were fresh wheel-marks on the gravel of the drive that told of Lavy's arrival, and it was still of her Mrs. Hallett was thinking most when she crossed the threshold. Hester's recollections had gone back to the dead man, and she pitied him for having to go away, leaving behind him this beautiful world.

Mrs. Hallett took her daughter's arm as she crossed the hall, where other Halletts looked down upon them. Her nervousness was beginning to return, but it took the shape of dread before encounter with Miss Moss.

They were shown into the library—a dark room, made gloomier by the close-drawn blinds. A fire had been lit, and it touched the binding of the books, bringing out unexpected twinkles and flashes of light.

"What a beautiful room!" said Hester, looking about her with admiration. "I love that dark oak. And what a number of books! I wonder if Miss Kelynge has read them all."

While Hester was wondering the door opened. There was a little pause, and then someone came in. Mrs. Hallett, not yet accustomed to the darkness of the room, could not feel sure for a moment whether it was not the enemy after all; but Lavy Moss could scarcely have taught her step that subdued hesitation. A moment more, and she knew it was the mistress of the house.

Perhaps, on the whole, Miss Kelynge was the more embarrassed and shy of the two as she came forward. She was short, and rather broad and flat, though not stout, and possibly her chief attraction lay in a sort of helpless appeal that she made, not only by her expression, but by her general attitude.

The woman of a timid and confiding nature is generally supposed to be very popular with men—especially if she be pretty; but there are women too, to whom anything in the shape of helplessness makes a demand that is immediately met. Mrs. Hallett's shyness vanished as she took the girl's cold hands in her own.

"My dear," said she, "you know me? I am Mary Hallett."

"That is my name too," said Miss Kelynge, looking up with a kind of wonder into the good face bending over her, "except that I have Kelynge added on." It seemed to make a little bond between them, and Mrs. Hallett went on quite bravely:

"My daughter Hester and I came to see if we could help you. We fear that you must be very lonely, and my husband begs that you will return with us and let us try to comfort you. He will arrange for you to return here as often as you will, and Hester with you if you dislike driving alone."

Miss Kelynge turned to Hester with the same curious, half-frightened, deprecating air. She had light blue eyes with very light lashes, eyes that looked as if they had shed a great many tears and had grown faded in consequence. Her complexion was dull and thick, and her features blunt; she was not pretty—even Hester, who was gentle in her judgments, could not find her so—but she looked as if she wanted taking care of.

"You will come?" Hester bent forward with a smile to add her persuasions. "My mother is very kind, and she will take care of you, and you shall be as quiet as you like."

Miss Kelynge coloured with distressful embarrassment.

"I don't think I can come," she said, hesitatingly, "though I should like it. I am dreadfully frightened here, I daren't go upstairs where he is lying, but Miss Moss has come to stay with me—she arrived just before you."

At the mention of the enemy's name Mrs. Hallett drew herself up a little, and her warm feeling suffered a check.

"Of course if you have made other arrangements," she said, "we must not interfere. If Miss Moss is a friend of yours—" Then she melted under the frightened gaze.

"She has only come to stay because I was so lonely."

"If you will not return with us, is there nothing we can do for you?" Mrs. Hallett asked. "You have so many books that we have nothing to offer you that would be new to you, and perhaps you don't care to read yet?"

Hester looked round her again. Somehow she was certain Miss Kelynge had not made acquaintance with the calf-bound rows that glittered so mysteriously in the firelight.

"If you have any commissions we will do our best to execute them," her mother was saying; "we have some good shops in Melchisford. Barker's is almost as good as a London shop, or if you would like Hester to write to London—"

"I get my things from Slipperfield; it is nearer—only five miles. I have only been once or twice in Melchisford in my life. I used to want to go, but uncle wouldn't; he said it was easier to write to London and give orders, and less trouble than to drive nine miles for our things."

She gave her explanation hesitatingly, as if she were conscious of a blunder somewhere. While she was still speaking the door opened, and Lavy Moss came in. There was no uncertainty about her entrance. She walked straight up to Mrs. Hallett and put out her hand, as if confident of a cordial reception. If ease of manner be a sign of gentle breeding, the farmer's daughter ought to have changed places with Miss Kelynge.

Lavy was a good-looking lass, with a fine healthy colour and an air of great resolution and spirit.

"How do you do?" she said; and then she turned and nodded to Hester. "I passed you on the road. I wagered Uncle John Mellish a new pair of gloves I'd beat you, though I started a good half hour after you, and I've won. I met Aunt Hannah in George Street, and when she told me the news"—she glanced at Miss Kelynge—"I bundled into Tom Burgess's trap, and off I set. He wanted to come with me, but there wouldn't have been much chance of winning if Dewdrop had had his weight to drag behind her. He'll get a lift home," she laughed, "and Dewdrop won't come to any harm here."

"You got here before us, certainly," said Mrs. Hallett, with the coldness a kind woman can put on; "but we had no intention of outstripping you, since we did not know you were to be here."

"Didn't you?" said Lavy looking at the speaker, with a careless frankness that did not trouble itself to be unfriendly. "I thought Aunt Hannah told you. She said, anyhow, that you couldn't take me; but I got here all the same. I've come to stop as long as Mary wants me. There's lots of us at Chalk End; it's the only thing we're rich in, and I can easily be spared."

Mrs. Hallett understood that the gauntlet was thrown down, and there seemed to be nothing left to do but to retire with dignity.

She refused Miss Kelynge's offer of refreshment, and the bell was rung for Davies to come round at once. The visit was ending a little awkwardly, and Mr. Hallett would be displeased; but she could not help it.

As she was crossing the hall with her guests, Miss Kelynge seemed to struggle with something she wanted to say, but she did not say it until Hester and her mother were seated in the brougham with the rug tucked across their knees. Then, as they were making their final bows, rather stiffly perhaps, she ran down the steps with desperate impulsiveness and put up a hand to check Davies in his outset. "Thank you for asking me," she said, speaking fast and growing very red. "If you will let me come to-morrow—after the—I daresay Lavy won't mind to-morrow."

"Yes, my dear, yes," Mrs. Hallett interposed quickly; "do come, it will be such a trying day for you. My husband and son will be here, and will bring you back to us."

"If Lavy doesn't mind."

"Do come; I may tell my husband you consent?"

So it was as a conqueror Mrs. Hallett drove away after all, leaving Lavy round-eyed and wondering, staring after the departing carriage; but she did not enjoy the victory.

"Hetty," she said, "Lavinia Moss is odious."

Hester looked round a little surprised at the energy of the tone.

"Did you hear how she spoke of Mary—so familiar and forward, as if she were an equal?"

"It doesn't seem so very difficult to be Miss Kelynge's equal. I can pardon Lavy that freedom."

"Hetty, you really must not defend her."

"No, mother; I won't, unless you say anything very severe. Lavy is certainly better looking than Miss Kelynge; I thought her quite handsome to-day, and I suppose some people like that outspoken way—it really is rather funny."

"I can't think how you can admire her."

"Oh, I don't—that is, not more than moderately. I'm afraid I was only using her as a comparison. Miss Kelynge isn't pretty—she is very plain, don't you think?"

"Oh, very," said Mrs. Hallett, easily.

"But she seems good-natured. I am sure she will give everything up to that boy when he is found."

"That boy?" Mrs. Hallett looked bewildered, and then she laughed. "Why, my child," she said, "if you mean old Mr. Hallett's grandson, he must be quite a man—older than Andrew."

"Oh!" said Hester, a little blankly, "I keep thinking of him as a little fellow in pinafores."

But a young man, even if he were older than Andrew, has scarcely passed the bounds of romance in the eyes of twenty, and she quickly resumed her loyalty.

"Whether he is five or seventy-five," she said, with that lack of logical sequence so characteristic of the feminine mind, "he is the heir, and you can't deny that, mother."

### CHAPTER VI.—ANDREW JUNIOR SEES VISIONS.

THE coroner's jury had but to give their verdict in accord with the medical evidence, which proved conclusively that old Mr. Hallett had died of syncope, and the funeral immediately followed.

There were not many left to mourn him—he had been a man of morose and peculiar temper, who had easily estranged himself from his neighbours. Moreover, he had outlived most of his early associates in the county, and his only brother, the grandfather of Miss Kelynge, had long predeceased him.

They laid him beside his wife—dead many years before—in the chancel of Slipperfield Church, where a handsome mural monument testified to her many virtues. By-and-by the graver would come and chisel in his virtues too, and all those fine qualities which no one had perceived in his lifetime. It was a cold day—one of those days when Spring hides her smiles and betrays her shrewish temper. The easterly wind made even warm-blooded young Andrew look blue, and it was still more cruel to Mary Kelynge, reddening her nose and her eyes, and accentuating her unattractiveness. She cried a good deal at the grave in a silent, helpless way, as she had cried at the inquest, out of habit, perhaps, or nervousness, for she had not been deeply attached to her grand-uncle.

Young Andrew chose to ride home, leaving his father to accompany Miss Kelynge in the brougham. She made the young man uncomfortable, and upon the whole he felt rather irritated with her. She ought not to have cried; she ought rather to have been grateful for her handsome chances. Andrew himself would have managed to unite gratitude and grief in more becoming proportions if he had had her prospects.

Andrew senior, seated beside all this crape and these tears, did his best to be comforting. He said—as if he were a brother of La Trappe, bound to the shibboleth—that we must all die, an assertion his companion would have found it difficult to contradict even if she had been nimbler-witted than she was. When he spoke of Hester, and of the mild pleasures to be enjoyed at Melchisford, he became more fluent, but he found his companion unresponsive, and he was not sorry when the brougham drew up at the Red House in George Street.

It was dark by this time, too dark for their arrival to be witnessed from the bank-house, where, as Mr. Hallett very well knew, both Hannah Mellish and her niece Lavinia were on the outlook. He smiled rather grimly to himself as he thought of their discomfiture. He had a fine masculine contempt of women as opponents, and if there was to be any fighting over the possession of Miss Kelynge he had no doubt in his own mind as to the result of the combat.

The Red House sent forth a diffusing sense of warmth and good cheer that was pleasant and reviving after the outer rigours. The spare chamber—the best in the large house—was all ready for the guest. Mr. Hallett had himself inspected it before leaving home in the morning, and had superfluously suggested that the fire might be lighted early. When a man takes it upon himself to interfere with the housekeeper's functions he does not often distinguish himself. Mrs. Hallett, like a good wife, had acquiesced with a smile; she had nothing left to learn in her own department, though she bowed to him in everything else. The fire had already been lighted for two days, and the sheets and blankets duly aired, when Miss Kelynge took possession of it. It was as comfortable a room as even an heiress could desire, with a couch drawn up to the warmth, a few flowers, some books, and a silver reading-lamp on a little table.

Hester came to offer her services.

"Will you let me be your maid?" she said. "I help mother often. I will unpack if you will trust me, and I feel sure I could do your hair if you would let me try. Or perhaps you would rather lie down and rest till dinner-time?"

Miss Kelynge agreed that she would rest.

"I never had a maid," she said. "Uncle used to say a woman ought to be ashamed to ask another woman to dress her. I never had anybody like you to help me."

She looked at Hester with a mixture of perplexity and admiration, and possibly with a shrinking that almost amounted to a chill. Hester was so serene, so tall, so beautiful.

"I am not very clumsy," she smiled. "I will come for you at half-past six, and you will let me try to be of use to you?"

Andrew junior had got home before his father. He had changed his dress, and was standing with his back to the fire when Andrew senior came into the room.

Mr. Hallett warmed his chilled hands; perhaps his son's comfortable attitude irritated him. He said rather sharply:

"You'd better go down to the cellar and get up some of that Jouet—a couple of bottles."

Andrew lifted his black brows with a kind of surprised remonstrance.

"Perrier Jouet—for a girl?" he said. "I'm afraid, sir, it will be rather thrown away. So long as champagne pops and bubbles in the glass, any brand will do for ladies."

"Ladies like good wine when they can get it," answered his father, a little curtly, "and I wish the one who is our guest to be treated with all possible respect."

Andrew went to the cellar without another word; he, at least, could appreciate the Jouet. He had merely mentioned a general principle. Andrew did not like waste, and it was waste to produce Jouet when a humbler vintage would serve your turn equally well.

When he returned to the dining-room carefully carrying the wine, his father still stood at the fire. He looked a trifle pompous, and perhaps rather more cross than before, and his son knew that there was a little lecture to follow.

"You ought to have come back in the brougham," Mr. Hallett said, not giving his annoyance time to cool. "It was scarcely respectful to ride off in that way, without so much as mentioning your intention. We waited for you quite half an hour, and might have been waiting now if someone had not chanced to go to the stables."

"I'm very sorry," said Andrew, with frank and careless penitence. He was, generally speaking, on sufficiently easy terms with his father, and was troubled with no old-fashioned subserviency. "The fact is, I couldn't stand any more tears. If a woman must cry, why can't she cry and have done with it, instead of dribbling on for ever, like a—"

"You had better not make the comparison, sir; you must be more respectful towards a very natural and—er—womanly and becoming grief."

"Becoming?" murmured Andrew.

Mr. Hallett went on more sternly: "I am shocked at your want of feeling; it is abominable."

"But it isn't natural," interrupted Andrew, anxious only to cut the lecture short. "The old man was not an affectionate uncle, if rumour is correct, and did nothing to merit tears on his account. In fact, his dying becomes him better than ever his living did—that, at least, is my way of looking at the matter."

"And I call it a very unfeeling way of looking at the matter. You will be good enough, sir, to keep your opinions to yourself, and to treat the lady with the respect and consideration that are her due. You will remember that this is my house, and not yours; and that I will not submit to have anyone I invite here insulted."

"Insulted!" cried Andrew, in his turn growing very red. "Who says I insulted her?"

"I say so, sir." Mr. Hallett nursed his passion. "And I insist that you will treat Miss Kelynge respectfully, and behave to her as a gentleman ought to behave. She will probably be here for a long time—that is, if circumstances do not interfere."

Andrew stared at his father. A new idea began to dawn on him and displaced his anger.

"And"—Mr. Hallett went on, suddenly stumbling over his words and losing the fluency his passion had given him—"and so you may as well understand at once that I expect you to take your share in trying to make her feel at home here. I won't have you give yourself any airs. You will be courteous and kind and friendly. It is my particular wish that you should be friendly."

"Very well, sir," said Andrew, quietly; "I will do my best."

What was there in these phrases that made Andrew suddenly stop frowning and look at his father? There was nothing in the words—it was only a roundabout way of saying that he must be civil to a girl who was, in a certain sense, under his father's care. The lawyer liked long words, yet there was more than met the ear. There was a subtle intention in them that did not escape him. He said nothing more, but he looked at his father, and the look was returned in an equal silence. After all, words are very clumsy vehicles, and there are moments when they can safely be dispensed with.

Andrew was not an imaginative young man, but in the half-hour that elapsed before the dinner-bell rang there had been time for one of those onward mental leaps that cover a good deal of ground, and take one suddenly into a new region. The mind very quickly adapts itself to a new conception, and it is matter of common experience with most of us to discover that while we have been readjusting our world on a new scale of feeling, others have remained at the old emotional level.

When Miss Kelynge came down before dinner with Hester, it somehow gave Andrew a slight shock to find her quite unchanged from the young woman he had left crying silently in the drawing-room at Hallett Place. He felt, irrationally enough, that his own quickened consciousness ought to have touched some responsive spring in her. She was not crying now, though the tears seemed not far off; but she looked depressed and nervous, and in her black dress, with her faded, reddened eyes, her dull, yellowish colour, and her tremulous lips, she was undeniably very plain. What possible marvel could have happened in half an hour? And yet in half an hour Andrew had taken one of those resolutions that are epoch-making in a life. In short, Andrew had determined that if fortune were minded to throw her favours in his lap he would make the most of her kindness.

The dinner, in spite of the champagne, was not very successful; there was a constraint on everyone, and an uneasy dread lest some chance remark should open the floodgates of Miss Kelynge's grief once more.

She ate very little, could hardly be persuaded to sip her glass of wine, and looked so unhappy that even Andrew felt his confidence die away before the task of consoling her.

"Poor little fool!" he said to himself, as he smoked his cigar in the greenhouse; "if she would stop slobbering, and do up her hair differently, and wear a decent gown, she wouldn't be so infernally bad."

Already he was thinking of her as if he had a sort of proprietary interest in her, and was bound in honour to emphasise all her better points. How dutifully he was obeying his father!

"Hester would put any girl to disadvantage," he thought, feeling for the first time a little annoyed with the beauty to which Miss Kelynge acted so successfully as a foil. "I wonder if it would frighten her desperately if I were to talk to her?"

He felt himself amused before this conception of himself as an awe-inspiring person, and, resolving to put the question to the proof, he threw away the end of his cigar and entered the drawing-room. Miss Kelynge, however, had retired, and Hester sat at the piano playing soft, idle snatches as the fancy came to her.

It was her mother's lullaby. Mrs. Hallett was just at the age when an after-dinner nap begins to have attractions, when, in a place like Melchisford, it almost becomes a resource. For even if you have the good fortune not to discover it, Melchisford is undoubtedly uninspiring, circumscribed, and dull.

Andrew stood in the doorway and looked from his mother, her fair, placid face gently relieved against the dark cushion of her chair, to his sister drooping over the piano.

Hester when she played had a spiritual likeness to St. Cecilia, borne along on the current of her own pure maiden fancies. Andrew, who had no close acquaintance with the Romish calendar, would probably have been incapable of the comparison, but he instinctively recognised a certain moral daintiness and exquisiteness that gave her beauty a rare distinction. For the moment, however, it almost offended him.

He had the grace not to waken his mother, and he asked in a careful whisper, "Where is Miss Kelynge?"

Hester, without ceasing her playing, motioned with one hand that their guest had gone upstairs.

From the dining-room, which opened into the drawing-room, though shut off by double doors, there now came a bass murmur of voices.

"Who is it?" Andrew questioned once more, inaudibly, and Hester's lips softly formed themselves into the words, "Dr. Rose."

Andrew turned on his heel and went round by the other door to the dining-room. It was clear his chances of laying the foundations of a friendship with the young lady were gone for that night, and he rather liked Dr. Rose, whose gloomy views of life the young man found humorous.

Dr. Rose was a man of sixty, long and lean, and of sour visage, who was understood to have in early life contracted an unfortunate marriage which had checked a career of more or less promise. When he was still a young man he had sold his practice in London, and came to bury himself in Melchisford. It was understood that death had relieved him of his rash matrimonial venture, but not even the most optimistic of maiden ladies had any hope of persuading him to a second experiment. It was commonly reported, indeed, that he was a woman-hater, and he took care to keep this impression alive by hurling most of his sarcasms at the heads of his married friends. He lived in dingy lodgings in South Street, and was content to find his practice chiefly among the poor, leaving the whims of richer patients to his more pliable coadjutor, Dr. Smee.

"Smee will tell them as many lies as they will swallow for ten-and-six a visit," said the sneering Esculapius; "the truth as I tell it only fetches half-a-crown. But the truth is the last thing your patient desires. If she is a woman, she only wants you to assure her that hers is the most interesting case you've ever met with; if the dregs of conscience left you rebel at that, you may as well strike her name from your books, for she won't send for you in a hurry again."

"And the men?" said young Andrew, who enjoyed a thrust at the opposite sex.

"And the young men, sir, are worse if possible than the women. It ought to be within a doctor's province to drown half of them, like puppies, before they are old enough to do much harm."

It was not, however, on this favourite theme that the doctor was enlarging as he sipped a glass of the lawyer's port; and indeed, when Andrew entered the room, it was his father who was the speaker.

The topic was that which for the moment was engrossing all Melchisford—the death of Mr. Hallett and the prospects of his niece, and it was one in which Andrew felt he had a right to share. He nodded to the doctor, and leant against the mantelpiece with his back to the fire.

"I think she is pretty safe to come in for as fine a property as there is in the county," his father was saying, "and a thoroughly well-invested fortune into the bargain—all good sound securities, Indian Consols and British Railway Preference stock—none of your risky investments. That intermarriage with the Carters was a capital thing for the Halletts; it brought them all that iron business—nothing like iron for your money. To be sure, there's a year for the grandson to turn up in. If he can make good his claim any time within twelve months from last Tuesday at midday, everything real and personal goes to him, except a trifling annuity. If he fails to appear—and I scarcely think there's one chance in ten that he will turn up—she inherits."

"And if he turns up five minutes after midday Tuesday a year?"

"Then he must console himself by knowing that he has lost by three hundred seconds."

"Fate is like enough to play him some such scurvy trick," said the doctor, "it is a way she has. And the young woman—what will you do with her?"

"Shepherd and I are the trustees; but as Shepherd is a bachelor, she can't live with him."

"No; Shepherd scores there. Shepherd is a Solon among men."

"I suppose she will be here for a time," said the lawyer, carelessly, "if she find Hallett Place too dull. But it is entirely a matter for her choice, she is free to live where she will. By-and-by, when she is out of mourning, we must get her to go to London; she ought to see something of the world."

"My advice to you would be to lock her up for a year, though unfortunately it seldom has the desired effect in a woman's case. If you let her go about, even in Melchisford, some young man will be fancying he is in love with her; it isn't difficult to fall in love with a young woman who has the prospect of sixty thousand a year."

"You speak as if you had a warrant in your pocket," said young Andrew, in a tone that was not wholly amiable, for the doctor was looking straight at him, and the young man had an uncomfortable conviction that he understood him a little better than he intended or approved.

"If I had, I should use it to clap the gaol door on you."

"Oh, so you think me dangerous?" said Andrew, a shade of stirred vanity arresting his ill-humour.

"No," said the doctor, with a most sarcastic smile, resolved not to indulge him; "I don't think you at all dangerous except to yourself. Let us suppose, for the sake of argument, you should happen to fall in love with £60,000 a year; you have to reckon that Fate may choose to play her dirty trick on you. Five minutes before twelve would be quite as fatal to you as five minutes after it to the other young fellow; and so, my dear boy, incarceration and a temperate diet of bread and

gruel would be the kindest treatment anyone could prescribe for you."

On the whole, Andrew had never found the doctor's peculiar humour so distasteful.

### CHAPTER VII.—"FRANK.

OLD Mr. Hallett, of Hallett Place, was a connection of whom one might quite reasonably be proud. Personally he was an extremely disagreeable, morose old man who had quarrelled with all his own near kin, who had driven his daughter into a disreputable marriage to escape from his tryanny, and who had only not fallen out with his grand-niece because it was impossible to differ from one who had no mind or will of her own to defend, but socially he was everything that could be desired, and might safely count on recognition without the help of the herald.

The mansion he had just been called on to quit was of respectable antiquity; there were undeniable bits of Tudor which had been rescued from the hands of the restorer; in the little Norman church at Slipperfield there were brasses in which the family name could be faintly deciphered; there was even a cross-legged crusader, sadly battered and defaced, but still recognisable to the eye of faith as an undoubted ancestor.

A more convincing proof of the age and standing of the family was the ghost—a headless lady who was rumoured to reappear at a certain corner of the park on one night only of the year, carrying the severed member in her hand. As she chose the depth of winter for her annual manifestation, a season when few people voluntarily haunt the woods at midnight, there were not many who could substantiate the story; but a spook, unlike a creature of flesh and blood, usually finds a pretty large company ready to take it on faith and make things pleasant and easy for it.

This spectral mortgage, which was inherited with the property, gave it an undoubted air of distinction. A ghost is emphatically an aristocratic possession; nobody ever heard of a ghost in a cottage or in a suburban villa, or even in a modern flat. (The Cock Lane "audition" was a fraud and a delusion.) It condescends to nothing short of an entailed estate, and comes down with the family plate, the family pictures, the family nose and eyebrows, and the family temper.

Mary Kelynge had an unshaken belief in the spectre of Hallett Place, but as she was without pride, the knowledge only filled her with nervous fears and helped to build a dislike to her home that had grown with her years. As a little girl she had lain in her crib in the far-off nursery, and translated every howl of the wind in the chimney into the voice of that wronged lady—a martyr, it was said, to love and duty. On the brightest summer day the little girl scarcely dared skirt the corner of the wood reputed as the scene of that long-past tragedy; even when she had passed beyond the discipline of the nursery the dusk had its palpitating terrors for her, and, truth to tell, she not only looked under her bed every night, but got into it, as it were, by assault—with a spring, lest an invisible hand should pluck at her delaying foot. When she had any pocket-money she spent it on a store of night-lights, taking a comfort out of the friendly little glow that at least kept the shadows at a respectable distance. There were whole regions of the old house where she never went willingly; she was afraid by day—her uncle's stern voice sent her pulses leaping; his sarcasms, though she scarcely understood them, stabbed her; by night whole troops of fears, kept with difficulty at bay during the bright hours, battalioned themselves in her solitary room when she went with her candle there.

It takes something of a strong nature, morally as well as physically, to stand the test of a solitary and unfriended life; and when the test is applied to a girl, unless she be of exceptional health and abundant resource, she is pretty certain to break down under it.

Mary Kelynge's nature was yielding to weakness. A frown subdued her, a harsh word made a slave of her. She trembled and obeyed, and went, as it were, in fear of her life. Her cowardice used to drive the old man to a bitterer scorn, and she, knowing that he despised her, shrank the more from him.

Yet in the main he tried to be just to her—the world would have said he dealt generously by her. He did not stint her in food, or clothing, or money; he only starved her in those things a sensitive woman prizes far above these—in love and sympathy and patient understanding. Patience might have made something of her. She was dull, and she had not even the prettiness which excuses so much stupidity in the eyes of the opposite sex, but at least she was grateful, and, in a dumb, dog-like fashion, she would have worshipped him for even a careless kindness.

Her grand-uncle used to wonder sometimes, with a kind of grim irony, what he had done to deserve so obtuse a companion. He had disinherited his own daughter because she had shown too high a spirit—too impulsive a desire to please herself, and it seemed a sort of Nemesis that her place should be taken by another girl who made him a tyrant by reason of her abject submission. He used to long in secret for the grandson whose existence he had refused to recognise; but his pride would not sanction any attempts to discover the lost boy until death came within measurable distance, and that need of settling the question of his successor stared him in the face and demanded to be heard.

It was then that he summoned his solicitor, and for the first time gave permission for an inquiry to be instituted, and the lost heir discovered if possible. It was not so easy a matter as might be supposed. More than twenty-six years had elapsed since Avisia Hallett's flight, and twenty-five of these had been entirely barren of all tidings concerning her.

The legal firm did what it could. It advertised widely and largely for Avisia Hallett herself, for her son, for the man she had married under the various names he was supposed to assume, for the maid who had shared her flight from Hallett

Place. The county rang for a while with exclamations over the eccentricity of the proceeding, but the publicity brought no results. No voice proclaimed itself from any part of the world as the bearer of a clue that was worth investigation. For a year hope flickered and died, and then, in a kind of grim despair, the old man made his final terms.

The restrictions he imposed, should Mary Kelynge inherit, were singularly few. Perhaps he had learned by this time the uselessness of warring with the laws of life. She would marry, of course. The dullest woman, if she be but well dowered, has no lack of matrimonial chances—"the wind will blaw a man until her," even if "Tinto tap" be her abiding place. When the wind blew a man to Mary Kelynge he was to renounce his own name for that of Hallett—a sacrifice he would no doubt willingly make. The soured, disappointed old man took very little interest in his successor, and went, indeed, not ungladly from a world where none of his hopes had been fulfilled.

Mary Kelynge was perhaps the only person who did not consider that she was a very lucky young woman to have drawn so favourable a number in the lottery of life. With a soul never proof against alarms, her looming responsibilities filled her with dismay. She went out to meet them with an apprehension that not for an instant allowed her to forget them. She, too, thought of the lost heir; but it was with a sickening certainty that he would not come home in time to relieve her of her load.

He had always hovered more or less upon her fancy's horizon, and gradually in those monotonous solitary years at Hallett Place she had come to build up a sort of mental picture of him that came at last to have the force of a reality. Had she met him anywhere in Melchisford, or in the country lanes, she would have recognised and accepted him at once. He was big and strong, and gay and free, and not afraid. The spectral lady would have no terrors for him, and he was bold in fronting the disused rooms and dark corridors, and in exploring those hidden cupboards and recesses her quivering nerves had never allowed her to approach. Somehow he gradually came to wear the guise of a protector, a defender. She thought about him, and longed for him as continuously as the old man wished for his return; but now her grand-uncle was dead and her cousin had made no sign.

With the terrors of death added to its haunting memories, Hallett Place became insupportable to her, and she welcomed the lawyer's invitation as a refuge from all these perplexities and anxieties. When she had been only a day or two under his roof, however, some occasion called her back to the old house for an hour or two, and Hester went with her. Hester was glad of any chance that allowed her to see a little more of her companion, and a little more too of the stately home that had made a certain appeal to her imagination. With regard to Mary Kelynge, she had that curious feeling that women have about women with whom they are likely to come much in contact. A man has a far finer stock of indifference. As a rule, he can travel or share chambers with another man without troubling himself to analyse his feelings for him; but a woman in like circumstances must probe to the bottom, and know at once whether she will love or hate.

Miss Kelynge's errand was not absolutely important, perhaps, in any but feminine eyes—some question of a dress to be disinterred from a forgotten box, of some trifles to be rescued before the mansion was given over to a close-shuttered summer sleep.

Hester presently left the bedroom where the final choice was being made, and wandered down the corridor, hung with family portraits, that looked at her darkly in the gloom of the old house as faces seen confusedly in a crowd.

It was mostly the more insignificant members of the family—those to whom no particular history attached itself—that had found refuge here; but she was struck, as she had already been struck downstairs, where the finer collection was hung, with the singular survival of look in all the faces—the echoed and repeated expression, the features passed on from generation to generation, written here for all to see. This inheritance out of the past faces us every day in family life—a gesture, a walk, a tone of the voice in laughter quickens us into sudden recollection of the dead; but to see it illustrated in a long line of family portraits was a startling thing in its way. It was as if the face were not permitted to die till it ended in the newly buried man. Doubtless it would not so end if the heir could be found, and to Hester, with her curiously simple logic, it seemed a reason the more why Mary should not succeed, because she alone, out of all that long line, bore no sign of her origin in her face.

Of the canvases that had found refuge here there was one at the end of the passage, where the light from a window fell on it, that she paused to examine, instinctively recognising it as the work of a master.

It was a curious, girlish face, instinct with the family look, with a pouting mouth and dark eyes that bespoke the existence of a temper likely enough to betray itself on chance provocation. The eyes seemed to follow Hester as she went slowly back to the bedroom.

"Mary," she said (it was Hester and Mary now), "whose portrait is that at the end of the passage—a young girl with a lace scarf twisted round her head?"

Mary Kelynge looked up from the box over which she was bending, and something of the habitual scared look crept into her face.

"It is the likeness of Avisia Hallett. My uncle, I believe, brought it himself from the drawing-room when she disappeared, and hung it here with his own hands; but he hung it with its face to the wall."

"What a vindictive thing to do, and petty too!"

"Oh, he was like that, if you crossed him."

"I wonder he did not rather destroy it; it was surely a poor revenge to take on the painted face."

"I used to be so afraid," said Mary, in quite superfluous explanation, "to pass that place. It seemed as if some dead person were out there

among all the others—they used to watch it all day long; and though I was curious to see the face, I never dared to turn the canvas round. But one morning, about two years ago, when I came out of my room, it was looking at me with those angry eyes. I suppose it was my uncle who turned it—I never dared ask him."

"Poor eyes!" said Hester; "they might well look angry." "Mary," she asked, after a silence, "did you ever think of the young man—this son of Avisia Hallett?"

"Think of him?" echoed Mary, with unexpected

"No; my uncle never spoke of him to me at all. Perhaps he did not know what he was called. I call him Frank." She blushed a dullish red as she made the confession.

Hester laughed a bright laugh of glee.

"I will call him Frank too," she said; "it is a good honest name. I seem to see him better since you have christened him—a tall, brown man—"

"No; fair," said Mary.

"Very well, then, fair if you will, though I think not—it is not the family way."

"WHOSE PORTRAIT IS THAT AT THE END OF THE PASSAGE!"

energy, "I have thought of him every day of my life since I came here as a little child, and wished for him."

"You wish him to come back?"

"Yes," said Mary, in all sincerity; "but he won't," she added with despondency; "your father says so."

"Papa can't be quite sure."

"Your brother says so too."

"Andrew knows no more than anyone else," said Hester, impatiently.

"That is just the worst of it—nobody knows anything."

"Have you ever heard his name?"

"Fair, with blue eyes, and a kind of masterful way—"

"But gentle," amended Hester; "the best men are so to women and children and dumb animals; and brave and truthful as a good man is. We will have our hero so, and will pray for his return—you and I."

She felt sure now that she should like Mary, who had shown herself to have such right views. They had one belief at least which was common property—their faith in the claims of the true heir.

As they were driving home with their collected spoil in a little pony carriage, Mary, with a timid

finger, pointed to a corner of the park said to be the scene of the headless lady's lamentations.

"Do you believe in ghosts?"

Hester shook her head doubtfully.

"I can imagine some kind of ghosts," she said, "ghosts that we raise up for ourselves to haunt us. If there is any ghost at Hallett Place" —she looked at Mary with a light in her grey eyes —"it ought to be that of Avisia Hallett. Mary, if ever Hallett's comes to be yours—"

"But I don't want it to be mine," said Mary, who was a woman of one idea. "I want it to be—"

"Frank's," said Hester, again with that bright soft laugh that seemed to echo among the tree-stems and forbid sadness; "so do I."

### CHAPTER VIII.—AN UNPLEASANT ENCOUNTER.

THEIR homeward way took them close by the farm of Chalk End. Hester would have preferred to skirt this stronghold of the Mosses at a more liberal distance, but she scorned to use her knowledge of the country to take any short cut that might be construed into a desire for evasion. She had, for a woman, an exceptionally keen sense of justice and fair play. If Mary wanted to cultivate the acquaintance of the Mosses, she should not be defrauded of a single chance.

Miss Kelynge did not know her way across country as did Hester, who was used to ride with her father and brother, and sometimes to follow the hounds; but though nothing would have induced Mary to mount the pretty mare on which Hester flew light as a bird along the lanes, she knew her way to Chalk End. She was busy now with a recognition for every turn, looking out eagerly for the yard where one or other of her friends was certain to be found.

Chalk End was one of the many homes that in this part of England have fallen from a higher estate. Originally a manor and moated, with a history of respectable antiquity, it had descended with the fortunes of its owners, until upon an evil day it passed into the hands of Caleb Moss. From that hour it was doomed; Moss was not only an inadequate farmer, he was hopelessly crippled by the demands of a family of daughters, whose chief end in life was to be amused.

How many Moss girls were there? Hester was never quite certain whether in summing them up she was not including a Drinkwater, for the Drinkwaters and Mosses, cousins and neighbours, lived more or less on the communistic principle, and members of one family were always to be found on the premises of the other. Mr. Moss himself could hardly have told the number of his children. What could a man do who was overweighted with this burden of feminine incapacity? Mr. Moss decided that he could do nothing, and in doing nothing he was at least successful.

He was a weak, absent-minded creature, whose failure aroused no surprise, and perhaps no indignation. He himself scarcely resented it. He knew in a dull way that a crisis, hitherto warded off by John Mellish's good-natured liberality, was inevitable; and, since he could not avert it, his only hope was to bring it within supportable limits. A poverty that still allowed him his pipe and his home-brewed draught, his right to criticise a neighbour's crops or his beasts, was scarcely felt as an inconvenience.

The Moss girls, bereft of their young Aunt Hannah's heroic help, were content also to let things slide, and to slide with them, more or less gaily, doubtless counting on the pleasant arrest of matrimony before a too uncomfortable depth was reached. Lavy was the only one of them who resisted, but her energy could not ward off disaster.

A turn of the road brought the house in view—a long low house with that sad air of disreputability, of poverty no longer genteel, that houses may wear as well as men. A bit of ragged garden, given over as a parade-ground for cocks and hens, fenced it from the road on one side, on the other the yard crept close, and leaning on the low wall that enclosed it was Caleb Moss himself. Caleb was looking at his pigs; a great many of the hopes that had been extinguished in other directions found a resting-place in the strawyard where they disported themselves. There were scores of them—black pigs and white pigs, and pigs which impartially blended both shades in their piebald persons. Caleb would have told you with brightening eyes that pigs were cheap to feed, and grew into marketable pork without giving you any trouble. Without trouble—that was their chief merit. Except for the grunters, and a young horse rolling itself on its back with its legs in the air, the yard was untenanted.

Hester, seeing the foreground deserted, would have pulled up to have a word with the farmer. She had the sort of liking for him that one has for a man who is nobody's enemy but his own; but Caleb, notwithstanding his large experience of the sex, was shy. At sound of the wheels, and at sight of the fluttering ribbons, he ducked behind a budding lilac bush that flanked the house, happily unconscious that it quite inadequately concealed his long legs. Hester drove on with a smile; then suddenly her conscience suggested that she should pull up.

"Would you like to go in and see the girls?" she asked her companion.

Miss Kelynge hesitated, but merely out of habit. There was probably no question that could be framed that would have found her prepared with a reply. She really wished to go, and Hester, understanding this intuitively, turned the pony up a narrow lane that led to the back of the premises.

"We won't disturb Mr. Moss," she said; "he seems to find his pigs an interesting study. I suppose even pigs might repay study if one gave them enough? Why," she broke off suddenly, "there is Bess! Can papa be here, I wonder? He said nothing about it this morning."

The mare, hearing her voice, turned and whinnied to her. She was tied to the gate of what professed to be the kitchen-garden, but had lapsed into a wilderness. Hester jumped out and secured the pony safely.

"What are you doing here?" she said, stroking the arching, glossy neck.

The pretty creature looked at its mistress with

eyes that said as plainly as possible, "I love you!"

Hester's question answered itself almost as soon as it was asked. Round the corner from the house two figures appeared—a very sociable pair, it would seem, from the way in which the man's head was bent and the woman's face lifted while they talked. They were so engrossed in each other that neither of them perceived the watcher in the lane. Mary had remained seated, but Hester was tall, and could see easily over the gate.

"Andrew!" said Hester, with a wonder that had not yet had time to gather displeasure—"Andrew and Lavinia Moss!"

"Your—brother?" Mary asked, looking suddenly fluttered; "not—Mr. Hallett?"

But Hester was too absorbed to hear the question.

Lavinia was the first to become aware of her scrutiny. The colour already vivid in her cheeks deepened perhaps just a shade, but she rescued her presence of mind at once. Lavy's bold good-humour was not easily disconcerted; if she felt a moment's embarrassment before Hester's grave wonder, she was ready to laugh it off the next.

"There's your sister," she said to Andrew, "come in search of you—come to take you home."

Andrew was visibly annoyed. A man may think it no harm to flirt with a pretty girl, and yet not exactly wish to call his household to witness the process. He looked at Hester with a point-blank, resolute look which he wore when he meant to be master, and which he generally found produced subjection.

"This is a little matter in which you needn't interfere," was what it said, but the admonition was confined to looks.

"Well, Hester"—he spoke with a careless lightness—"have you come to rebuke me for appropriating Bess? You don't give her half enough to do; she was full of nonsense, and fretting her head off for a run."

"Miss Kelynge is here," said Hester, looking at the two with the dividing fence still between them. "We have been at the house, and Miss Kelynge wished to call here."

At this announcement both Andrew and Lavinia seemed to find their tongues. The little gate was opened in a twinkling, and the frightened lady in the pony-carriage greeted with a rapture that offended Hester's fastidiousness. Andrew had seen her at breakfast, yet he made as if they had but met after a separation of years. He was very solicitous to know if she was tired—if she had not felt the weather too hot or too cold, the roads too dry or too dusty. As for Miss Moss, her delight was pointed with little stings that had no pretence of being innocent.

"Well," she said, "I didn't think I was ever going to see you any more. I thought maybe you would find you had got to forget the way to Chalk End after that day you as good as sent me away, you know—or was it Mrs. Hallett who sent me away?"

"Oh, Lavy!" murmured her victim in an access of distress.

"We have not forgotten the way, you see," said Hester, with a rather haughty gravity, "and the distance between the bank and the Red House is even more easily accomplished."

"Do you mean that I'm to come over?" Lavinia demanded, with blunt directness.

"We don't keep Miss Kelynge a prisoner." Hester smiled faintly.

"Well," said Lavinia, as if she were making a heroic resolve, "I believe you do mean it. I'll come next time I'm at Aunt Mellish's. I'm not one to go where I'm not wanted, but I'll come as Mary's friend, and that needn't hurt anybody else.'

For some reason or another this resolution seemed to displease Andrew, and he was all at once in a great hurry to go home. He refused Lavinia's hospitality frankly pressed on all the party.

"You go and have a chat with father, and leave us three to have a talk."

"I have already discussed every single pig with your father," said Andrew, betraying a hint of temper, "and it is time I was home. Unless"—he turned suddenly to Miss Kelynge—"you will let me keep you company? Of course, if you wish to rest or drink tea, I'll wait with pleasure."

"I am not tired or thirsty; and, if Lavy doesn't mind—"

"Then you will let me go with you? Last night's rain has laid the dust, and I promise you Bess will be on her best behaviour if you will let us escort you."

"But you will have to go so slowly," she said, timidly.

"My pace will set itself to your pleasure," he said, stooping down to tuck in a corner of the rug that hung from the pony-carriage. "Don't refuse me," he whispered.

Miss Kelynge looked distressed—as she was sure to do at this open exhibition of gallantry. Her uncle, though it had pleased him at times to show her a sarcastic and most alarming politeness, had never paid her a compliment in his life, and in excuse for him it may be said that she was not a person to whom one would naturally say pretty things.

"Don't refuse," Andrew was saying. "It is growing late; I shall feel quite uneasy if you forbid me to keep near you."

"He's afraid somebody may want to run away with you, Mary," said Lavy, upon whom, while she talked with Hester, this little side-scene was not lost. There was a sharp note in her voice. "He wants to see you safe shut into the Red House. Oh! I knew you would be very well taken care of." Lavy's tone was growing shrill.

"Yes," said Andrew, with a good humour that was perhaps a little forced. "You are quite right, Miss Moss. I'm a lawyer, and I have the interest of Hallett Place to remember. We have lost one heir already, and we must keep a sharp eye on Miss Mary in case she should want to run off too; and where should we be then—a year hence?"

"Oh, you would find a way out of the difficulty," said Lavina, with a high-held head. "You're a Hallett yourself."

Hester looked from one face to the other while this little skirmish was going on. She did not understand it, but her finer sensitiveness shrank from it. As for Mary, she was still agitated with the novel experience of Andrew's sudden attentions. The lowering of his voice, the entreaty of his tones; never in all her arid, eventless life had any man stooped to beg a favour of her; to accept her granting of it as a grace. The heart under her bodice beat with something that was less and yet more than the usual alarm—a new sensation, vague and undefined, that kept the colour dully red in her cheeks.

Lavy's good-byes were quite effusive. She kissed Mary's blushes into a deeper hue. She would perhaps have kissed Hester too, only somehow Hester's grave eyes forbade the liberty; but for Andrew she had only a cool parting nod.

So they set out, Andrew riding by the little pony carriage and appearing to be wholly wrapped in his self-imposed task of protecting his fellow-travellers. He held himself erect, and did not once look back, though he was intensely conscious of Lavy's following glances. Hester was conscious of them too, and they disturbed her. What did it all mean? She carried away a very vivid mental picture of Lavinia—a tall, bold figure in a dress that in its pronounced fashion and colour was too bright for the tender tints of the spring which made a background for it. Lavinia, indeed, had nothing in common with the young year's hesitancies and delays, its modest reluctances—there was about her, on the contrary, a decision, an energy, a purpose, an audacity that all at once explained Miss Kelynge's subjection to her. It was the weak instinctively turning to the strong—the timid to the bold. If in the shaping of circumstances their wills and their wishes should ever clash, it was easy to prophesy on which side victory would lie.

The homeward journey was conducted for the most part in silence—an agitated silence on Mary's side. Hester's occupation with the reins allowed her to miss a good many of the small civilities with which Andrew beguiled the way; he did not say very much, but his looks were not without their significance.

"I am your protector, your defender, your cavalier," they seemed to say; "if any danger threatens, my life is at your service."

If this interpretation of Andrew's bold glances had struck Hester, she would have laughed merrily. Danger in their own green lanes! Was the age of romance, of footpads, and blunderbuses, and masks, back again? Hester's thoughts, however, were preoccupied; they were busy with that vision of Andrew and Lavinia Moss she had surprised in the neglected garden. What did it mean?

Hester, absolutely sincere herself, was no lover of mystery. When later in the day she found herself by chance alone with her brother in the drawing-room, she seized the chance to seek enlightenment. "Andrew," she said, "I didn't know you knew the Mosses so well."

"So well as what?" he questioned in his turn. "So well as to have a friendly chat with Miss Lavinia after finishing my business with her father? I should have thought our experiences in the dancing school might have helped you to that."

"It is years since we had dancing lessons together."

"It is also years since Aunt Mellish did us the honour of entering the family. Your objection to the Mosses is a little out of date, my dear."

"I don't object to the Mosses," said Hester, steadily; "I asked Lavinia to come here."

"What is it you are pleased to object to then?"

"If you wish to be friends with the Mosses—with Lavinia—wouldn't it be as well to do it openly?"

Andrew laughed good-naturedly enough; but when he spoke it was with a masterfulness that had an edge of contempt.

"My dear girl," he said, "take my advice and don't attempt to meddle with other people's affairs; you're sure to come to disaster if you do. Your own will be quite enough for you to manage, without going out of your way to take on other folks', and as a rule you'll find it safer and pleasanter to keep your advice until it is asked for."

"Andrew, you are unjust," said Hester, smarting under his contempt; "I didn't advise you—"

"Didn't you? It sounded uncommonly like it."

"You are very cruel." Hester's voice was quivering. She was shocked to find herself on the verge of serious estrangement with the brother whose comradeship had made so large a part of her life.

"Am I? Well, don't give me cause." His voice was perfectly good-natured; he did not share her agitation, because he felt sure of his own ascendency. If he had been angry too it would have been easier.

Hester rebelled and was humiliated, but she mastered herself with an effort. The need of being reconciled to Andrew surmounted her sense of injustice.

"Don't be cross," she said, pleadingly, the tears trembling in her great grey eyes; "I didn't mean to offend you."

"There, goosey," he stooped and kissed her, "does that look like being cross? Now be a good girl, and don't bother about me; I can look after myself and my friendships, as you call them. Come into the greenhouse. I want to send Miss Kelynge some flowers, to take away from the oppression of that funereal crape. Is all that gloom necessary for a grand-uncle?"

"He was her nearest relation," said Hester, doing her best to control herself and conquer her inclination to run away and cry in secret, "and he has only been dead a week."

"Well, I suppose we must yield to Mrs. Grundy. Ask her to wear these." He gave her a handful of white blossoms he had selected with some care. "That unrelieved woe takes away my appetite since I've got to sit next it."

Hester carried the offering upstairs obediently. Preoccupied as she was, her difference with Andrew still foremost in her thoughts, she could not but spare a passing wonder for Mary's recep-

tion of the flowers. It could only be explained on the ground that she had been all her life one of the snubbed people on whom nobody ever felt it an obligation to confer any attention. Nobody had ever given her flowers, or music, or boxes of sweets—those little offerings laid at the shrine of beauty.

She held the bouquet a little as if she were afraid it might burn her, and yet she did not lose her clasp of it.

"It is very kind of your brother," she stammered, "very kind."

"I daresay he thinks you miss the Hallett Place greenhouses," said Hester, indifferently.

"You must show me how to wear them, Hetty; I—I never wore any at home, uncle would have laughed."

"Let me pin them in for you," said Hester, feeling a little ashamed before this naïve confession—it spoke of such a restricted girlhood.

"And Hester, do you mind—you won't be offended? You once offered—will you do my hair? It won't come right for me—it's so wispy."

"Of course I will," said Hetty, resigning herself. It was perhaps just as well that she had no time for the contemplation of her grievance.

She conscientiously did her very best as an artist on trial for the first time, but the result was disappointing. It was hair that refused to be anything but wispy, even in skilled hands.

It is a popular theory that all young people, by virtue of their youth, are more or less pleasant to look upon, and that the wearing of flowers is a permissible addition to their attractions.

If Andrew had held this amiable doctrine as part of his creed, he renounced it from the moment Miss Kelynge entered the drawing-room. The white flowers were a sad mistake.

In the privacy of his thoughts Andrew put the matter more brutally.

"She is horribly, hopelessly plain," he said, "and she looks like a housemaid trying to be a lady."

Mary certainly appeared at her worst, and her nervous self-consciousness was not lessened by the circumstance that there were two strange young men in the drawing-room when she entered it. To Mary young men were almost as terrifying as the traditional ghost of Hallett's. When these two paused in their talk and looked at her she felt a strong impulse to turn and fly. Hester and Andrew were with them, but Andrew sauntered towards Mary when she came to a sudden halt midway in the room, and it was then that he made that uncomplimentary remark already recorded.

It was Hester's soft voice that made the introductions. She led the young men up to the shrinking girl.

"Mary," she said, "here are two old friends of ours whom you ought to know. Tom is a Melchisford man, and you have met his cousin, Dr. Rose. Mr. Somers"—she turned to the taller and darker of the two—"is one of us by adoption; we have presented him with the freedom of the town, and he is good enough to say he likes it better than London. Could there be a finer compliment than that?"

The young man's eyes said as plainly as possible that there was the best reason in the world for the preference, but she did not give him time to express it in words, for she went on:

"You must give them both a welcome, Mary, for they are our allies; they are going to help us to find Frank."

"Frank?" queried Andrew, with a sudden sharpness; "who are you talking of, Hetty?"

Tom laughed, betraying that this mild little secret had already been confided to him.

"Hester has enlisted us to join in the man hunt," he said.

"Oh! so you're going to turn amateur detective?" said Andrew, with a sneer. "Very glad of your assistance, and Miss Kelynge will be eternally grateful to you if you succeed."

"Yes, I will," said Mary, with sincerity, speaking for the first time.

The young man called Tom seemed kind, and his pleasant smiling looks disarmed the most rebellious fears. The other one—the tall dark one—was entirely occupied in looking at Hester, and had eyes for nobody else. Yet it was into Tom's arm that her hand slipped when the elders came in and dinner was announced.

"I am so glad we have you on our side, Tom," she said. "Dot wrote to me, you know, and Dot thinks you will be sure to succeed."

He laughed at this innocent belief. A needle rescued from a haystack—all the labours of Hercules were light compared with this enterprise to which Dot had urged him.

"How does one begin to find a missing man?" he asked. "The start seems the worst of it. A judicious course of novels might throw some light on the matter. Do you think if Will and I joined Mudie's for a quarter, and read all the stories based on this topic, it would help? There are enough of them, in all conscience, and one might get a hint."

"I don't know," she said, doubtfully; "it would depend on how he was lost."

"There's only one way of being lost, isn't there? But there are ever so many ways of being found. In the novels a letter is generally discovered in a secret drawer; or a tell-tale, after keeping silence for a lifetime, suddenly splits for no particular reason; or somebody has a remarkable dream, or a magician is employed. I wonder if there are any magicians left in London? If we could unearth one—"

"Tom, don't laugh," said Hester, shaking her head; "Dot is quite serious, and so am I, and you must help us."

Then there was a pause when the soup plates were being removed, and the first person to break it was Mr. Hallett.

"How did the sales go yesterday at Mark Lane, Tom?" he solemnly questioned.

"Very quiet; oats are looking up a bit, but wheat is down a shilling a quarter in the week. Maize went off slowly, but beans and peas are dull."

Could anything be more uninteresting?

# THE STORY OF THE ENGLISH SHIRES.

BY THE REV. CANON CREIGHTON PROFESSOR OF ECCLESIASTICAL HISTORY IN THE UNIVERSITY OF CAMBRIDGE.

## DERBY.

IN SHERWOOD FOREST.

IF the district contained in the county of Stafford was wild and uninhabitable in early days, still wilder was the land which lies within the Derbyshire of to-day. It was, indeed, isolated on every side. On the north lay the bleak uplands of the Peak; on the west, the forest of Needwood and Cannock Chase; on the south, the great forest of Arden; and on the east stretched the forest of Sherwood, closely followed by that of Charnwood. Only along the valley of the Trent was access possible, and it would seem that a tribe of English settlers in quest of a home rambled northwards from the Trent Valley, following the Derwent and the Dove, till they were stopped by the moorlands of the Peak. They stayed by themselves in their inhospitable home, and went by the name of the Pec-setan, or dwellers by the Peak. Their chief settlement lay in the valley of the Derwent, and they called it by the name of Northweorthig.

The Pec-setan did not long enjoy the doubtful boon of isolation, but were soon absorbed by their kindred of the west, and formed part of the great kingdom of Middle England, which was brought together by the Mercian Penda in 626. In fact, Staffordshire and Derbyshire together may be considered as the original seat of this kingdom, which afterwards was widely extended. However much its boundaries changed, the lands which make up these two shires were never severed

from one another. Ecclesiastical divisions are more permanent than civil divisions, and the modern district of Derbyshire always in old times formed part of the Mercian see of Lichfield.

We need not trace again the fortunes of the Mercian kingdom. It is enough to say that the invasion of the Danes completed its overthrow, and rendered its revival impossible. In 877 an army of the Danes entered Mercia, and took possession of the eastern part of the old kingdom. It was their conquest which drew the line of separation between Staffordshire and Derbyshire; and it was their settlement which gave the name of Derby, or Deoraby, to the old English village of Northweorthig. The name they gave, meaning "the place of the deer," shows that the village lay in the midst of a waste land where the chase of wild animals provided the chief means of subsistence. Under the Danish rule Derby became a place of greater importance, chiefly as a military centre. The Danish territory in middle England was known as the district of the Five Boroughs, because it centred round the towns of Derby, Leicester, Stamford, Nottingham, and Lincoln. The Danes did not, however, find the district round Derby very favourable for their settlements, and the traces left of their presence by the suffix *by* to the names of places are not so numerous as they are further east.

Still, Derby became a place of importance, and when the English power began to revive under the West Saxon King Alfred, his daughter Ethelfled, "the Lady of the Mercians," undertook the conquest of the Five Boroughs. Derby was the first to fall in 917, and it was not long before the Danish supremacy over middle England had disappeared. In the reorganisation that followed upon this conquest the Mercian kingdom was divided into shires, and the district round Derby represented the northern part of the original settlement of the Mercians.

The Danish invasion destroyed such signs of civilisation as the district had possessed. In the days of the Mercian kingdom Repton had shared with Tamworth the dignity of being the residence of the king, and was the seat of a great monastery which the Danes swept away. The old renown of Repton led to the building of a church in the tenth century, of which the crypt still remains, and its spiral pillars are still among the most noticeable relics of Saxon architecture. Other traces of old churches scattered along the river valleys show that in the tenth century population was steadily increasing in Derbyshire, and that the amalgamation of the Danes made the district of greater importance than before. Still, Derbyshire remained somewhat isolated amidst its forests, and after the Norman Conquest required no special measures for its reduction. The greater part of its lands was given by William the Conqueror to Henry de Ferrers, whose grandson was created Earl of Derby. But Henry built his chief castle at Tutbury, just beyond the limits of the shire. The earliest of the castle-builders in Derbyshire was William Peveril, a natural son of the king, who built a castle on a tongue of land projecting from the hill of the Peak, at a place which took the name of Castleton; and further south he guarded his domains by another castle on the hill of Bolsover. The only monastic landowner in Derbyshire at the time of the Doomsday survey was the Abbot of Burton, and the old monastic orders did not choose this district for their seat. The order of the Austin canons, who came to England in the reign of Henry I, were the first who made settlements in Derbyshire. They built their houses at Derby and Dale, also at Calle, whence they transferred themselves to Repton, which was founded anew by their efforts. But the monastic houses of Derbyshire were not of great importance, and were not of a kind to contribute much to the development of the uncleared country or the improvement of agriculture.

Derbyshire remained throughout the Middle Ages scantily peopled, save in the south. It was a land of forests; the Peak was kept well stocked with deer for the royal hunting, and fifty-four smaller forests could be counted in the rest of the shire. Its men were a race of sturdy warriors, who went forth at times to war against the Scots. Indeed, it would seem that the barrier of the Peak was considered to be the only safeguard against the Scottish raids; for the Bishop of Carlisle, who received the church of Melbourn from Henry I as part of the endowment of his see, built himself a palace there and used to hold ordinations in the church when the Scottish invasions rendered his border city an unsafe place of abode.

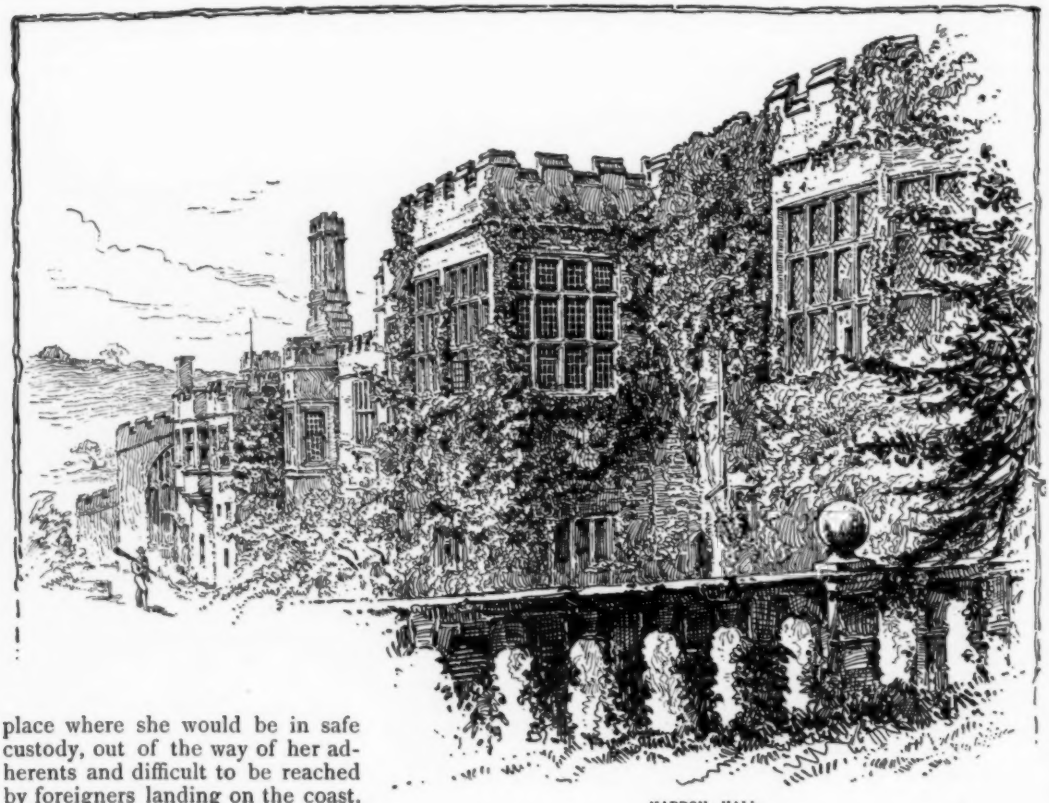
Sometimes the military prowess of the men of Derbyshire was revived in behalf of the rebellious schemes of their chief lord, the Earl of Derby. In the reign of Henry II, Robert de Ferrers was one of those who rose against the king, and a century later his descendant took advantage of the general discontent against the weak government of Henry III to try and gain something for himself. He was regarded as faithful neither to the king nor to the barons, but only strove to get royal castles into his own hands. For this he was imprisoned by Simon de Montfort in 1264, and after Simon's fall was called to account by the king. He put himself at the head of the men of Derbyshire, who gathered round their leader with the personal loyalty which comes from a secluded life; but his levies were defeated at Chesterfield. He fled into the church for refuge, and would have escaped the notice of his pursuers had not a girl, whose lover he had forced to join his troops, given a sign of his hiding-place. He was dragged forth, was taken prisoner to London, was made to pay a fine of seven years' income and surrender his castles, and finally was deprived of his earldom, which was conferred on the king's second son, Edmund, who became Earl of Lancaster, Leicester, and Derby. Thenceforth the possessions of the earldom of Derby followed the fortunes of those of Lancaster, and with the accession of Henry IV passed to the Crown.

Derbyshire did not play an important part in English history, and was not the scene of important events. Its growth came from the slow progress of agriculture, the clearing of the forests,

and the steady industry of its people. Like other parts of England, its main commerce was in wool, and Derby in the thirteenth century did a little trade in dyeing woollen cloth. The district of the Peak was known in early times to possess lead mines, which had been worked by the Romans, and a rude race of miners formed there a class of themselves. As early as 1287 they were empowered to empanel a jury which should declare their customs and draw up a rough code of laws for a settlement of their disputes. But in those days of bad roads there was little means for the development of mineral wealth, owing to the difficulty of carriage. The gradual growth of a body of country gentry during the fourteenth century, owing to the division of large estates, seems to have afforded the chief inducement to bring the land into cultivation and foster agriculture. Still, in 1377, the population of the county is only estimated at a little more than twenty-four thousand.

The great changes of the sixteenth century did not materially affect Derbyshire. The fall of the monasteries made perhaps less difference than in any other part of England, and did not much change the habits of the people. But new ideas did not rapidly penetrate into Derbyshire. Many of the old families remained firm in their allegiance to the old form of religion. The wild

PEVERIL CASTLE.



district of the Peak afforded a natural refuge to those who, in the reign of Elizabeth, fled from the penal laws directed against the Roman Catholics. From time to time raids were made upon the recusants, and Derby Gaol was frequently full of prisoners whose only crime was that they remained true to the opinions of their fathers.

The sixteenth century was a time of the growth of new families who added field to field and gained in wealth and position. The old nobility passed away, and a new nobility took their place. Those of the old nobles who still remained were obliged to fit themselves into the new state of things. There is no more conspicuous instance of the change which came over England than is the history of George Talbot, sixth Earl of Shrewsbury. His possessions lay in Derbyshire and the neighbouring shires. His chief seat was at Sheffield; but he held on lease from the Crown the Manor of Wingfield and the Hall of Buxton in Derbyshire, the manor of Worksop and the abbey of Rufford in Nottinghamshire, and the castle of Tutbury in Staffordshire. All those outlying possessions were on the borders of Derbyshire, which was thus the centre of his greatness. He further increased his estates by marrying for his second wife a great Derbyshire heiress, who had increased her fortunes by a series of marriages. Elizabeth Hardwick, heiress of Hardwick Hall, near Chesterfield, belonged to the class of the smaller gentry and raised herself to a high position by her numerous marriages. At the age of twelve she married a neighbouring squire, and was a widow at thirteen—having inherited from her husband. She was then an eligible match, and married a Suffolk knight, Sir William Cavendish, by whom she had a large family. At the age of thirty-seven she was again a widow, and married a still wealthier knight, who left her his sole heir. At the age of forty-eight she could add rank to her wealth by marrying the Earl of Shrewsbury, to whom she brought two other houses in Derbyshire, Hardwick and Chatsworth. As a condition of her marriage she demanded that her eldest son, Henry Cavendish, should marry one of the Earl of Shrewsbury's daughters. He, however, died without issue, and her second son, William, succeeded to her possessions and those of his elder brother. He was very wealthy, and in 1618 bought the title of Earl of Devonshire from James I for £10,000, and was the founder of the great family which has its seat at Chatsworth—a house on which Elizabeth Hardwick is said to have spent £80,000.

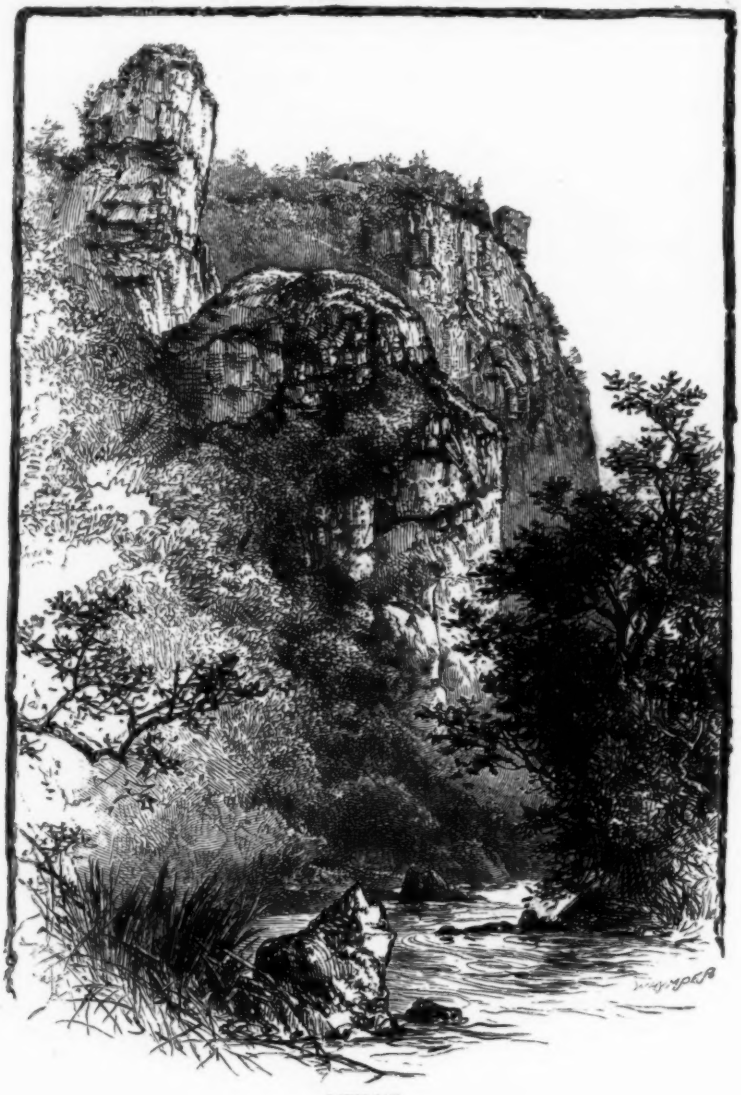
Though this worthy lady's schemes prospered in the long run, they did not add to her happiness or that of her husband in the immediate present. Queen Elizabeth was a far-sighted ruler, and knew how to

make her nobles useful. The very fact that the Earl of Shrewsbury was possessed of so many houses in the middle of England suggested a way in which he might be employed. When Mary Queen of Scots took refuge in England she caused great embarrassment to Elizabeth. It was not safe to let her go, and it was not decent to make her a prisoner. It was hard to find a place where she would be in safe custody, out of the way of her adherents and difficult to be reached by foreigners landing on the coast. The Earl of Shrewsbury, with his many houses, all in sure places which could be easily guarded against surprise, was obviously the man for Elizabeth's purpose. Mary Queen of Scots was committed to his charge, and for fifteen years one of the greatest nobles in England was saddled against his will with the duties of a gaoler. Tutbury, Wingfield, Chatsworth, Sheffield Castle, and Sheffield Lodge were in turns the prisons in which Mary was confined. The Earl of Shrewsbury was carefully watched by the suspicious Queen Elizabeth, and if he absented himself for a day without permission was sharply reprimanded. His wife alternately interfered in behalf of Mary and was jealous of her. Shrewsbury, heartily striving to do his duty to Elizabeth, was exposed to continual annoyance from these suspicious women, and experienced no gratitude. He was at last one of the commissioners appointed to try Queen Mary, and was further sent to superintend her execution. He died in 1590, worn out before his time by the troubles which he had undergone.

The Cavendish family, however, prospered, and its members became the natural chiefs of Derbyshire. The charms of the country as a place of residence were discovered, and its delightful dales were gradually filled with interesting houses. The Hall of Hardwick was enlarged, and remains as an excellent sample of an Elizabethan house. Haddon Hall, which was begun in 1420, when the castle was giving way to the manor house, received its present shape in the middle of the next century, and still tells us of the new spirit of mingled dignity and comfort which marked the sixteenth century. Men felt that country life was an enjoyable thing. They lived on their estates; they interested themselves in local governments; they were keen to develop the full value of their lands. Derbyshire, which had been behind the rest of England in the civilisation which sprung from monks and feudal lords, rapidly rose under the influence of the gentry. It is true that the Peakland was left for some time in its isolation, but the rest of the county grew and prospered.

HADDON HALL.

At the beginning of the great Civil War Derbyshire lay on the dividing line between the Royalist and Parliamentarian districts. In fact, throughout its history it was doubtful if Derbyshire belonged to northern or southern England. At first Charles I marched to Derby in 1642, and seemed to claim the allegiance of the county for himself. But Sir



John Gell challenged this claim on the Parliamentary side, and though Derbyshire was not the scene of any great battle, it was disturbed by perpetual skirmishes and sieges. For a time the two parties were equally balanced, but Sir John Gell slowly won his way. Many of the fortified houses in the county were at this time reduced to ruins. Chief amongst them in picturesque interest at present is the manor house of South Winfield, one of the houses of the Earl of Shrewsbury, and one of the prisons of Queen Mary. First it was garrisoned by Gell, then it was taken by the Royalists; again Gell attacked it, and its governor was killed in the storm. Finally it was dismantled by order of Parliament in 1646, and fell into the ruins which may still be seen. The fortunes of the castles of Welbeck, Bolsover, and Tickhill were all similar, and many other strong places disappeared. In fact, the Civil War was as important in the social history of England as was the dissolution of the monasteries. The one swept away the houses of the monks, which had grown out of all proportion to the needs of the country; the other swept away the strongholds which were likely to give the country gentry an undue power in the state. It destroyed the last semblance of military importance, and left England frankly an agricultural and industrial country.

Only once again was Derbyshire disturbed by the din of arms. In 1745 Prince Charles Edward Stuart undertook his ill-fated expedition into England, and marched with his Highland supporters towards London. He reached Manchester at the end of November, and by a pretence of marching upon Lichfield drew the Duke of Cumberland, who was guarding the road to London, to leave his position at Newcastle-under-Lyne. Then the Prince suddenly altered his march and passed through Leek and Ashburn to Derby, which he reached on December 5. The Highlanders were eager for battle, and thronged to the cutlers' shops to sharpen their broadswords. But their leaders were disappointed at the small signs of popular enthusiasm which were awakened by their presence. The people were interested and curious; they thronged to look at the Highlanders, and talked with them in a friendly way, but they did not join in their enterprise. Only three recruits were gained in Derby. The Prince was anxious to push on towards London, but his generals were doubtful. The Duke of Cumberland, they argued, would make his way southward, and could meet them before they could reach London. Supposing they conquered in the fight, they would find another army on Finchley Common, drawn up for the defence of London, and they feared to fight a second battle with diminished numbers. If they were overcome the country people would at once

BOLSOVER CASTLE.

rise against them, and not one of the fugitives would escape alive. They had trusted to a rising of the English people, or to the effects of a sudden panic. As their expectations had been disappointed there was no course open save a retreat. By such

DOVEDALE.

reasoning the Prince was overborne, sorely against his will, and on December 6 the Scottish army left Derby, and began to retrace their steps homewards. The spirit of Charles Edward was broken by this failure, and the field of Culloden saw the overthrow of all his hopes. So far as England was concerned, his march to Derby had been little else than a pageant.

Meanwhile, Derbyshire was advancing in industry. The lead mines of the Peak were worked with better effect, though the methods of mining were very rude before the discovery of the steam-engine. The miners made their way into the mine by narrow openings, down which they slid, and up which they dragged with difficulty the ore which they had won. They were clad in leather and wore leathern caps to protect them as much as possible against the knocks to which they were exposed. They were a rough people, semi-barbarous in their manner of life, and living apart from the agricultural folk around. But in the south of the county Derby became the seat of an important industry—the weaving of silk. The reign of Charles II was a time of great growth of luxury in England. Woollen cloth had hitherto been the material of which English dress was made; but the taste sprung up for silks, which were imported partly from France and partly from India. The weaving trade consequently suffered

great depression, till an attempt was made to weave silken fabrics in England. The most successful of these endeavours was that of Thomas Lombe, who in 1717 erected a silk mill at Derby, which rapidly prospered, and round it grew up a trade of weaving silk stockings. When machinery was invented, the water-power supplied by the rapid streams of the Derbyshire valleys made them favourable places for industry. Thus, when Arkwright had finished the invention of the spinning-frame, he went into partnership with Strutt, of Derby, and they set up their works at Cromford, in a valley near the Derwent, where was a spring of warm water, which prevented the neighbouring stream from freezing, even in the severest winter. The industrial growth of Derbyshire has steadily progressed, without, however, reaching such a height as to interfere with the natural beauty of the country.

Thus Derbyshire remains with many charms. Its distinctive features, its dales, and streams, and moorlands, are those which in early days made it savage and wild, and kept it apart from the rest of England. Now they attract the tourist, who is further taught to see in the great historic houses for which Derby is famous the means whereby the niggard gifts of nature were developed into a source of wealth; and the charm which comes from the sense of human care adds a grace of its own. It is the valleys of the central part of the county, the great houses of Chatsworth and Haddon Hall, and the natural curiosities of the Peak, which make Derbyshire a place of resort to the dwellers in the manufacturing districts by which it is surrounded. The varied industries of the rest of the county are allied to those of the neighbouring shires. Derbyshire is exceptionally fortunate in the happy mixture which it presents of natural beauty, historic memories, and varied industrial activity. Within a short distance it is possible to turn to almost all the sources of England's greatness.

## London Twilight.

THE winter day is fading fast,
A day of bitter wind and sleet;
And dreaming of a brighter past
I sit and gaze across the street.

A little girl with sunny hair
Stands looking through the window pane,
And sees a future May-time fair,
With clearer skies and softer rain.

My heart goes backward, miles and miles,
To gather withered leaves and flowers,
But on her hopeful fancy smiles
The bright new green of summer bowers.

Her trusting glances, never dim,
Pierce swiftly through the twilight haze,
And meet the tender face of Him
Whose love is watching both our ways.

Ah, little girl, across the street
My spirit flies to learn of thine!
Thy childish faith, so calm and sweet,
Is wiser than all thoughts of mine.

For hope is better than regret,
And One who loves us both may be
Waiting beside still waters yet
In pastures green to welcome me.

SARAH DOUDNEY.

# THE SOVEREIGNS OF EUROPE.

## THE EMPEROR OF AUSTRIA.

THE EMPEROR OF AUSTRIA.

[*From a Photograph by Kollar Károly.*

IN the placid provincial garrison town of Olmütz, in Moravia, not far from the dreaded fortress of Spielberg, made for ever famous in Silvio Pellico's narrative, there reigned, in the early winter of 1848, a most unusual excitement.

For it was here that the Emperor Ferdinand, all the Imperial family, the Court, and the high dignitaries of Austria had suddenly pitched their tents after their ignominious flight from Vienna, at that time in the hands of an insurgent populace, who loudly clamoured for a constitution to replace the traditionary Austrian autocratic Government.

It is true that after a stout resistance the capital was at length retaken; but it was evident to all concerned that the inhabitants had only yielded to overwhelming force, and that discontent with the tyrannical Prime Minister, Prince Metternich, and with the amiable but weak-minded Sovereign Ferdinand, was therewith by no means allayed. The assemblage of nations over which the Hapsburgs ruled seemed to have grown tired of them.

Long and serious and secret were the discussions held on this subject in the bosom of the Imperial family. They had begun in those dreadful March days, the days that saw the dismissal and hasty departure of Prince Metternich, who had to seek refuge on hospitable English soil to escape from the hands of those who hated him throughout the length and breadth of Europe. These March days put an end for ever to the famous "system," a gust of storm wind had carried it away. New men, young men, were required for the new situation; since the 13th of that dreadful month it had pretty well been decided in private Imperial conclave that the eldest son of Archduke Charles Francis should succeed his uncle. But of this decision only about six people knew, and among these was neither the young Archduke himself nor Metternich, for forty years the repository of all State secrets.

In a letter addressed to him in London, Archduchess Sophia, mother of Francis Joseph, says (March 23, 1848):

"Poor Franzi was my one consolation in our distress. In the midst of our troubles I blessed heaven for having given him to me such as he is! His courage, his firmness, his downright mode of thought and action might almost give us hopes that God will yet open up a future for him, since He has gifted him with the necessary qualities."

We catch in this letter an echo of the intimate conversations held at this time in the Vienna Hofburg. The old Chancellor's reply to the Archduchess's letter is worthy of note. Once again he explains his policy, but at the same time condemns all political systems, and makes this strange avowal: "I was born a socialist, in the

true sense of the word: I have always looked on politics as a luxury compared with social dangers, and it is not my fault if I have received but little support in the direction which my mind follows, and which my actions have followed."

Prince Metternich, Chancellor of his Apostolic Majesty, a socialist! It was, indeed, well for him that he had passed the Austrian frontier ere proclaiming such opinions, or the police might have made it hot for him. Still, no doubt, there was a notable difference between Prince Metternich's socialism and that of Proudhon. However that may be, the old Chancellor had not been informed of the abdication ideas of the Emperor Ferdinand. Besides, it was urged, by the few persons in the secret, that the time for carrying them into effect had not yet come. It was needful still to pass through all the various phases of that terrible year before the moment seemed ripe.

One morning—it was December 2, 1848, a dismal winter's day—the unwonted movement in the streets of Olmütz appeared yet greater than before. Since seven o'clock, when it was barely daylight, carriages and coaches of all kinds had been rumbling over the paving stones towards the Episcopal Palace, where the fugitives lodged—vehicles that contained ministers, ambassadors, court dignitaries in gala dress. The streets were patrolled by regiments in full-dress uniform, bearing in their shakos a branch of greenery, always a sign of rejoicing in the Austrian army. There could be neither ball nor banquet at this early hour. What did it all mean? asked the wondering inhabitants. Nor could the dignitaries themselves, when interrogated, reply. They could only point to a letter summoning them to appear in gala at eight o'clock precisely in the Episcopal Throne Room. Here they saw nothing but a heavy daïs, beneath which stood two arm-chairs embroidered with the Hapsburg arms, and at their feet a black wooden chair and a little table strewn with papers. A young man, afterwards the famous Baron Hübner, stood beside it, trying quill pens and making order among the documents.

What was this mystery? Even the nearest relations of the Emperor were in ignorance. Not a soul except the initiated even suspected the truth.

"What are we doing here?" asked one of the Archdukes of the Minister of War.

"Your Highness will learn in a moment," was the cautious reply.

And indeed while he spoke the great doors that led to the private apartments were thrown wide open, and there entered, with all State pomp, the Emperor, the Empress, the eldest brother and sister-in-law, the nephews and State functionaries, many in number. A close observer might have remarked that the eldest nephew, a tall lad just eighteen, looking even more elegant than usual in his uniform as colonel of dragoons, had a face of extreme pallor that morning. Ferdinand, too, looked agitated; but he had long been ailing, and late events had been too much for his slender strength.

The Sovereigns took their seat, the Archdukes and duchesses grouped around them. Prince Schwarzenberg now advanced, and put into the Emperor's hands a sealed packet. Ferdinand broke it with a trembling hand, and then read, in a low but firm and distinct voice, a brief decisive declaration, to the effect that he had taken the irrevocable decision of renouncing the crown in favour of his well-beloved nephew, his Serene Highness the Archduke Francis Joseph.

It was done. The veil of the great mystery, so carefully shielded for seven long months, had fallen. But never had secret been so well kept. Intense surprise greeted the short address.

There now followed various formalities, among them the renunciation of all rights to the throne by the Archduke Francis Charles, the young heir's father, who had the first right to succeed his childless brother, but who, weak even and more easy-going than his brother, was still less fitted to guide the reins of the Austrian State at a difficult moment of its history. Nor could anything have rendered this kindly, simple person more miserable than the idea of being forced to give up his quiet burgher existence.

All the great personages present now signed the charter that recorded the solemn deed. Then the new Emperor, tears in his eyes, knelt down at the feet of Ferdinand, as though to implore his blessing and his pardon for taking his place. Soon after, the family quitted the Throne Room, and the new-made Emperor at once mounted his horse to review the troops drawn up outside. Thus he inaugurated his career as Sovereign.

Meanwhile the late Emperor and Empress set out in a modest travelling carriage for Prague, where, beloved by all their surroundings, they lived quietly and happily until their death. Ferdinand resigned the crown at the age of fifty-five, the same at which his great ancestor Charles v retired to the Convent of St. Just.

On the day following the ceremony of abdication, Ferdinand's successor had to receive a deputation from the Parliament which was then sitting at Kremsier, and reply to the welcoming speech of the president, the Polish Dr. Smolka, who still holds that office. It appears that the speech which he then made at Olmütz was very long. The young Emperor listened without flinching, but showed emotion in his reply. His voice trembled, he had difficulty in finding his words. However, little by little, he gained assurance, and the end of his speech was given with firmness and energy. In a moment this Sovereign of eighteen had taken definite possession of his throne; hardly on the throne he had begun to reign, and for forty years he has continued so to do.

On the same 3rd December the accession of the Emperor Joseph was solemnly proclaimed with sound of trumpet in all the cities of the Empire that were not in the hands of the Revolution. Strange indeed does it sound in our day of telegraphs to learn that the news took thirty-six hours to reach Vienna. The people greeted the tidings with cries of "Long live Francis Joseph I, the constitutional Emperor!" thus with

one word striking the keynote of the whole situation.

Truly the task set before this newly-made Emperor of eighteen was no sinecure. The crown of Austria, one of the finest on earth, had been easy to wear until the days of March, 1848; till then a word, a look, had been a command to forty million faithful souls. Now all was different. Francis Joseph did not take this light crown upon his head. He was called on to rule a dissatisfied people, a people that could no longer be kept down either gently or forcibly; a people that claimed its human rights, its privileges to choose its governors, and to be ruled in accordance with more modern views. Well might he say, "Farewell, my youth!" as he took on his shoulders the burdens of such a government.

LITTLE FRANCIS JOSEPH AND THE SENTRY.

And this youth would have been a tranquilly happy one, well suited to the eminently retiring nature of the man. Francis Joseph was born, August 18, 1830, at Laxenburg, some nine miles to the south of Vienna, in an Imperial residence which Francis I, inspired by reminiscences of Sir Walter Scott and Anne Ratcliffe, had built strictly on the lines of a baronial castle of the middle ages. Conscientious imitation even went so far as to instal in a tower a figure which, by means of a spring, rattled its chains and uttered plaintive sounds. Franzi, as he was called by his family, was his grandfather's great pet. Like the young Duke of Reichstadt, he too played for hours in the monarch's cabinet, while the latter was busy with State affairs, which he sometimes interrupted to have a hearty romp with the little boy.

A scene out of this childhood was painted by Peter Fendi, and hangs to this day in the Imperial apartments. It was Franzi's fourth birthday, and he was happily playing in the gardens of Laxenburg, in company with grandpapa, Francis I, with the new toys the day had brought. By chance his eye fell on a soldier keeping guard. The child looked at him fixedly, and stopped his play. Suddenly the little Prince asked,

"Is it not true, grandpapa, that this sentry is very poor?"

"Why do you think that, my child?'

"Because he has to go on duty."

"My child," replied the Emperor, "everyone, rich or poor, has to go on his duty. Princes, too, must take their turn. But this man is poor. Go and give him this bank-note."

The Prince needed no second bidding. He ran up to the soldier on duty, and, holding out the bank-note, said joyfully, "Here, poor man, my grandfather sends you this."

The orders to sentries are stringent; the soldier shook his head to show that he could not take it. Prince Franzi put his finger in his mouth in great disappointment, and looked from his grandfather to the soldier and back again. The old Emperor enjoyed the scene.

"Run along, Franzi, and put it in his cartouch box."

But, alas! it was too high up, so the Emperor came near, and, lifting up his grandson, with the assistance of the Empress, they managed between them to drop the bank-note into the cartouch box.

"Now the soldier will be no longer poor, grandpapa!" said the child, delighted with his first deed of charity.

When Franzi was five, death deprived him of this grandfatherly petting. At six years of age his serious education began, shared later by his three brothers, the unfortunate Emperor Maximilian of Mexico, and the Archdukes Charles Louis and Louis Victor. The mother, a Bavarian Princess, of virile intelligence and noble soul, herself superintended the children's bringing up.

The principles on which the Austrian Archdukes are all educated was laid down as a family law by the wise Emperor Joseph II. His words run: "Every burgher can say that if his son turns out well he will prove useful to the

State, and if he turns out badly he can do it no harm, since he will get no post or office. An Archduke, a royal heir, however, is not in that position. As he will one day hold the highest office, that of ruler of a State, it is no longer a question whether he will turn out well; but he must turn out well, because every detail of business which he does not learn sufficiently, concerning which he does not imbibe sound views, and towards whose execution his body and soul are not tempered, is baneful and hurtful to the general weal."

In the choice of tutors for the young Prince the mother had been careful rather that they should be good Roman Catholics than well instructed in their various branches of tuition. The result was that the Emperor and his brother Maximilian regretted in after years that much of their instruction, especially in the departments of physics and history, was so inadequate that only later private study enabled them to make up the lacunæ in the latter study, which is of such importance to royalty. Everything that had artistic bearing was also too much neglected; and yet it was just for this that Prince Francis Joseph had the most pronounced taste, as his sketches made during a trip to Italy prove. He had also a great liking for the natural sciences, such as chemistry and botany, but none of these tastes were much encouraged.

In languages, however, the Prince received excellent instruction. At an early age he could speak and read fluently the eight languages which are used in the polyglot Austrian Empire, to which, of course, French and the classical languages had afterwards to be added.

These royal children were subjected to a stern discipline—too stern, perhaps—leaving little room for play and innocent recreation. It crushed the joyousness of youth out of at least one of them. Prince Franzi is described at thirteen as a silent lad, reticent almost to brusqueness, and painfully shy. He was nervous, too, and so fearful, for example, of horses, that he wept bitter tears each time he had to bestride one. For his military studies he at first showed neither aptitude nor inclination. Fortunately his military tutor was a man of rare and real ability, who had not been chosen merely for his unimpeachable orthodoxy. Colonel Hauslab elaborated a most careful plan of instruction, by which the young Archduke had to serve in the same way as all other recruits in each branch of the service; his theory being that he who would command must also know all the minutest details of the services.

And the colonel was successful with his pupil, only, unfortunately, this plan required time to carry it out, and the events of 1848 intervened ere the scheme was completed. Had it been accomplished, who can tell whether the course of events might not have taken a different turn in 1859 and 1866?

When the Imperial scholar had attained the age of sixteen a tutor of a different stamp was given him. He was neither priest nor soldier, and yet the wiliest plotter, the greatest strategist contemporary Europe knew, for it was Prince Metternich who was to initiate him into diplomatic business, though circumstances, the pressure of public opinion, and awakened national self-consciousness, never permitted the Emperor to put into practice the lessons received.

In 1847 the Archduke Francis Joseph made his first appearance in public as the Emperor's deputy to instal the Governor of Pesth. The national Magyar movement in Hungary was then in its first fever heat of excitement, and patriots attached special value to the use of the Hungarian language in official acts, instead of German or Latin, till then employed. But no Archduke had hitherto taken the trouble to learn their speech. What was their joy, then, when Francis Joseph addressed them in purest Magyar! They sprang from their seats, they shouted "Eljen!" till they were hoarse, they drew their swords and swung them after traditional Hungarian fashion as a sign of joy. And when, some months later, Hungary was in full revolt against the Emperor, a deputy arose, and, reminding the assembly of the young Archduke who had enchanted Magyar hearts by his Magyar speech, proposed that this youth should be elected future King of Hungary.

The deputy who made this speech, which was applauded to the echo, was no other than Lajos Kossuth. And the speech found an echo in Austrian breasts during the March days of '48, with the result that, while the rest of the Imperial family were often publicly insulted, the young Archduke met with respect everywhere.

Thus trained, and under such auspices, Arch duke Francis Joseph ascended the throne, a sober lad, who was aware to the full of the greatness of his responsibilities. This is proved by the motto he chose for his own. It runs, "Viribus unitis," for he recognised that it needed all-united forces to weld again into a whole this distracted, discontented, heterogeneous Austrian Empire. The old decaying Austria had to die, it was no longer suited to its time; but a new strong sapling must spring from the ancient trunk, and to see that this should come about was the Emperor's duty.

And he soon showed himself not only strong and disposed to rule with a high hand, but also genial and lovable. Thus the people were pleased that on his accession he assumed his two names, Francis and Joseph, reminding the nation of its two most popular monarchs, Joseph II, whose memory lives unweakened in his people's hearts, and who believed that only under another Joseph could Austria once more be happy; and Franz, the husband of Maria Theresa, the people's friend, who, for all his misfortunes and losses, had yet made Austria great. It is true that some wise-acres shook their heads over this decision, regarding it as a weak and almost despairing bid for popularity.

It was some months ere Francis Joseph could enter his capital, which had been seized and sacked. When he did arrive it was silently and almost incognito. He took up his residence at once in the castle of Schönbrunn, famous for its memories of Maria Theresa, of Marie Antoinette, of Napoleon, and the Duke of Reichstadt. When the news leaked out it spread like wildfire, and all

the Viennese, that essentially pleasure-loving folk, were anxious to see the new Emperor of eighteen, whose portrait they had often beheld, but of whose person they had taken very little notice as he rode among his brothers in the leafy Prater.

But Francis Joseph made these pleasure-lovers understand from the first that his motto was business, not enjoyment, and all his reign long he has accorded them few of those occasions for public festivities which are dear to their hearts as life's blood.

He set to work immediately, and indeed there was much to put in order, for the kingdom was all in pieces, and even sections of the army proved disloyal. Winter and summer, at five daily did the Emperor leave his couch in the first years of his reign, using the early hours to continue his studies. Then he worked, held audiences, received ministers. A short walk, a rapid ride, and a visit to the theatre were his only recreations. He threw himself with ardour into his duties, surprising his ministers by his industry and energy.

"For matters of business," said Prince Schwarzenberg, "I can always gain admission to the Emperor, no matter what the hour may be."

It is difficult to realise nowadays the peculiarly difficult task that awaited Francis Joseph; and Ferdinand was right when, descending from the throne, he said, "Austria needs a young, robust monarch." It needed all the physical strength and elasticity of youth to cope with the problems presented to Austria's Emperor, and it is greatly to Francis Joseph's credit that he has, on the whole, acquitted himself so well of his most thorny task, a result largely due to his personal character. There is perhaps no European country where the problems of government are so difficult as in Austria, and in some respects they have grown even more difficult of late years. The personal responsibility of the sovereign is greater than ever. The Emperor has not only to tread the well-marked path prescribed by duty and by law for a constitutional monarch. He has to exercise, as an individual, a regulating, moderating, and dominating influence over the two co-equal sovereignties of the Cisleithan and Transleithan States, complicated in each case by the recognised or unrecognised pretensions of races struggling for "autonomy," and drifting into "Parliamentarism." Anxious and laborious duties these, since the position of the Empire in Europe and the character of its component parts cause its very existence to depend on internal unity and diplomatic skill.

A stern task, a complex problem truly; and, though no doubt he made mistakes, being but mortal, on the whole the world will agree that Francis Joseph apprehended it in all its sternness. He saw that the position of his country was probably unique in Europe, and that Parliamentarism, Constitutionalism, were terms that must be changed and modified according to the nature and idiosyncrasies of his widely differing subjects. Adaptability and self-effacement were the two great characteristics these circumstances required from him, and rigidly did Francis Joseph carry them out in his own person. The result is that at this day the true personal character of the Austrian sovereign is what no one, not even a diplomatist, professes to understand. Indeed, diplomatists frankly admit that his character perplexes them, and his own ministers do not profess to understand it. He has managed to escape the Argus eyes of even the newspaper special correspondents; no one has ever attempted seriously to analyse his character. Actual as well as nominal master of eighteen European States, the image of the man himself stands in shadow, so far hidden in the gloom as to be personally unrecognisable, and this by his own voluntary wish and will.

And yet he is no mere lay figure; those who think this are greatly mistaken. Doubtless he is not a great man of the first category, for in that case he could not have smothered his individuality, no matter how hard he tried. But neither is he a small one, for self-repression and self-effacement at the command of duty are not the gifts of petty natures. The smaller a nature the more self-satisfied, the more filled with an idea of its own importance.

Comte Paul Vasili has no doubt well grasped the situation when he writes as follows: "For the sake of his people he sacrificed all his tastes. Born to govern brilliantly, he loved the pomp of courts, show, fine armies. He would have liked in great wars to have himself led the charges at the head of a brilliant staff. Political circumstances forced him to become a constitutional king in a Federal Empire, while defeat doubly wounded his national pride.

"Then, with an adaptability which has often been taken for indecision, he renounced personal power; not, however, without sorrow and a sharp struggle with himself. All that he had looked forward to was crumbling away. Instead of being the successor of Maria Theresa, of carrying out the traditional policy, he had to content himself with a Constitutional Monarchy, under which the ministers are responsible, to become a mere bureaucrat without initiative. He accepted the position as a duty. From five o'clock in the morning on, the Emperor signs the documents placed before him; he discusses them with his ministers, but without animation. He reads a few newspapers, and runs through a *revue de la presse*, compiled daily for his use at the office of the Cisleithan Press, which keeps him informed of the exigencies of public opinion, always paternally taken into account by him. He is also very popular at Vienna, as in the different Austrian provinces. The Emperor goes to bed early, and his sobriety is proverbial. He takes his breakfast hurriedly at a corner of his desk.

"He never oversteps the privileges which he has accepted. It is only at the chase that he becomes himself, free to exert his energy and strength, employing his strategy against an innocent quarry, following it up till conquered.

"Occasionally, as in the coronation at Pesth, his nature shows itself. The Hungarians, who are so magnificent, so regal, so proud of their *fêtes*, saw how grand a figure the Emperor Francis Joseph might cut.

"Austria is full of contradictions, and the Emperor is the victim. The countries bordering on the east, which require show, with the Poles, the Hungarians, the Slavs, the very town of Vienna, which adores *fêtes*, elegance, luxury, are not satisfied with the Emperor. They would like him to be more personal, more representative, more of an Emperor; and at the same time these small peoples, tied to tradition, to their customs, with a horror of centralisation, unwilling to be governed uniformly, are irritated at the least pressure from the State. Now, the Austro-Hungarian State can only be represented by the Emperor, since the only bond of union between interests of the different provinces is centred in the dynasty of the Hapsburgs; and since 1848—especially since 1867—all direct power is refused to him from whom they expect the exercise of direct power. The Parliamentary system has never been accepted in Austro-Hungary; there is no longer room for a Cæsar. We must be logical, and give Francis Joseph credit for not having resisted the modern current; but, at the same time, we must not find fault with him for having withdrawn himself from the crowd, and for remaining the vague symbol which his people insist on his being.

"All who approach him recognise that Francis Joseph is a good man. He is charitable, but he exercises his charity as discreetly as he governs. He leaves his left hand in ignorance of what his right hand does. How can the crowd be expected to appreciate benefits whose origin is concealed when it has so little gratitude for known benefactors? . . .

"The circumstances which we have described have detached Francis Joseph from the personal interest which he would have taken in politics had he governed absolutely. Military questions alone animate him; he follows them with the greatest solicitude. A scrupulously constitutional monarch in all things, he has, however, refused to surrender the army to the hazards of Parliamentarism. Outside the army Francis Joseph's opinion is that which predominates in his kingdom. This explains the shufflings which have characterised his reign. . . .

"He is, in short, what he has described himself, if the saying attributed to him by Count Andrassy be correct: 'I am thankful that those who have been condemned to death for treason have not all been executed, for I afterwards was able to make them my prime ministers.'"

Indeed it is this impassibility that is the source and secret of Francis Joseph's strength, and explains the apparent riddle of his character. Neither as a young man nor as an old one has he ever been carried away by emotion, and he has that rare gift, that even Prince Bismarck might envy, he knows how to wait, to wait calmly and with dignity. Some men in his position stand revealed by their history, but, as has been well remarked, the history of Francis Joseph baffles ordinary comprehension by its unexpectedness. He has been the unluckiest of sovereigns, and one of the most successful; the most detested and the best obeyed. Indeed, after forty-one years of reign, it is worthy of note that defeat, against which few dynastic reputations can stand, has been powerless to affect the regard of his subjects for Francis Joseph. Their loyalty has become only the more sympathetic. A note of tenderness has been infused into it.

The fact probably is, that Francis Joseph was originally a proud and rather headstrong man, not cruel, but indifferent to suffering, and intent, like most of his predecessors, on attaining his will by force. Called to fill the throne in a difficult juncture of European history, he understood that his absolute instincts must be restrained, and that his haughtiness—the haughtiness of this semi-Spanish house, which claims to represent Charlemagne—must be controlled and take a new direction. He had to think, above all, of the great heritage entrusted to him by his ancestors, and to see that this, at all events, was not diminished. Forty years of terribly severe training have made of Francis Joseph as accomplished a diplomatist as his powers will permit him to be. These powers do not allow him to see far, or to recognise facts needing imagination to reveal them, or to appeal to masses of men with immediate success, but within these limitations they are really great. No wise person will hastily say that the Emperor of Austria is unwise; and yet he has committed actions that would admit of that interpretation.

An authoritative person has pointed out that from the day when, as a boy of eighteen, Francis Joseph was ordered by the family council to dethrone his uncle, since otherwise all hope for the House was lost, down to the present moment, he has never succeeded in any great undertaking, and yet he is ten times as powerful, as popular, and as much respected as he was then. Beaten in battle after battle, flung out of kingdom after kingdom, tricked successively by Frenchman, Italian, and German, his vast army follows him with hearty obedience; he has gained, not lost, in European position, and there is not a diplomatist in the world who, when Austria wants anything, has not a secret doubt whether, in the end, Austria will not be found tranquilly enjoying the secure possession of the object which seemed so unattainable. With half his dominions in insurrection in 1848, the Emperor was in 1850 their absolute and rather cruel lord. Beaten in 1860 by France; beaten in 1866 by Russia; driven in the former year out of Lombardy, and in the latter out of Germany; obliged, in 1848, to beg alms from Russia, and in 1867 to yield to the Magyars, he sits, in 1889, as great a monarch as ever, with as many subjects, a greater army, larger revenues, and a far more secure position, the first of the great alliance on which the future of Europe hangs; but still, in comparison with his rivals, scarcely known. He has never won a great battle, but he is a great military power; he has failed repeatedly in diplomacy, yet he has acquired grand provinces without drawing a sword or firing a shot. He has fired on his own capital, and is the only sovereign in Europe who dare lounge about it; he has ruthlessly oppressed half his sub-

jects, and has won them back so thoroughly that loyalty to his person is the cement of his many kingdoms. He has shown fierce ambition at every turn, and he is regarded as the one ruler who may be trusted not to use any successes he may gain to further schemes of aggrandisement. Men who should know, and who are rarely mistaken, say that he is not an able State charioteer; but he drives, and has driven for years, eighteen horses abreast, and they all go on the course he dictates, and he stands all the while quite tranquil, and not perceptibly touching the reins.

From his accession to the present day, the history of the Emperor of Austria's life is to be sought and found in the history of Austria. He has lived and lives but for his public duties. The first thing he had to do was to pacify the revolted States. This done, the spirit of reaction once more awoke, and the constitution accorded in 1848 was revoked in 1851—a mistake that was to end in the exclusion of Austria from the Germanic Confederation; for Prussia and its adherents saw that the moment was favourable for playing that trump card which enabled them to realise, sooner than they dared hope, the programme that triumphed on the eve of Sadowa.

In August, 1853, the Emperor made his customary journey to Ischl, there to keep his birthday in domestic privacy. On this occasion his mother, the Archduchess Sophia, gave a small ball, for Francis Joseph and his brothers much enjoyed dancing, being in this respect true children of Vienna. Among the guests then at Ischl was the Duchess Louise of Bavaria, with her two elder daughters, Helene and Elizabeth. Francis Joseph desired that they, too, should be asked to the family party. The Duchess accepted for herself and Princess Helena, but refused for Princess Elizabeth, on the plea that she was not yet out, and that, further, they had brought no dress in which she could appear. But the Emperor, who had already been charmed by a brief view of his young cousin, insisted, and would take no excuse, saying, in his simple, good-natured way, that the simplest of dresses, with a coloured rose in her hair, would suffice to make his pretty cousin Queen of the Feast. Upon this the mother yielded, the pretty cousin went to the dance, with the result that she became, not only queen of the feast, but queen of Francis Joseph's heart, and future Empress of Austria. It is related that the Emperor danced almost exclusively with her all the evening, which naturally attracted attention. Towards midnight tea was served. During this pause the Emperor and Princess approached a table on which lay a huge album containing a collection of pictures of the various national costumes to be found in the eighteen States of Austria. The Emperor turned over its pages, showing them to his pretty partner.

"They are my subjects," he said. "Say one word, and you shall equally reign over them."

The Princess, who, it must be remembered, had known the Emperor already as a child, in lieu of any answer placed her hand in the hand he held out towards her.

"Later," he said, "I will give you your betrothal bouquet."

And, indeed, during the cotillion Francis Joseph presented his future wife with a magnificent bouquet of those curious soft white Alpine flowers, the edelweiss, which he had gathered himself in his intrepid rambles among the hills.

Next day, at ten o'clock, an Imperial carriage already stood at the door of the hotel where the Duchess of Maximilian was staying.

"Is the Princess Elizabeth up?" the Emperor asked of the man in waiting.

"Yes, sire, but she is dressing."

"No matter, I will go to the duchess." And then and there he asked for Princess's hand.

Half an hour after the whole Imperial family present in Ischl assembled in the little parish church, and here, to the strains of Haydn's popular national hymn, the betrothal of the Emperor of Austria with Princess Elizabeth of Bavaria was celebrated with all solemnity.

The news, of course, spread through the little watering place like lightning, and the same evening all the hotels and villas were illuminated.

Francis Joseph has indeed chosen well in the matter of his wife, who has proved herself in all respects suited to his tastes and ideas. She, like him, loves retirement and solitude, and shares his passion for riding and hunting. How devoted to the latter sport her repeated visits to England and Ireland during the hunting season have often proved. The daughter of Duke Maximilian of Bavaria, a plain bourgeois, addicted to literary pursuits, and loving retirement, she had been carefully reared, with her three sisters and only brother, in one of those romantic mountain castles with which Bavaria is dotted. This brother, the Archduke Theodore, who has since become a famous oculist, had brought, together with the father, an atmosphere of culture and love of study into the house. It was a patriarchal environment from which Princess Elizabeth went forth, one in which there was no love for meretricious pomp.

In April, 1854, Princess Elizabeth made her State entry into her future husband's dominions. She came by way of the Danube to Linz. Those who were present say it was a pretty sight to behold the lovely maiden of seventeen standing on the deck of the gaily-flagged steamer, ready to greet her Imperial lover, who stood awaiting her at the landing-stage. Francis Joseph could hardly wait till the boat was made fast. He sprang across the open space and pressed his bride to his heart in presence of all the people. That night the Princess passed with her parents in the castle of Schönbrunn. Next day she made her triumphal entry into Vienna, in a State chariot drawn by eight milk-white horses, all caparisoned with gold-embroidered trappings of heavy red velvet. She herself wore a dress of pink satin, covered with white lace, and in her hair a wreath of red and white roses, above which rose a diadem of diamonds. She was the youngest as well as the most beautiful Empress that had ever borne the sceptre of the House of Hapsburg, and this procession was one of the most magnificent spectacles ever seen in Vienna, that city of spectacular effects.

Not less striking was the marriage ceremony in the church, twenty-four hours later. The court church of the Augustines glittered with the lights of tens of thousands of wax tapers; the treasures of Golconda, all the colours of the rainbow, seemed showered down in the multitude of precious stones and jewellery in which the court ladies, the sword-begirt magnates, and the heavily-decorated dignitaries of the Empire sparkled. When the bride, led by her mother and mother-in-law, appeared in the church, she seemed a mass of white velvet embroidered in gold. The fair face was pale and set as marble, but nothing of pride or *hauteur* was

tragic end of their only son, the Emperor Francis Joseph addressed a few words to his faithful servant, Dr. von Smolka, which may be regarded as a monument raised to his wife, that will cause her to live in history more nobly than if she had been commemorated in stone or bronze. He said:

"How much I owe in these days of bitterness to my dearly beloved wife, the Empress, and what a great support she has proved to me, I cannot describe. How can I be sufficiently grateful that such a helpmeet has been given me? Tell this to everyone. The more you spread it, the more will I thank you!"

THE EMPRESS OF AUSTRIA.

there; only the look of a true woman in the most crucial hour of her young life. Later, when the newly-made Empress appeared in the Throne Room, leaning on the arm of her husband, to receive the homage of her lieges, the rosy colour had come back into her cheeks, but the happy, pure light still shone in her beautiful eyes. As for the Emperor, no one, it is recorded, had ever seen him look so happy, nor unbend so much as in that hour that first saw him with his young bride at his side.

Since her marriage it may be said of the Empress Elizabeth, as of fortunate natures, that she has no history. The union so romantically entered upon proved a happy one. When, in the days of their common sorrow, they were bowed down at the

Outside court circles few people know the Empress Elizabeth. Many Viennese have not even seen her, which is a loss for them, for Elizabeth of Bavaria was very lovely, and has preserved into middle age many remains of youthful charms. She believes in Diane de Poitier's elixir for perpetual youth, the morning dew. An intrepid horsewoman, she is often in her saddle at dawn, scouring the royal parks. Indeed, it is as a horsewoman, a bold huntress, a lover of dogs, that her Majesty is noted throughout Europe. It is all the more surprising, therefore, that this intrepid amazon was never taught to ride till she was twenty, and already a mother. For the rest, she has a virtue rare in a woman who shares a throne, of never meddling with politics. Indeed, she

openly admits that she neither cares for politics nor understands them, a remark which, when made on one occasion to Jokai, the Hungarian novelist, and member of the Anti-Imperial faction, elicited from him the remark, "It is the highest politics to win the heart of a countryman, and that is what your Majesty knows well how to do." But if the Empress keeps away from politics, she loves, on the other hand, to rule her court, and here the Emperor leaves her a free hand, allowing his wife the same independence in their home as he allows his ministers in the cabinet.

Of court life there is, perhaps, less in Austria than in any other European capital. Both sovereigns love retirement, and only do what is strictly necessary in the way of entertaining, giving an occasional dinner and two balls, at which, however, no ladies who have not sixteen quarterings of nobility are allowed to be present. One of these balls is known as the "Court Ball," to which go the Corps Diplomatique, and all those who have the right of presentation. The other is called the "Ball at the Court," to which go only those invited by the Emperor and Empress. When the Emperor is thus dragged out of his shell he goes through his functions in a dreamy, uninterested way, very different from the eagerness with which he stalks a deer or shoots a capercailzie, only obtainable at sunrise, or the ardour with which he throws himself into dreary details of business.

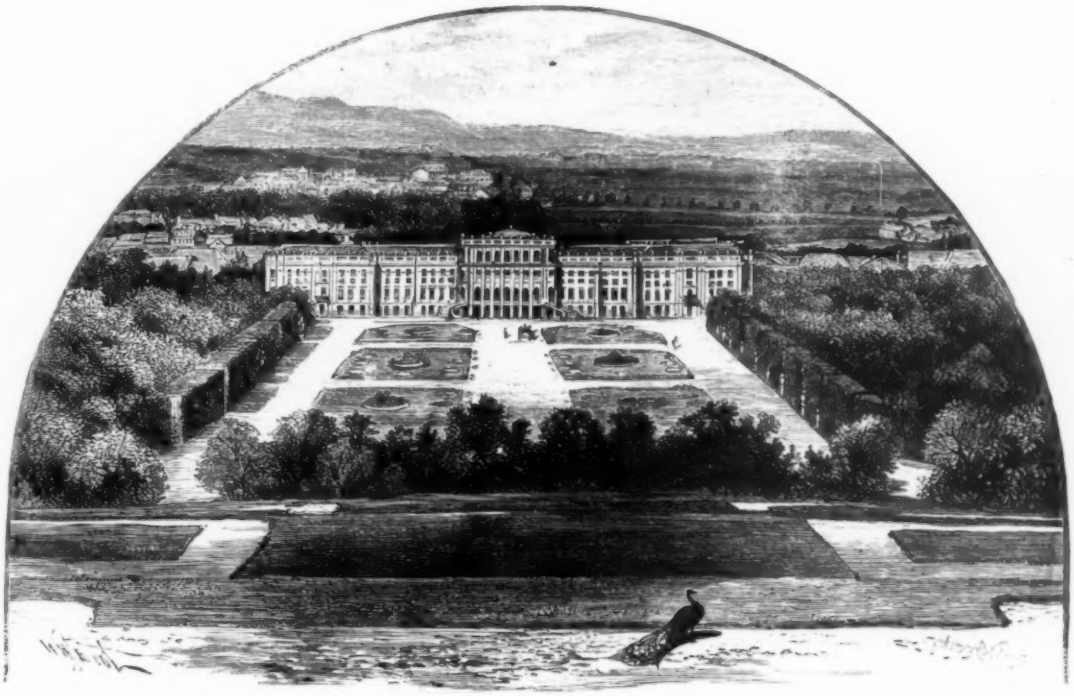
The descendants of the sixteen children of Maria Theresa, and of the seventeen of Leopold II, have surrounded the Austrian court with a crowd of Archdukes and duchesses. The court is, therefore, a most aristocratic one, into which no outsider penetrates. The present Emperor of Austria is not obliged to say, like his forefather, Joseph II, that in order to have the society of his peers he must go into the Capuchin crypt.

It is difficult to imagine a court and courtiers dissociated from their chief, yet such is the case at Vienna. The Emperor lives much alone, and his life is one of great simplicity. He rises early all the year round, and often he is surprised by his personal attendants sitting at his writing-table by four in the morning; and between the hour of rising and that of going to bed, usually at ten o'clock, lies a day of harder work than that of the tillers of the soil, relieved only by some reading. He has a wonderful memory, which is, of course, of great service to him in his public duties; but he achieves more by hard work and painstaking. His scrupulously regulated life also provides him with the necessary time for all his duties, even on days when he has to speak with from one hundred to a hundred and fifty persons, as is not seldom the case. He passes from a council of war to one of the audiences which he gives twice a week to the poorest of his subjects who have anything to ask, and he is always self-possessed, attentive, and patient. As there is no apparent hurry in his movements, so there is no haste in his words or his resolutions. So-called popular movements never carry him along with them. If there be a public outcry against any official, for instance, one may be quite sure that the Emperor will not seem to notice it. Yet, if the outcry prove to be justified, he will act in accordance with it. As regards petitions preferred to him by individuals, when once a case has been fairly made out for the Emperor's mercy or bounty, the applicant, however humble, may rest assured that what he has asked will be granted. When work is done the Emperor thinks over the questions and decisions of the day. Should he, in consequence, have further light upon a subject, he does not hesitate to alter his opinion. This has laid him open to the charge of vacillation, which is scarcely just. He is rather careful and cautious, fully aware of how much depends upon his personal decision, and afraid to exercise it unwisely.

"The Emperor has once more hit the nail upon the head," is a remark that has become proverbial among those who work with and under him.

Four children have sprung from the Imperial union. The firstborn, a princess, died at the age of two; the second, the Princess Gisela, is now married to Prince Leopold of Bavaria. It was not until 1858 that an heir came, the "Rudi," so ardently beloved by all the peoples of the composite Austrian Empire, and upon whom they built such high hopes for the old House of Hapsburg dynasty.

Prince Rudolph early showed a great taste for literature and the fine arts, while sharing also his parents' love for field sports. In the army he took little interest, preferring the more refined pleasures of travel or reading. He was also an excellent ornithologist, an active naturalist, an elegant writer; and these refined and educated tastes, added to his social charms, made him beloved by all who came in contact with him. He was, beyond all doubt, the most modern-minded of all Crown Princes, the most fit to deal with modern conditions, the most in harmony with their changed modes of thought.



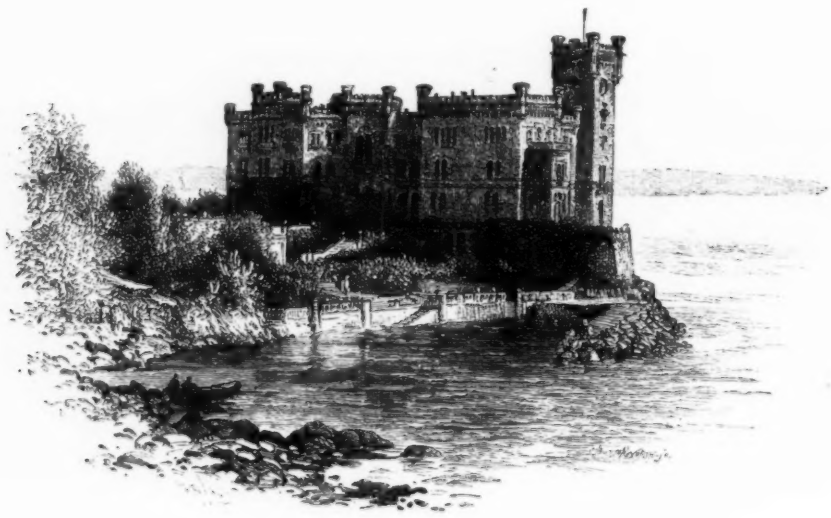
Archduke Rudolph was to his father's subjects a sort of hero of romance; his tall figure, his well-cut face, his soft blue eyes, his fair moustache shading the ugly Hapsburg mouth, were familiar throughout the Empire. He had the strongest love and admiration for his father, although his sentiments were, perhaps, mixed with a little fear, for the relations between a Crown Prince and his father are controlled by a number of stiff-backed persons, and subjected to laws of etiquette against which gushing natures like Archduke Rudolph rebel. No heir apparent to a throne, however, had a kinder father than he.

From his earliest youth he was fond of writing; his literary tastes he has inherited from his mother, and was quite young when his first production was published. He has left much literary work behind him, part printed, part yet in manuscript. It was in 1884 that he first conceived the idea of the monumental serial work, "Austro-Hungary in Word and Picture," to which he subsequently became one of the most active contributors, presiding in person over the sittings of the editorial staff. Only a month before his own death, lamenting the demise of a member of this staff, the Prince

said, "Whose turn next, I wonder?" even hinting that it might be his own. Indeed, for some time before his suicide his ideas had dwelt much on the theme of death, which had a ghastly attraction for him. It is said, though this probably is not the whole truth, that the bitter disappointment of having no son, nor the hope of obtaining an heir, weakened his interest in life.

In 1881 Crown Prince Rudolph was married to Princess Stephanie, daughter of the King of the Belgians, a princess known for her gaiety, her charms of mind and body; a favourite with court and people. By her the Prince had an only daughter, the little Archduchess Elizabeth, whom Salic law debars from the throne. Why the marriage was not happy it is difficult to know, but the fact remains. Already during their engagement sinister whispers were abroad, and, after the marriage, news came from Vienna from time to time bringing to the royal parents sad confidences regarding the princely *ménage*. The Archduchess complained of being abandoned, asked for leave to return to her mother, sued for divorce. Later, this petition for divorce was endorsed also by the Prince. But their demands had no effect.

Reconciliations were again and again patched up in vain, when suddenly, on January 31, 1889, the whole world was startled with the intelligence that Crown Prince Rudolph of Austria lay dead at his shooting castle of Mayerling. Official announcements could not hide the truth, and it soon leaked out that the Prince had committed suicide, together with the Baroness Marie Vetsera—the girl for whose sake he had implored divorce, or, failing it, for permission to renounce his heritage and live with her in strict retirement. The exact details of this double death will probably not be known for many a long year, but these are the main outlines. Such was the end of one on whom had been built hopes so high, and which his talents had justified to the full—a tragic end, full of lessons, full of warnings.



THE PALACE AND GARDENS OF SCHÖNBRUNN FROM THE GLORIETTE.

The youngest offspring of the Imperial Austrian couple is the Archduchess Marie Valerie, ten years the junior of her brother. She also possesses literary gifts, and has published poems that betray genuine feeling. After much domestic opposition, she is now the bride of her cousin, Archduke Franz Salvator, a love-match of which her parents at first would not hear.

We have said that the biography of Francis Joseph must be sought in the history of his Empire. Only on two occasions during his reign has he departed from the rule of avoiding all public manifestations, and of keeping his person in the background. The first was in 1867, when he and the Empress were crowned King and Queen of Hungary. The Emperor, mounted on a white horse, galloped up the hill that surmounts Buda-Pesth, and cut the air with Matthias Corvin's sword to the north, south, east, and west, to mark that he had taken possession of St. Stephen's crown, that henceforth Hungary had an independent King

and Parliament, and was merely a federal portion of the Austrian Empire. Curious that while this *fête* was proceeding, while all was joy and acclamation, three thousand miles away the Emperor's unhappy brother was at that moment being led to execution. Maximilian of Mexico was shot by his own subjects as Francis Joseph of Austria was greeted Apostolic King of the Magyars.

In 1879 the Austrian Imperial couple celebrated their silver wedding. On this occasion Vienna organised a most splendid procession, that rivalled the pageants arranged by Rubens in the palmy days of the Netherlands. The period chosen was that of the Emperor's great ancestor, Charles v. The whole was planned and executed upon a scale of grandeur and wealth indescribable. It

MIRAMAR.

proved one of the most splendid *fêtes* ever given in Vienna, which will, no doubt, never again see a public festival during Francis Joseph's reign.

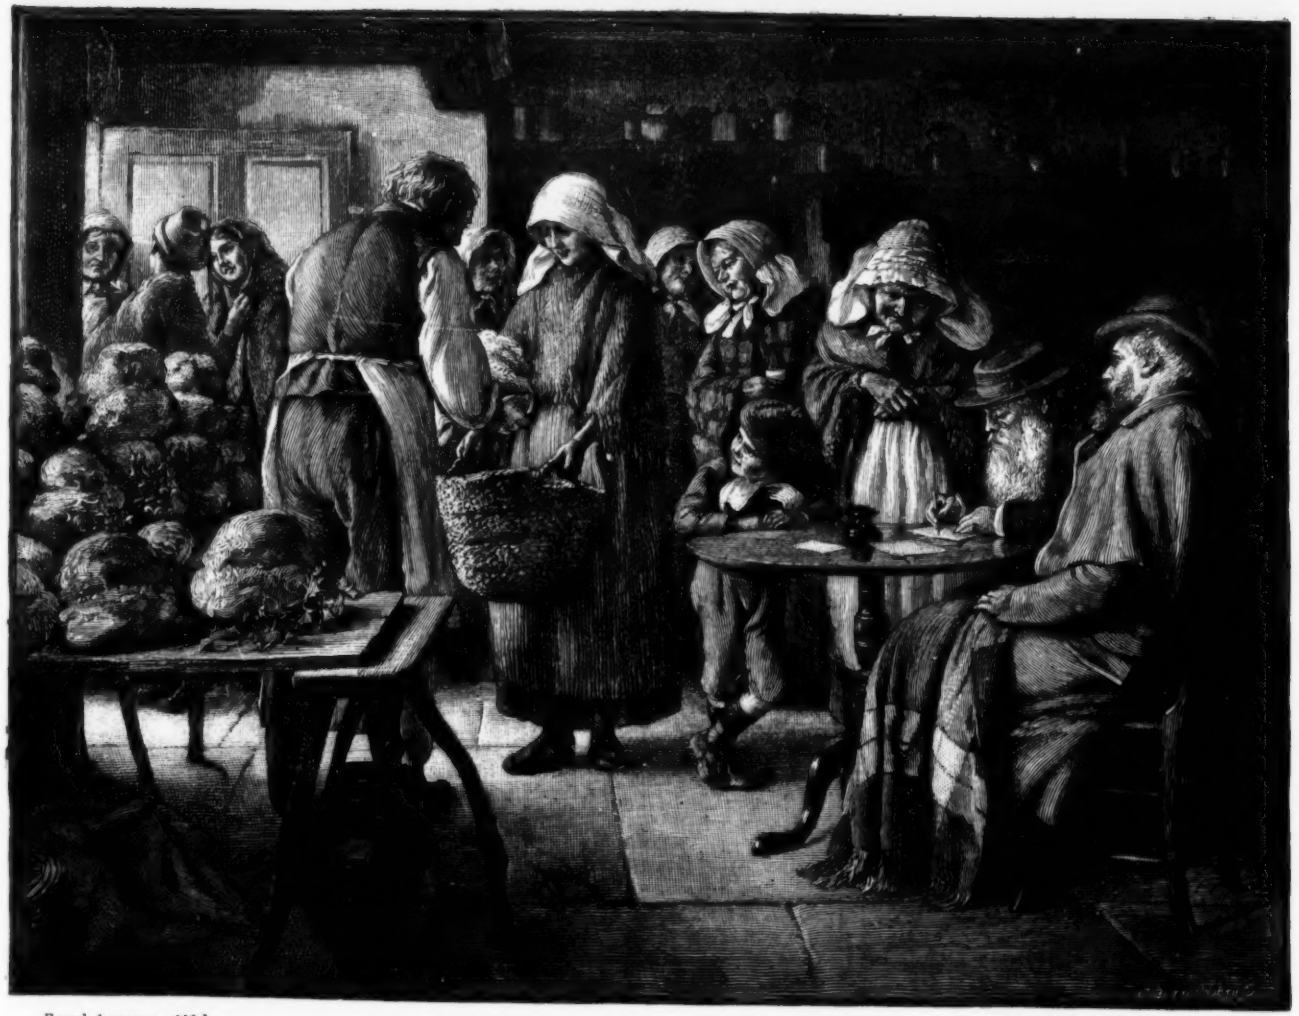
That pleasure-loving capital hoped, but hoped in vain, to celebrate with equal splendour the fortieth anniversary of the Sovereign's accession, which fell on December 2, 1888. But Francis Joseph had early made it known that he requested his subjects to abstain from any manifestation of rejoicing. He was well aware, he said, of the loyalty of his people, and he thanked them from his heart for their good intentions, but if they wished to please him they would abstain from all useless expenses, from all empty addresses, from everything that had no real or permanent value, and would instead devote the sums they would thus have spent to works of charity, or to promote art, science, industry; in fact, to any object for the general weal. And so sincere was he in this respect, that to avoid the smallest publicity he retired to Miramar, the lovely castle on the Adriatic, where he spent the day in the strictest seclusion, with no company but that of his wife and his thoughts, many of which may have been sad enough. But he cannot have passed it without some gladness also, for at least he has the satisfaction of knowing that for forty years he has honestly tried to do his duty; a fact to which the love his forty million subjects bear him testifies. And that they carried out his request was proved by the daily paper which continued for weeks to publish the lists of subscribers to the various charitable works founded and suggested afresh in memory of December 2, 1848–88.

It was a dark, a dangerous hour in Hapsburg history when Francis Joseph took the reins of Government into his Imperial hands. The old Austrian Empire was cracking to its foundations. It was a corpse of a Government, but not a State an object of contempt. And yet the worst that was then apprehended fell far short of what actually did happen. The events that followed would certainly have left an unpopular Emperor discredited and helpless. It has been a remarkable sign of Francis Joseph's power that out of every national disaster he has found elements for reconstituting national prosperity. Adversity has been a school in which he has been for ever learning with profit; and to-day, after over forty years of a reign overfull of troubles and anxieties, he finds himself clothed with more real authority than any of his predecessors possessed. He rules with a light hand, but his supremacy is unquestionable. Austrians would be indeed ungrateful if they forgot their debt to a nature which has enabled a born, bred, and crowned despot to educate himself into a model constitutional sovereign. And this result would have been impossible but for the possession by the Emperor of remarkable gifts of character and intelligence. He is a good man, animated by high moral courage. His subjects, who sincerely love

him, have a well-founded conviction that circumstances are responsible for his failures, and not he; that the calamitous issues of Magenta, Solferino, and Sadowa are not to be imputed to their Emperor-king. They lamented them as much on his account as on their own. They regarded him as the principal victim, whom it was their foremost duty to guard against the temptation to reproach himself for the calamity. This personal devotion to the Emperor has been a most important agent in the extrication of his dominions from an extraordinary and exceptional succession of ordeals and afflictions. By it the shock of catastrophes has been softened, and a series of deadly pitfalls have been securely passed.

Will his successor be able to guide these realms free from the jeopardy that ever threatens them? Who can tell? Had Crown Prince Rudolph lived, no doubt his popularity would have equalled that of his father: but of the present heir little is known. At best he has not been early trained to a position entailing as heavy a burden of responsibilities, and requiring as rare a combination of qualities, as any the world has to offer. Prince Francis Ferdinand is the son of Francis Joseph's brother, Charles Louis, a devoted and somewhat bigoted adherent of Mother Church. In these principles his children too have been reared. All Francis Ferdinand's tutors were Ultramontanes, members of that party which led Austria to Sadowa. But in the instability of human things who can say whether he will ever sit upon the throne that now seems to await him? Happily, Francis Joseph, notwithstanding his melancholy temperament and constitutional delicacy, remains upright as an oak, and his strong sense of duty will make him feel that this is not the moment to yield to personal inclination, and to abdicate or retire. All who wish well to Austro-Hungary, that curious complex monarchy, so needful for keeping the balance of European power, can but hope that the day when it may be needful to speak seriously of his successor is far distant.

The Emperor Francis Joseph is perhaps the most tragic figure among the living sovereigns of the world. His romantic history, his lifelong devotion to the duties of his position, and his patient submission to its trials and its burdens, his overwhelming sorrows, and his noble endurance, have endeared him to all his subjects, and extorted the admiration as well as the compassion of the civilised world.



## A Christmas Wish.

WHAT can I wish you, since I cannot tell
What may be best to say?
Though love should prompt me, I might not be well
Able to choose or pray.
Man's sight is faulty, and he sees not far.
Where joy is, sorrows are.

If *wealth*, it might mean burdens to my friend,
Nor doth wealth make joy sure;
If *love*, it might mean peace was at an end,
Nor doth all love endure;
*Prosperity* might lead from heaven away,
And what then should I say?

I'll leave the matter in Another's hands,
Who better knows your need.
I wish you well, and that He understands
And none so well indeed.
These good old words have served for many a day—
"GOD BLESS YOU!" I will say.

IDA J. LEMON.

*Royal Academy, 1888.*] THE CHRISTMAS DOLE. [*After Joseph Clark. By permission.*

# MEN AND MANLINESS.

"HE is, at any rate, a man!" Simple words, forsooth! but when they come from honest and intelligent lips they constitute one of the most complete certificates of worth that is possible to be given one human being by another. And manliness is ever attractive—magnetic, in fact, drawing all sorts of souls to it. Strong ones feel and see it, and claim brotherhood with its possessor; weak ones look at it, and, seeing how desirable a possession it is, grow stronger the while in the contemplation. Well has it been said that "one anecdote of a man is worth a volume of biography."

We all remember Charles Lamb's picture of man living in the days before candles came into vogue—spending savage, unsociable nights, wintering in caves and unillumined fastnesses, lying about and grumbling at his brother in the dark, and positively having to handle his neighbour's cheek to be sure that he appreciated the passing joke. "The aboriginal man in geology, and in the dim lights of Darwin's microscope, is not," confesses Emerson, "an engaging figure. We are very glad that he ate his fishes and snails and marrowbones out of our sight and hearing, and that his doleful experiences were got through with so very long ago. They combed his mane, they pared his nails, cut off his tail, set him on end, sent him to school, and made him pay taxes before he could begin to write his sad story for the compassion or the repudiation of his descendants, who are all but unanimous to disown him." However this far story may stand, in the time of our Saxon ancestors all men were ranked into three classes—the lowest, the middle, and the highest—and were valued according to the class they were in; that is, if any injury was done, satisfaction was to be made according to the value or worth of the man to whom it was done. The lowest were valued at two hundred shillings each, the middle at six hundred, and the highest at twelve hundred. A pronounced difference, of a somewhat similar nature, is still current among some of the negro tribes. "At Widah, Des Marchais was distinctly told that the nobility only knew of the supreme God as omnipotent, omnipresent, rewarding the evil and the good; and that they approached Him with prayers only when all other appeals had failed. There is, however," continues Max Müller, who uses this illustration in one of his lectures, "among all nations, savage as well as civilised, another nobility—the divine nobility of goodness and genius—which often places one man many centuries in advance of the common crowd."

"There are words which reveal a wrong or insufficient estimate that men take of their duties—or that, at all events, others have taken before them, for it is possible that the mischief may have been done long ago, and those who now use the words may only have inherited it from others, not helped to bring it about themselves. An employer of labour advertises that he wants so many 'hands,' but this language never could have become current; a man could never have thus shrunk into a 'hand' in the eyes of his fellow-man unless this latter had in good part forgotten that annexed to those hands which he would purchase to toil for him were also heads and hearts—a fact, by the way, of which, if he persists in forgetting it, he may be reminded in very unwelcome ways at the last.[1] In Scripture there is another not unfrequent putting of a part for the whole, as when it is said, 'The same day there were added unto them about three thousand *souls*' (Acts ii. 41). 'Hands' here, 'souls' there—the contrast may suggest some profitable reflections."[2]

Just a word of protest, in passing, against the frequent misuse of the term "gentleman," which too often carries with it the idea of one who has no need to work. Who would not rather have the manliness to work than the gentlemanliness to shirk it? And yet perhaps it is best to treat this matter as but parody and trifling nonsense, remembering that it was reckoned worthy of a Lacedæmonian to bear a jest.

> "Howe'er it be, it seems to me,
> 'Tis only noble to be good;
> Kind hearts are more than coronets,
> And simple faith than Norman blood."[3]

Hesiod informs us that in his days "no business was looked upon as a disparagement, nor did any trade cause a disadvantageous distinction. The profession of merchandise was honourable, as it brought home the produce of barbarous countries, engaged the friendship of kings, and opened a wide field of knowledge and experience. Nay, some merchants have been founders of great cities—Protus, for instance, that built Marseilles, for whom the Gauls about the Rhone had the greatest esteem; Thales also, and Hippocrates, the mathematician, are said to have had their share in commerce; and the oil that Plato disposed of in Egypt, defrayed the expense of his travel."

"If Racine or Corneille had framed a psychology, they would have said, with Descartes, 'Man is an incorporeal soul, served by organs, endowed with reason and will, living in palaces or porticos, made for conversation and society, whose harmonious and ideal action is developed by discourse and replies, in a world constructed by logic beyond the realms of time and space.' If Shakespeare had framed a psychology, he would have said, with Esquirol, 'Man is a nervous machine, governed by a mood, disposed to hallucinations, transported by unbridled passions, essentially unreasoning, a mixture of animal and poet, having no rapture but mind, no sensibility but virtue

---

1 "Beware when the great God lets loose a thinker on this planet."—*Emerson.*

2 Archbishop Trench: "Study of Words."

3 Tennyson.

imagination for prompter and guide, and led at random, by the most determinate and complex circumstances, to pain, crime, madness, and death.'" So writes M. Taine. Not everyone will endorse these words, penetrating though they be. We prefer abiding in the simple statement that man was made in the image of God. Is it not nearly sufficient for man to know that the more Godlike his attributes grow the more of manliness does he become possessed of? Plain definitions, when we have to do with matters of life and duty, are preferable to any complex descriptions or varied suggestions.

"Study nature," is the exhortation of Victor Cousin; "elevate yourselves to the laws that govern it, and make of it, as it were, a living truth—the more profoundly you understand its laws, the nearer you approach to God. Study, above all, humanity; humanity is much greater than Nature, for it comes from God as well as Nature, and knows him, while Nature is ignorant of Him." Pascal, however, made confession and said: "I have spent much time in the study of the abstract sciences, but the paucity of persons with whom you can communicate on such subjects gave me a distaste for them. When I began to study man, I saw that these abstract studies are not suited to him, and that in diving into them I wandered further from my real object than those who were ignorant of them, and I forgave men for not having attended to these things. But I thought, at least, I should find many companions in the study of mankind, which is the true and proper study of man. I was mistaken. There are yet fewer students of man than of geometry."

This is almost as discouraging as if he had got into the frame of mind which caused Carlyle to cry out: "O my friends, we are (in Yorick Sterne's words) but as 'turkeys driven, with a stick and red clout, to the market;' or if some drivers, as they do in Norfolk, take a dried bladder and put peas in it, the rattle thereof terrifies the boldest!" And yet Carlyle might well have put to himself his own question just here: "Wilt thou know a man, above all a mankind, by stringing together beadrolls of what thou namest facts?"

We are strangely tempted sometimes to think that, after all, there is very little distinctive individuality in the world. Take a crowd, for instance, all with upturned faces, eagerly watching the passing of some trifling phenomenon. They have all hastened hither with the same intent, some leaving sickness or the immediate call of duty, some the getting of bread to feed hungry mouths; some come from the cottage, and others from the mansion. All is forgotten save the momentary sight. But, in spite of it, you will find a definite personality in each body there assembled. If, unseen ourselves, we could follow one of these individuals "through a single day of his life, and know all his secret thoughts, and hopes and anxieties, his prayers and tears and good resolves, his passionate delights and struggles against temptation—all that excites and all that soothes the heart of man—we should have poetry enough to fill a volume";[1] and, it may be added, facts enough to form a basis for thoughts of a lifetime.

Individuality is one of the prime elements of manliness. "Distinctness is a great merit in roses, especially when the French rosarians have so overpiled the catalogue. It is pleasant to walk up to a standard, and say, 'You are "Jules Margottin," and your neighbour the "Keepsake of Malmaison;" I cannot mistake you for any other, however hot the weather may be! Distinctness is also a merit in apples, pears, and even peaches; but most of all in man. And so, without knowing the reason, perhaps, we like a man whom we cannot mistake for any other of our million brethren."[1] There are, of course, the ordinary attributes that make the boy boyish, and the man manly, which always give the onlooker pleasure, despite their antithesis to individuality, for they show humanity in its naturalness.

> "How I love the festive boy,
> Tripping with the dance of joy!
> How I love the mellow sage,
> Smiling through the veil of age!"[2]

In one of the Spartan part-songs the old men began:

> "Once in battle bold we shone."

The young men answered:

> "Try us; our vigour is not gone.'

And the boys concluded:

> "The palm remains for us alone."

An absorbing love of truth characterises a man. He does not, of necessity, bother himself over hair-splittings in the definition of what lies close to his life and conduct; he loves it, lives in it, leans on it, and is satisfied. He is true to his Maker, to himself, and towards the world; the matter needs no explanatory terms. In the one direction he says: "I have chosen the way of truth. . . Thy law is the truth. . . My mouth shall speak truth"; and in the other he proclaims: "Henceforward I am the truth's. Be it known to you that henceforward I obey no law less than the eternal law." This is sometimes termed self-reliance, but it needs other words for adequate expression.

"To live on your own convictions against the world," says Frederick Robertson, "is to overcome the world; to believe that what is truest for you is true for all—to abide by that, and not be over-anxious to be heard or understood or sympathised with, certain that at last all must acknowledge the same, and that while you stand firm the world will come round to you—that is independence. It is not difficult to get away into retirement, and there live upon your own convictions; nor is it difficult to mix with men and follow their convictions; but to enter into the

[1] Longfellow.

[1] Blackmore: "Cradock Nowell."
[2] Moore.

world, and there live out firmly and fearlessly, according to your own conscience—that is Christian greatness."

This passage is but a page of Emerson's essay on "Self-Reliance," extracted and re-uttered by Robertson; and is, perhaps, somewhat deficient in due recognition of a man's position in the world as an individual, influenced by, and, in turn, influencing others. Personal dignity and freedom are both excellent things; but the man or woman who is continually thinking of them is "gey ill to live with." And the evil does not always end there. Unless the man who takes upon himself this personal dignity for a garment, has a just and adequate conception of his true position and unmistakable duty, in the spot in which God has been pleased to place him, and of the relation of his thoughts to the great truths which govern other men, he is apt to become, instead of magnificently self-centred, mean and miserably selfish. However exalted one's position might be, it is generally open to an increased sweetness and manliness from contact with outside standards. What a prig (if nothing worse) a young man would develop into if the burden of his considerations was ever self, self! Originality is, after all, but a very small part of life. Yet a strict adherence to purposes, in spite of the scoff or pity of the world, raises a man considerably above the run of his fellows.

Manliness is seen in an upright bearing in business engagements, in public duties, and in the private delights of friendship and love. Strength and rugged integrity in the world are not all; a man must be a man in his affections:

> "Heart and soul
> A very man, tender and true, and strong
> And pitiful."[1]

A man is also evident in his speech. We all recollect the worthy old laird in Black's "White Wings," and the occasional wisdom of his remarks. "A fine ceety," he said, speaking of Edinburgh; "but the people themselves!" Here he shook his head, and continued: "And their manner o' speech is most vexsome—a long, sing-song kind o' yaumering as if they had not sufficient manliness to say outright what they meant." It is not our intention just here to enter into a discussion of the comparative value of speech and silence—that may be done again—but memories of the wise things within the covers of our Plutarch come to us. Lycurgus considered the worth of speech to consist in its being comprised in a few plain words, pregnant with a great deal of sense. The intemperance of the tongue, he contended, made conversation empty and insipid. King Leonidas said to one who discoursed at an improper time about affairs of some concern, "My friend, you should not talk so much to the purpose of what it is not now to the purpose to talk of." Charilaus, the nephew of Lycurgus, being asked why his uncle had made so few laws, answered: "To men of few words, few laws are sufficient." And to some people, finding fault with Hecatæus the sophist because when admitted to one of the public feasts he said nothing all the time, Archidamidas replied: "He who knows how to speak, knows also when to speak."

Both joy and sorrow fail to unduly affect a manly man. Joy does not inordinately puff him out; he is quietly appreciative and thankful—by no means boisterous. It were folly to assert that trouble does not touch him; but it is only the man of meaner mould who flaunts his mishaps in the face of the world—a world generally too absorbed in its own business to pay heed to his puny wail. In the old Norse-German poem of "Godrun," it is said of Hartmut that no comelier man existed; "in all his sorrows he stood as if he had been drawn well with a pencil." Trials only make a man realise that he is a pilgrim and traveller to a far country, and that in the common order of affairs he must, occasionally, needs be more or less foot-sore, and lose now and then one of his road companions. In spite of all the miseries that might cleave to us and hold us, as it were, by the throat, there is within us an irrepressible instinct which exalts us. "The greatness of man is so visible that it may be deduced from his very misery. His very miseries prove his greatness. They are the miseries of a great lord, of a dethroned sovereign. The greatness of man consists in his knowledge of his misery. A tree does not know itself to be miserable."

Where manliness is, there is growth—growth of inner life, of intellect, of character.

> "All my life long
> I have beheld with most respect the man
> Who knew himself and knew the ways before him,
> And from amongst them chose considerately,
> With a clear foresight, not a blindfold courage;
> And having chosen, with a steadfast mind
> Pursued his purposes."[1]

One cannot very well stand still; it is either addition or multiplication—or subtraction. Every day on which a man does not make progression is a gift from God thrown thanklessly back in His face. It is a truism to say that what has gone of this kind returns not ever; nevertheless the fact is too little heeded. There is much mingled wit and wisdom in Oliver Wendell Holmes's "Autocrat of the Breakfast Table," but I question very much if there is anything more beautiful to be found in it than his poem, "The Chambered Nautilus," with its—

> "Build thee more stately mansions, O my soul,
> As the swift seasons roll:
> Leave thy low-vaulted past;
> Let each new temple, nobler than the last,
> Shut thee from heaven with a dome more vast,
> Till thou at length art free,
> Leaving thine outgrown shell by life's unresting sea!"

[1] Lewis Morris.

[1] "Philip Van Artevelde."

In this growth manliness asserts itself by placing a foot, ruthlessly if needs be, upon any past experience or attainment that in any way blocks the path now seen to be meet to travel in. This, we freely admit, is a difficult task; for, alas! how often do little duties absorb all our attention when greater ones clamour the while around our very doors! It is just the old story of the friar devoting his days to literary work, whilst more serious duties called him away. But he hesitated not when he woke up and heard the call; he simply said:

"Thou know'st that I did yearn to make
Thy Word more lovely to the eyes
Of sinful souls, for Christ His sake!
Nathless, I leave the task undone;
I give up all to follow Thee—
Even like him who gave his nets
To winds and waves by Galilee!" [1]

Even our past failings may help us to future attainments. *De vitiis nostris scalem nobis facimus si vitia ipsa calcamus* (Of our vices we make ourselves a ladder when we trample on them), wrote St. Augustine.[1]

A higher manliness yet is seen in the beautiful submission of self to the will of God. Perhaps, after all, it is but perfectly natural that a man should distinctly assert himself in the world, carry all before him by sheer force of completeness of manhood, lead men hither and thither, and mould nature to his wish and determination. And yet it is possible—distinctly and gloriously possible—for such a character to so live his inner life as to know his chiefest delight in the will of his Father. It is a mystery we freely grant—a mystery, by the way, that can only be understood through experience—the experience of a daily sacrifice of all, as the heart speaks: "Not my will, but Thine, be done."

J. ROGERS REES.

[1] Thomas Bailey Aldrich.

[1] St. Augustine! well hast thou said,
That of our vices we can frame
A ladder, if we will but tread
Beneath our feet each deed of shame!"
—*Longfellow:* "The Ladder of St. Augustine."

"I held it truth, with him who sings
To one clear harp in divers tones,
That men may rise on stepping-stones
Of their dead selves to higher things."
—*Tennyson:* "In Memoriam."

## "He always kept his place."

So said the old dame, I remember,
As trembling we stood at her knee,
In her schoolroom, the shady front parlour,
And spelled out in turn, "A, B, C."
As old memories round me thus linger,
I see each familiar face:
And wee Johnnie, with patient forefinger,
Ever painfully keeping his place.

He was always most meekly attentive
While the rest of us idled and played;
But his mind was but feebly retentive,
And slow was the progress he made.
So the dame, in rebuke of the others,
Said, with stern, wrinkled, spectacled face,
"Johnnie mayn't read so fast as his brothers,
But he keeps somehow always his place."

'Twas the same when, a year or two later,
We met in the large village school;
While I proved a discipline-hater,
Friend John kept each trivial rule.
And yet, as we moved through the classes
With more or less speed in our pace,
He somehow got behind with his passes,
And kept much the same humble place.

And when, school being over, to college,
Or business, or work we all went;
And to use or increase acquired knowledge,
Our energies sternly we bent;
John, too, in a humble sphere started
To run, like the rest, his life's race;
And he told me with pride, as we parted,
That the grocer had found him a place.

As frequent vacations gave leisure,
Again in the old village home
I greeted old schoolmates with pleasure,
And heard of those given to roam.
A few years, and they all had been scattered—
Some had died, some had fled in disgrace—
But John—sure the neighbours felt flattered—
He never would leave the old place.

By all in the village respected,
His master's acknowledged right hand;
Yet no one who knew him expected
That he his full meed would demand.
At the meeting-house, faithful as ever,
He shone by his one special grace;
For, though neither brilliant nor clever,
He always was found in his place.

Yet no one—he least of all others—
Rightly valued a service so rare.
He would toil; but he made way for others
Whene'er there were honours to share.
And they, in their self-approbation,
Could see nothing odd in the case.
They expected a prominent station;
He wished but to keep in his place.

So it was till, one day, without warning,
He was absent for once—and for aye!
Then, amid vain regrets and loud mournings,
All too late they his worth could assay.
I oft think that when wisdom unerring
Declares the awards of life's race,
We should most of us gladly be sharing
The honours of John's rightful place.

"TOM BROWN."

# THE BUILDING OF THE FORTH BRIDGE.

THE Forth Bridge is as long as from the York Column, in Waterloo Place, to St. Paul's Cathedral. Stand at the column, and look up Regent Street, the distance to the Fire Office in the Quadrant is the exact width of one of the spans of the mighty bridge. Build the column until it is three times as high as it is now and you will have the height of the great towers. Place the column half-way up the hill, as if under one of the spans, the arch that will spring from the pavement where you stand to the pavement on the hill-top will easily clear it; and if the road were the river you might sink the column vertically till it disappeared, for before it touched bottom there would be seventy feet between the surface of the water and the spike on the statue's head. In fact, you may stand St. Paul's at the base of that sunken column and the bridge will overtop the cross.

One of the uses of the Eiffel Tower which did not occur to the mind of its designer is that it serves as a convenient measuring rod for objects greater than itself. Hang six Eiffel Towers horizontally on granite piers; make them so strong that five of our largest ironclads can be hung on to them to swing in the air; join them end to end with girders and form a roadway from shore to shore, and you have the bridge that Sir John Fowler and Mr. Benjamin Baker have built to supply the missing link in our railroads to the north.

Ten years ago—it was on the 28th of December, 1879—the bridge over the Firth of Tay was swept away in the raging storm. The engineer of that ill-fated structure had also designed a bridge across the Firth of Forth, and some preliminary work had been entered upon. It was to be a colossal suspension bridge, with towers nearly 600 feet high, on Inchgarvie, from which the chains were to drop in a graceful curve to the Fife and Midlothian shores. But with the Tay Bridge went much of the designer's reputation, and the promoters of the Forth undertaking grew nervous, and the plans were referred for reconsideration, and, in short, the suspension bridge was abandoned, and an alternative plan found favour. The alternative plan was that of the bridge now erected. Seven years ago, in 1882, the work began; on Thursday, the 26th of last September, a workman placed a ladder loosely on the jibs of two opposite cranes and crossed the gap; and now the bridge is completed from end to end.

It will be remembered—or if not, it may as well be assumed to be remembered—that Sir Walter Monkbarns finished his lecture on *castra stativa* and *castra æstiva* at Mr. Mackitchinson's, where he had been deposited by the Hawes fly or Queensferry diligence; and it will also be remembered that it was at this same inn that David Balfour made his first acquaintance with Captain Hoseason of the brig Covenant of Dysart. This very inn is now at the foot of the Forth Bridge.

From the Fife shore the Ferryhill peninsula juts out, and narrows the Firth to the width of a good-sized river. To the west is a land-locked haven; to the east is the North Sea. Between the peninsula and the southern shore is an island; and hereabouts, for eight hundred years at least, there has been a ferry which has given its name to the villages on each bank.

Queensferry—South Queensferry, that is—is a royal burgh which has seen reverses. The queen from whom it had its name was the Saint Margaret, the daughter of the Ætheling in whom William the Norman took such malevolent interest. She married Malcolm Caenmore; and while her father gave his name to Port Edgar, the little harbour to the westward, she gave hers to the ferry and to the anchorage which is still known to mariners as St. Margaret's Hope. That the ferry might be in neutral hands, her grandson, Malcolm, gave it to the monks of Dunfermline, with a subsequent reservation that the monks of Scone should always cross without fee. In those days Queensferry prospered, but of late life had not been cheerful in it; and in 1881 the royal burgh actually went bankrupt, and had to shake off its creditors on the terms of five half-crowns in the pound! That, however, was its dark hour before the dawn, for next year the building of the bridge began. It was then a home for under two thousand people, lodged in two streets that crossed each other. Over the Firth is North Queensferry, on the peninsula, a village of about as many people as there are days in the year. After Paul Jones, on mischief bent, was blown out of the Firth— by wind, not by gunpowder—in 1779, North Queensferry was strengthened by a fort; and a fort was also built on the island of Inchgarvie, where the old castle had been a state prison until the purchase of the Bass. When the bridge works began, Inchgarvie castle and the battery were roofed over and made into comfortable habitations, and the Queensferrys, North and South, awoke from their nightmare of neglect.

For eight centuries and more men had been satisfied with the ferry, but in 1808 a proposal was made to drive a tunnel under the Firth to Rosyth sufficiently wide and high for horse and foot traffic—a scheme far too venturesome for the financiers of those days. What could not be done for the turnpike might, however, be done for the railroad when the traffic became pressing enough; and the idea of the tunnel was only abandoned, or postponed, when the possibility of a bridge became clear.

The site of the old ferry, with its peninsula and island, seemed made for a bridge. But the difficulty was how to deal with the depth of water, or how to get a span which would avoid that difficulty. The Forth is not the longest bridge. That honour, at present, belongs to the new Tay bridge, which is two miles and fifty-two feet long; but then the Tay has forty-one piers, and its

middle spans are only 245 feet wide. The Forth is not the highest bridge. It is twice as high as the Newcastle High Level; but there are higher. It is the span which gives it its pre-eminence. Roebling's great suspension bridge at Niagara Falls has a span of 821 feet; the famous Brooklyn bridge has a span of 1,600 feet; the two main spans of the Forth bridge are each of 1,710 feet. The gigantic suspension bridge of Sir Thomas Bouch solved the difficulty of the span, and for it the Act of Parliament was obtained in 1873; it was then the only method in practice of bridging such intervals; but at the reconsideration of the scheme the present method was proposed, and it was at once admitted by the majority that the new idea was better than the old.

A new idea it was thought to be, but not for long. As soon as it was published it was pointed out that the system had been known for centuries —of course in China; and then Japan and India put in a claim; and then—most unlooked-for discovery—it was unearthed that as recently as 1810 a Mr. Pope, poet, not of Twickenham, but of New York City, had proposed to span the East River at New York on the same principle, and had not only exhibited a model showing how it was to be done, but had even written a poem, as well as a specification, in which he announced that "Each semi-arc is built from off the top, without the aid of scaffold, pier, or prop!" But, somehow, Mr. Pope had been forgotten, like the Hindoos, Chinese, and Japanese; and with the Forth Bridge the plan first took its place in modern engineering. And since its publication every long-span bridge in the world has been built on its principle.

That principle is obvious when we look at the bridge; the colossal cages are built outwards from the piers in such a way that their arms balance each other. If a weight be placed where they join when finished, there will be a pull along the top of the cage and along all the bars hanging downwards, and a pressure along the bottom of the cage and on all the bars thrusting upwards. Wherever there is a pull a lattice girder is used, wherever there is a thrust a tube is used; consequently all the members of the great trellis-work that diverge upwards from the top are girders, and all those that diverge upwards from the bottom are tubes. We have already illustrated and described the cantilever principle,[1] so that we can here be brief. A cantilever is practically a bracket; the brackets are placed base to base, and balance each other, and get their anchorage at their extremities. But in the Forth Bridge the brackets are brackets of Brobdignag; the tubes that look like slender spars are twelve feet in diameter, and the seemingly trifling granite piers that in groups of four carry this mighty object-lesson in permanent stability are sixty feet across.

The Inchgarvie tower is 260 feet wide, the towers on each side of it are 145 feet wide. The bridge, which has twenty acres of paintable surface, consists of nineteen girder spans and seven masonry arches. The masonry arches account for 395 feet of length; then there are eleven horizontal girder spans each of 168 feet, two of 173 feet, and two of 179 feet, ending at the masonry piers on each side, which rise to 209 feet above high water. Then come two single cantilever spans, each of 689 feet 9 inches; and then the two great double cantilever spans, each of 1,710 feet, for 500 feet of which there is a headway for navigation of 150 feet at high water.

When the bridge was begun by the contractors, Messrs. Tancred, Arrol, and Co., in 1882, their first step was the laying out of the shops and building yards along the bank, 100 feet above the Forth, with a wire-rope railway to the river. These grew as the work progressed, and for years the Edinburgh folk, at the cost of half an hour's ride from Waverley, had the opportunity of witnessing the whole process of bridge-making. Ordinary bridges are delivered from the foundry ready for erection, but the Forth Bridge was much too big an affair to be dealt with in the ordinary way.

In January, 1883, the foundations were commenced. For the piers for the shore spans in shallow water, timber cöffer-dams were used; but six of the circular piers out of the twelve required under the three towers were constructed by means of pneumatic caissons. The making of these caissons —"cassoon" is the workmen's rendering—was the first noteworthy undertaking, and great was the excitement when one of the gasometer-looking cylinders, 70 feet across, was launched and floated out into position, with the men clustering round the rim, cheering and gesticulating as the great iron tub slowly voyaged across the stream.

The caisson is really a diving-bell. Seven feet from its lower edge a floor is laid in it. Into the space below the floor compressed air is driven so as to keep it clear of water, and in this space the men work. Communication with the upper floor is had by means of an air-lock, a contrivance with two sets of gates, on the same principle as the familiar water-locks on our rivers and canals. We enter the lock from without, and the sliding door is shut behind us; the air is then of the normal pressure, but when the inner door is opened the compressed air fills the chamber, as our ear-drums immediately tell us if we forget to keep our mouths open so as to equalise the pressure within and around us. The doors are interlocked like points and railway signals, so that both cannot be open at the same time. Descending into the space below, we find the men—mostly Italians and Belgians from the Antwerp Harbour Works—at work in the full brilliancy of the incandescent electric light. The hard whinstone is excavated by percussion drills and dynamite, and raised through the air-lock; the hard boulder clay is cut into by the hydraulic spade; the mud is thinned with water, a pipe communicating with the upper air is laid in the dirty puddle, a valve is opened, and away aloft the mud is driven by the atmospheric pressure. Down sinks the caisson as the ground is cut away beneath and within it. As it sinks it is loaded above with concrete. It has an inner skin seven feet from the outer skin, cut up into pockets by diaphragms, so that the pockets can be loaded at any part where extra pressure is required

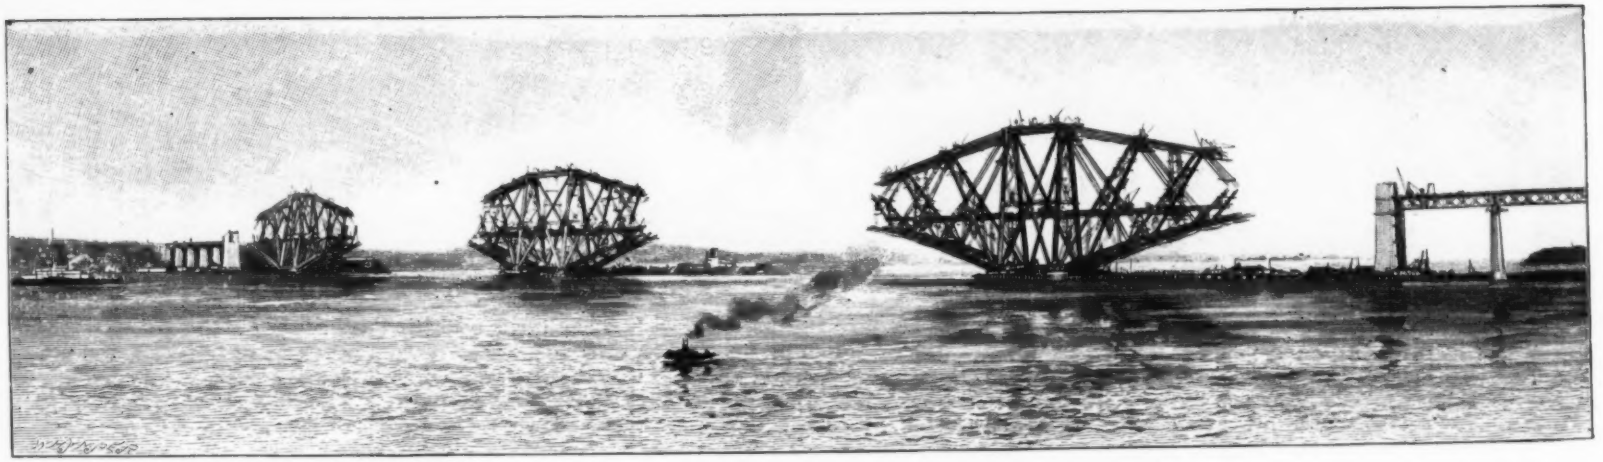
[1] See "Leisure Hour" for January, 1883, page 64.

Where there is a gap the air escapes in an ascending stream of bubbles through the river. Attracted by the bubbles and the light, an enterprising salmon comes in to see what it all means. Instantly the navvies become fishermen, and in a few minutes the inquisitive fish has paid with his life for his pardonable curiosity.

Working below water is not without its dangers. The excavation must be regular, so that the caisson does not cant. One of the caissons once dropped seven feet with a jerk, much to the alarm of the men; but the only fatal accident was with the south-west Queensferry caisson, which grounded as it was being floated into position, and collapsed, and killed two men as it was being pumped out. To start the sinking caisson with a level floor, sand-bags were used to fill in the slope; and then the cutting away of the clay and whinstone soon bedded the rim in safety. Once a gentleman brought a flask of whisky down with him to drink success to the new pier; the success and the whisky he drank, and he corked his empty flask and placed it in his side pocket; he entered the air-lock, the door was shut behind him, the outer door was opened, and bang went the whisky flask. He was again under normal pressure, and the air from below would have served him as it had done his flask if he had similarly corked himself.

When the caisson had sunk into position—eighty-eight feet below high-water mark was the greatest distance it had to go—it was filled entirely with concrete made of whinstone from the Fife quarries, and sand and Medway Portland cement, of which latter no less than 30,000 tons were used for this purpose; even the mining chamber was rammed full of this material grouted up under pressure. Then on the solid drum of concrete came courses of flat bedded Arbroath stone faced with Aberdeen granite. And on this granite pier, now reduced to sixty feet across, were laid the bed plates of steel—massive slabs like armour plates, bolted down by a forest of steel bolts built round for many feet deep in the concrete and masonry. And then the bed plates were smoothed by emery wheels and coated with crude petroleum to keep them slippery, and on them the skewbacks were bolted in elliptical holes, so as to provide for whatever contraction or expansion change of temperature might cause in the great bridge.

Great bridge indeed! For from the base of the deepest pier to the top of the tower above the height is only ten feet less than that of the great pyramid of Cheops. Other bridges may be built to beat it in size, but it will always be a famous bridge as having been the one in which the difficulties of cantilever construction in steel were first overcome.

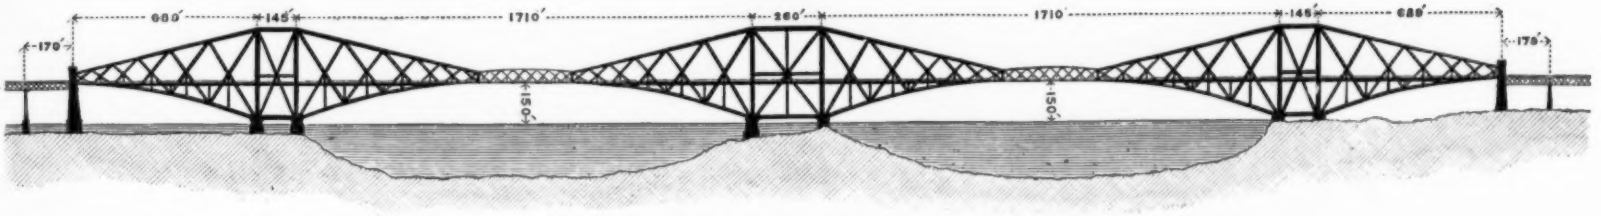


The Eiffel Tower is built of iron, and therein is behind the age. The Forth Bridge is built of steel, mild steel from three-quarters of an inch to an inch and a quarter thick, in plates and tees, and angles and channels—half-inch plates that can be folded like newspapers, and rivet bars that can be tied into knots without a sign of fracture. Altogether there are some 53,000 tons of steel, most of it from the Steel Company of Scotland, and some of it from the Welsh works at Landore.

There is not a perpendicular line in any of the cantilevers. In the skeleton towers the bases are 120 feet apart, while the tops are only 31½ feet, and all along the sides slope inwards. The rising members, the members that withstand the compressing, are, as we have said, all tubes. Joining the piers is a tube 12 feet in diameter; rising from this at a right angle, but with an inward batter of 1 in 7½, are the two main members; and in continuation of it is the lower member of the construction, which starts at 12 feet and gradually tapers off till its diameter is but 5 feet. Bracing the two main members diagonally are two flattened tubes of 8 feet in diameter; and midway between the main members and the lower tube rise two struts each of 8 feet in diameter. The junction of all these tubes on the bed plate forms what is known as the "skewback."

The tubes are built of plates. There are six miles of tubes, and forty-two miles of plates to build them with. The cross section of a 12-foot tube shows that it consists of ten plates and ten longitudinal H-beams stiffened at intervals of 8 feet by circular girders made up of diaphragm plates connected to the inner and outer angles, and riveted to the H-beams, while the beams are riveted to the tube plate. The plates are 16 feet long by 4½ feet wide, and from 1⅛ inches to 1¼ inches in thickness; they weigh from 28 cwt. to 32 cwt. each. The H-beams are deep webbed tees and two angles.

In making the tubes the plates were heated in a gas furnace, and bent while hot between dies in a hydraulic press. They ought to have retained their curve, but they did not. As soon as the blocks were removed they would warp longitudinally and bend erratically, one plate sometimes behaving in just the opposite way to its predecessor. Many things were done to prevent this, but in vain, and at last a lot of plates were curved at once and laid one on the other in layers with ashes between, and left to take their chance. When they were cold they were squeezed into shape by another hydraulic pressing, in which the desired result was obtained by using thin slips of iron in just the same way as a printer uses his overlays.



This pressing—the force was that of 1,600 tons between the dies—was done at the works near the Hawes Inn. And not only were the plates pressed, but they were planed and built up into position, and had the rivet-holes drilled before they left the shore. The scene at the yard can, therefore, be imagined. What with planing machines, and dressing machines, and the circular saw cutting slabs of solid steel, and the hydraulic rams justifying plates, and the rams curving angle irons, it would have been remarkable even without the great drilling machines which were its chief feature. The tubes, as we have said, were built up on a mandrel just as if they were in position, but so large were they that, instead of being taken to the workshop, the workshop was brought to them, and travelled along them as they were constructed. This workshop had its own engine and boiler, and its own system of drilling machines; and the travelling annular drill-frames, each with ten drills kept cool

by water jets, bored at a rate that would have sent the inch drills through 280 feet of solid steel in twenty-four hours, and made holes at once through plate and cover and stiffener, so that when erected not a piece would be a hairsbreadth out of position.

In setting out the bridge, which was done by triangulation and a re-survey by the Royal Engineers of their old work on the Ordnance Survey, an error was discovered in the map, and the line was taken further south than was intended; but as the error only amounted to ·79 of a foot, the difference, though regrettable, was near enough to "no matter" to be disregarded. The work was begun all along the line. The viaduct piers at each end were raised to a height of 30 feet, the girders were placed on them, and then the masonry was carried up, taking the girders along with it as it rose. This principle of utilising the permanent work as part of the scaffolding was characteristic of the whole construction.

On the central piers work was started on the lower members, which were built out on the overhang. At the end of each tube a rectangular cage was hung, which carried the riveting machine and the men at work, and had a crane on the top; and parallel to the tube ran a tramway on brackets, which brought the material within reach of the crane. The cage was in six sections; when the tube was completed within it, the two rear sections were taken off and placed in front; when the tube had grown to their limit, the next two sections were transferred in front of them; and this cage system was found to work so admirably that it was very largely adopted. As the bridge grew another plan was introduced. A platform 200 feet long was constructed for each cantilever of temporary girders, strengthened by supplementary trussing made from the links of old Hammersmith Bridge. These platforms, or working floors, were raised by hydraulic power, and consisted of two decks, on the lower of which were the sheds for work and shelter, and on the upper the gantries, cranes, and furnaces.

The furnaces for heating the rivets were oil furnaces, about four feet long, and half a yard wide, doing thrice the work of a coal furnace, and heating nearly 2,000 rivets a day. The work was all bolted into position, and riveted hydraulically. In the smaller work the ordinary hydraulic pincers were used, but for the tubes a new machine had to be devised, in which there were independent rams for the holder and the snap; both worked along girders, so as to obtain the needful resistance, one girder being down the tube and the other outside; the rivet was inserted from the inside, and held in position by the holder, and the snap outside, at 1,000 lb. to the square inch, gave the finishing pressure, and in this way eighty rivets were forced home in an hour.

Difficulties there were as the work went on. The sloping tubes had to be 150 feet high before they could be permanently braced, and their inward batter rendered them in constant need of adjustment by the hydraulic rams. Another source of trouble was in the setting out owing to the unequal expansion and contraction of the various parts of the bridge under the varying temperature; sometimes the centre line of the upper member would be to the east, sometimes to the west, of the true centre; and sometimes the bottom member would be out of the true as it expanded unequally and receded from the sun.

But the bridge continued to grow, carrying the cages and platforms with it in its growth; and when the double line of way came to be put in, with its heavy bridge rails, on longitudinal sleepers, bedded in four steel troughs, into which the wheels ought to fall should they leave the line; and the wind-bracing was fitted in its long diamonds of lattice; and the top junction girder began to get into position, with its auxiliary members; there was such a mass of steel work, permanent and temporary, such frames and floors, and uprights, and horizontals, and such a crossing of hydraulic pipes, and electric cables and ropes for staying and lashing, and running rigging and safety netting, that, instead of part of a bridge, the cantilever looked more like a giant weaver's loom, in which havoc had been played by an earthquake that had hurled it a hundred feet above the stream.

Night and day the work went on, 3,500 men clustering like flies in the steel tangles that rose in a line across the river; men in thick flannel jackets even defying the cold blast of the stormy Forth at midnight in mid-winter, that the progress might be unchecked. And the steel tangles looked more mysterious than ever did the network of a building bridge before, for they stood out cold and clear in all the sharp contrast of dark shadow and brilliant illumination that the electric light alone can give. A hundred arc lamps and five hundred incandescent lamps gleamed on the bridge and in the shops, the largest outdoor installation then at work.

Every modern appliance was taken advantage of to get the bridge completed. There were telegraphs and telephones from shore to shore. There was a daily photographic record of progress. The quiet hydraulic press was brought in to do the work of a hundred noisy hammers; and there were compressors, accumulators, and rams hanging at every point of vantage. There were wire tramways and wire lifts, and there were steam winches and steam cranes, with jibs as manageable as a pelican's neck.

As the cantilevers were built out into space—one balancing the other and trusting to the other for its only support—with the cranes hanging over the furthest extremities, and lifting the material from the boats 300 feet below, the men looked like mice in a mill. They gave the scaling, but the mind failed to realise the colossal size of the structure, though to call it colossal is an insult, for the Rhodian figure could be hung in the waterway with the soles of his feet dangling half his height above high-water mark.

It was only when we were in the wilderness of work that the vastness of the construction was appreciable. The iron cage that looked like a bullet when aloft was found to be big enough for ten people when it dropped to take us up. The

holes in the platforms, in their long series constantly diminishing one within the other, looked like an opened nest of Chinese boxes, and the upper ones seemed much too small to let us pass; but they did! Higher and higher through the holes, deck above deck we went, and when we stood on the top we looked down and caught a glimpse of the water only here and there among the multitude of interlacements. Immediately below us were the screens to catch rivets and hand tools if they fell, as many of them were constantly doing; and further down we could see the covered ways designed to shield the workmen where the screens were missing. And around them, and between us and the river, hung such a complication of pillars and ropes and bars and wires as would never be forgotten.

As we moved outwards, right and left to the ends, it seemed as though our weight would overbalance the beam; but the ends have gone on lengthening, and further stretched their zigzags, and by the great 350-feet central girders have joined faces with the zigzags which stretched out northwards and southwards to meet them from the Queensferrys.

Mr. Arrol has clinched the last rivet, and the bridge is completed. And soon the trains will run and the journey to the north be shortened by an hour. Such is the value of time in these days. All this work for the saving of an hour! Yes, but for the saving of an hour to every passenger that crosses the Forth and to every bale of goods. And the sum of those hours will be considerable.

W. J. GORDON.

## A CRUISE AMONG THE SOUTH SEA ISLANDS.

### II.—PENRHYN ISLAND.

WE next proceeded to Penrhyn Island, or Tongarewa, lat. 9° s., long. 158° w. All the islands we had hitherto seen were in the possession of British firms, populated by island colonists, and under the British flag. We now arrived at the first, properly speaking, inhabited island, and one governed by its own chiefs.

Penrhyn Island is a large atoll, very thickly grown with cocoanuts, of about nine miles diameter, enclosing a lagoon which only small vessels can enter. We anchored off the chief settlement, on the western coast—a village of about three hundred inhabitants. A few roughly-built coral piers afforded landing-places in the lagoon. The people displayed some curiosity on our boat approaching the shore, assembling in numbers at the water's edge, where their bright-coloured dresses lent a picturesque appearance to the scene.

One European lived here, keeping a general store, from which he supplied the natives with provisions and clothing, receiving in payment chiefly mother-of-pearl shells, the gathering of which forms the sole industry of this island. This gentleman introduced us to the three chiefs, one of whom was quite blind—a grey-bearded, venerable figure. These chiefs take it in turn to rule the island, relieving each other at short intervals. In difficult cases the three join in council and give judgment, from which there is no appeal. Punishments, rarely required, are imposed by fines or banishment. Christianity is the religion of the islanders, and its effect on them is remarkable considering that fifty years ago they were almost unapproachable savages. A large, well-built church and a good schoolhouse are maintained, both being conducted by a native missionary or minister trained by the London Missionary Society at Rarotonga. He showed us his institutions with some pride, and refreshed us with a drink of cocoanut-milk. He is supported almost entirely by the natives, and, moreover, collects from them a very respectable yearly sum, which is added to the Society's funds. This missionary has considerable influence in the island; but the morality of the people, in spite of their advantages, is at a low ebb; this was evident to even cursory and casual visitors like ourselves.

We were treated to an open-air concert by the women. They gathered under some cocoanut-trees in an open space, and squatted on the ground in two lines—a motley and picturesque group in their long, wonderfully-coloured gowns. Their black hair hung in two plaited tails down their backs, and in some cases was bound by wreaths of green leaves. One played a flute-like wooden instrument, applied not to the mouth, but to the right nostril, the left nostril being stopped with the forefinger of the left hand, which also held the flute. The fingers of the right hand stopped the notes. The music produced was dismal and unsatisfactory; two wavering notes, devoid of time or expression, formed the only tune played, although more than one performer attempted execution.

The singing was better worth hearing; curious, wild, and barbarous, very unlike the musical part-singing of the Sandwich Islanders. One girl started in nasal melancholy, then the chorus burst in, some taking parts after a fashion, others sustaining a deep note like the drone of a bagpipe; but the whole was distinctly in harmony. A few of the women certainly encroached on the bass register; none of their voices could be called musical according to our notions. The time was perfect, the style quaintly mournful and in a minor key, ending in a long-drawn note.

Encouraged by the applause we bestowed on their singing, the fair performers proceeded to further efforts, this time accompanying their singing with a kind of dance more dexterous than decorous. The lugubrious two-noted flute accom-

panied the proceedings throughout. They were a merry, laughing lot; good-natured, chattering, and friendly. The men, as usual among these people, took no part, but looked on in quiet good-humour.

In type all generally resembled those already met with, but they were considerably less refined in feature than some we had met belonging to other islands. Some of the men were finely built, symmetrical, and muscular; the women as a rule were devoid of beauty, except those who possessed the universal charm of youth.

The natives are expert divers, and are hired for other islands to dive for mother-of-pearl, besides procuring it themselves in their own island. We went out in a boat on the lagoon, and watched some of them at this occupation. The depth of water was not less than ten fathoms, but the diver shot to the bottom without a stone or other weight; and as we looked through a water-glass to escape the ruffling of the surface, we could see his bronze form moving rapidly about over the coral forests and grottoes sixty feet below us. These men sometimes stayed under water as long as two minutes.

Their prowess as divers is only equalled by their skill as fishers, and some of their feats appear incredible, but are related with such authority that there can be no doubt of their truth. Sharks of small size, though sufficiently large to be unpleasant, abound in these lagoons. The natives actually catch them by diving down to where they lie, close to the ground, putting a noose round their tails, and then hauling them on shore. It is solemnly said that they stroke the shark's back while manipulating the noose to lull it, but of course this cannot be verified. The fact remains that the sharks are hauled ashore tied by their tails! Porpoises are caught as follows: The natives pull in canoes outside the island, getting the shoal of porpoises between them and the shore, and gradually close in until the big, foolish fish are driven into the breakers, by which they are thrown on the beach, where the expectant women haul them up.

The following feat of *fishing under water* we ourselves saw performed at Penrhyn Island. A native, stripped to the skin, took in his hand a short line, ending in a hook. This he baited with raw fish, also filling his mouth with pieces of the same bait. He then dived down to within a few feet of the bottom, where numbers of a certain good red fish were basking. Once in the midst of them, he ejected from his mouth the pieces of bait, at the same time drawing his baited hook among them. The hungry fish snapped at the different morsels—including, of course, the baited hook—and in less time than it takes to describe, the diver returned to the surface, a fine fish dangling on his line.

We left Penrhyn Island the same evening, and shaped our course for the Suwarrow Islands, lying considerably to the westward. On arriving there, five days later, we found that the group really consisted of one atoll, but that only portions of the circular reef were above water, thus forming a series of islets irregularly distant, which, with the connecting reef partially submerged between them, enclosed a lagoon of about eight miles diameter. One only of these islets we found to be inhabited, and that by a few emigrant natives employed by the firm already mentioned as possessing Christmas Island. Diving for "pearl" shells was here also their occupation. At the time of our visit operations were suspended to allow the breed of pearl oysters to improve; consequently only three or four natives were living in the place, planting cocoanuts and maintaining the sheds of the establishment. The little settlement was very prettily placed in a grove of cocoanut-trees. A rich grass had been sown round the well-kept buildings, and a few flowers and fruit-trees gave a garden-like aspect to the spot, and varied the monotony of appearance common to the islands already seen.

A few days later, proceeding with our voyage, we arrived at the Harvey Group—two islands, which, with their foundation reef, also form an irregular atoll. A floating population of about thirty natives from the neighbouring island of Aitutaki, whose king claims possession of this group, was occupied in collecting and preparing copra. The usual native missionary (a pupil of the London Missionary Society) was with them, but no white men were on the islands, the natives working solely on their own account. We stayed here but an hour or two, and then shaped course for the island of Atiu.

We had now done with coral islands proper—that is, islands formed of coral alone—and were about to experience changes in scenery and people. The curious lagoon islands already seen had been interesting, not only because of the beauties of their formation, but also as *terræ incognitæ*, being rarely visited by travellers from the outside world, and as showing the industries (in copra, guano, and mother-of-pearl) that have been developed even in these remote spots by the all-absorbing whirlpool of commerce. We now passed on to the group known as the Cook Islands.

# DOROTHY WORDSWORTH.

THE name of Dorothy Wordsworth is inseparably associated with that of her brother. What he owed to her self-denying affection, to her rare intellect, and to her profound love of Nature, the poet has acknowledged in words as familiar as they are beautiful. This "beloved sister," at the most critical period of Wordsworth's early manhood, came to him with the "healing power" which his noble verse has given so largely to others—

> "She gave me eyes, she gave me ears,
> And humble cares and delicate fears;
> A heart the fountain of sweet tears,
> And love, and thought, and joy."

Her influence was abiding. She had herself a poet's soul without his faculty of singing; and to her inspiring sympathy, expended without a thought of self, we are indebted for some of her brother's finest poems. Again and again she expressed the thought, which he uttered afterwards in song; and in prose as well as poetry Wordsworth used Dorothy's mind as if it were a portion of his own. She might have earned a literary reputation of no common order, but all her ambition was centred upon William, and her faith in his genius was unbounded.

Dorothy Wordsworth, the only sister of the poet, was born at Cockermouth in December, 1771, and, having lost both her parents in childhood, lived partly with a relative at Halifax, and partly under the care of her uncle, Dr. Cookson, a canon of Windsor, who, it is said, was a great favourite with the Court. It was not until 1795, when a small legacy left Wordsworth free to follow his own wishes, and to dedicate his life to poetry, that the brother and sister, bent on "plain living and high thinking," kept house together on £70 a year. Their first home was at Racedown Lodge, in Dorsetshire, and there began the acquaintance with Coleridge, which speedily ripened into one of the most memorable friendships recorded in literature. Rich indeed was the poetical fruit which resulted from this intercourse. Coleridge was already a married man, but his "pensive Sara," a good woman, possessed of many admirable qualities, was not, at least in her husband's judgment, sufficiently intellectual to appreciate his genius. It is not surprising, therefore, that Dorothy Wordsworth's sensitive nature and perceptive intellect should have charmed the emotional poet. "She is," he wrote, "a woman indeed—in mind, I mean, and in heart; for her person is such that, if you expected to see a pretty woman, you would think her ordinary; if you expected to see an ordinary woman, you would think her pretty; but her manners are simple, ardent, impressive. In every motion her innocent soul outbeams so brightly that who saw her would say, 'Guilt was a thing impossible with her.'"

In addressing this dear sister in the lines composed near Tintern Abbey, Wordsworth alludes to the shooting lights of her wild eyes, and De Quincey, who was struck by her great sensibility and ardour, also observes that her eyes were "wild and startling and hurried in their motion." In De Quincey's judgment Mrs. Wordsworth was very much more of a lady than her sister-in-law, who "did not cultivate the graces that preside over the person and its carriage."

"On the other hand," he adds, "she was a person of very remarkable endowments intellectually. . . . The pulses of light were not more quick or more inevitable in their flow and undulation than were the answering and echoing movements of her sympathising attention. Her knowledge of literature was irregular and thoroughly unsystematic. She was content to be ignorant of many things, but what she knew and had really mastered lay where it could not be disturbed—in the temple of her own most fervid heart."

In order to be nearer Coleridge, who then lived at Nether Stowey, in Somersetshire, the brother and sister removed to Alfoxden, three miles distant from that place. The house, which they took furnished, was a large mansion, standing in a park containing deer and commanding a beautiful prospect. There was an excellent garden, too, well stocked with fruit and vegetables; and how on an income of less than £100 a year the Wordsworths managed to secure such a country seat, Dorothy does not tell us. But we learn from the report of a visitor that it was hired for a trifle, and that an old woman living in an adjoining cottage attended to the wants of the inmates. It was a fruitful time for poetry, and intercourse with Coleridge was constant. "We are three people," he said, "but only one soul"; and when, two months after leaving Alfoxden, Wordsworth and his sister sailed for Germany, Coleridge was their companion. After a few days spent together at Hamburg, they parted company, Coleridge going to Ratzeburg, and Wordsworth and Dorothy to Goslar, where they had no society, and contented themselves with talking to the people of the house and reading German. On returning to England, some months were spent at Sockburn-upon-Tees, but for a long time they were undecided as to a future residence. At the close of the year 1799 they settled at Grasmere, and from that date the lives of Wordsworth and Dorothy are associated with the Lake country. Having mentioned these few incidents in a career very uneventful, so far as outward circumstances are concerned, it will be well to turn to Miss Wordsworth's own writings for indications of her character.[1]

---

[1] The new and exhaustive biography of Wordsworth, in three large volumes, by Professor Knight, is especially interesting for the copious extracts from Miss Wordsworth's hitherto unpublished diaries; and to these volumes the writer of this paper is therefore largely indebted.

At Alfoxden, Dorothy began her first journal, in which we see already the minute and loving observation of Nature, and the intense joy in natural objects which inspired her brother's poetry. Winter has as many, or perhaps even greater, charms for her than the summer.

"A winter prospect," she writes, "shows every cottage, every farm, and the forms of distant trees, such as in summer have no distinguishing mark," and she observes that a real lover of Nature will find it a pleasure to give winter all the glory he can, since "summer will make its own way and speak its own praises." And yet again brooding on the same theme, she exclaims, "O, thought I, what a beautiful thing God has made winter to be by stripping the trees and letting us see their shapes and forms. What a freedom does it seem to give to the storms." The simplicity and lack of literary effort in Dorothy's journals adds greatly to their charm. Sometimes she is content simply to jot down with an artist's eye for colour what Nature shows her—the oaks thick with feathery sea-green moss, the hollies pendent with their white burden of snow, the springing wheat like a shade of green over the brown earth, the sheep glittering in the sunshine; but often we come upon passages, and these are the most beautiful, which show that Dorothy Wordsworth sees Nature also with a poet's imagination.

The germ of some of Wordsworth's loveliest poems is to be found in her journals. Two years, for instance, before his poem on the Daffodils was composed, Dorothy wrote: "I never saw daffodils so beautiful. They grew among the mossy stones about and above slates; some rested their heads on these stones as on a pillow for weariness; and the rest tossed and reeled and danced, and seemed as if they verily laughed with the wind that blew upon them over the lake; they looked so gay, ever glancing, ever changing." The two were talking one day of the pleasure they always felt at the sight of butterflies. Dorothy said that when a child she used to chase them a little, but that, as she was afraid of brushing the dust off their wings, she did not catch them, and the sister's confession was repeated in the brother's verse. So also was Dorothy's statement that when a child she would not pull a strawberry blossom; and no doubt it was to Wordsworth's perusal of her Grasmere journal, two years after the incident occurred, that we owe "The Leech Gatherer."

"Blessings on that brother of mine," she writes with a sudden burst of affection, and it may be hoped that the loving wish was returned with equal heartiness, for never was poet more richly dowered with a sister's love, and, we fear it must be added, more exacting in his demands upon it.

Before his marriage to Mary Hutchinson, the homeliest household cares devolved upon Dorothy. At the same time, she was her brother's constant companion out of doors, and his amanuensis at home.

"There is no doubt," Professor Knight says, "that their long walks on the mountains, and the utter want of regularity, as to hours for meals, etc.—perhaps an inevitable element in that poetic household—injured the sister's health. The records in her journal (which are not published) giving signs of this are most pathetic; and while her ministry of service to her brother, is one of the most beautiful things recorded in the annals of literature, it may surely be said that the brother should not have accepted so much, and should have noted the injury she was inflicting on herself."

Wordsworth, though abundantly kind when occasion called for it, was not genial, and the Cumberland peasantry thought more highly of Dora. One of them said, "You could tell fra the man's faace his poetry would niver have no laugh in it." He was always "booing about," writing his verses, and, according to a Rydal farmer, "When a man goes in a family way he keeps together wi' 'em, but many's a time I've seed him a takin' his family out in a string and never geein' the deariest bit of notice to 'em; standin' by hissel' and stoppin' behind a-gapin' wi' his jaws workin' the whoal time; but niver no cracking wi' 'em, nor no pleasure in 'em—a desolate-minded man, ye kna. Queer thing that mun, but it was his hobby, ye kna. It was potry as did it."

According to the best local authorities, Dorothy Wordsworth was much more sociable and friendly. "As for Miss Wordsworth," says one of them, "she ud often coom into back kitchen and ask for a bit of oat-cake and butter. She was fond of oat-cake and butter till it, fit to steal it a'most. Why, why, but she was a ter'ble clever woman was that. She did as much of his potry as he did, and went completely off it at the latter end wi' studying it, I suppose. It's a very strange thing now that studying didn't run on in the family."

Strange, indeed, to the rustic mind. A carpenter brings up his son to the trade, why should not a poet do the like?

Dorothy's bright intelligence and genial ways made a stronger impression on the Cumberland peasantry than her brother's verse, for there's "potry as takes a deal of mastery to make out what's said"; but the warmth of Dorothy's heart and the kindness that beamed through her eyes were always easy to understand.

The little cottage at the town end of Grasmere was the poet's home for about eight years, and it was not until four of these years had gone by that Wordsworth married Mary Hutchinson, who had long been the friend both of the brother and sister. "She was the perfect woman nobly planned" and "with something of angelic light" immortalised in the famous lyric, and though, according to most accounts, far from beautiful, was blessed with "a sunny benignity—a radiant graciousness," such as De Quincey states he never saw surpassed. Wordsworth's career, by the way, was full of the happiest incidents, and the good gifts of life fell, as it were, into his lap without much exertion on his part. At a supreme crisis his sister came to comfort and sustain him, and at the very spring-tide of his genius Mary Hutchinson came to add a double blessing to his life. There never was a man more favoured, and one feels sometimes wickedly inclined to ask

whether his satisfaction in his "womankind" was altogether in accordance with their deserts. His affection, no doubt, wore well, like Mrs. Primrose's wedding gown, but of the first and passionate love that gives a new glory to the sky and new witchery to the earth Wordsworth knew nothing. Just before the wedding he started for a tour with his sister, and on the day of the marriage wandered into a churchyard to inspect the tombstones, and, before reaching Grasmere, wrote a poor sonnet wholly unassociated with love or matrimony. The sister's journals would be still more interesting if she were a little alive to her brother's defects, and could enjoy a kindly laugh at his expense. But the sense of the ridiculous and the humour that gives a zest to life were unknown either to Dorothy or William.

To the journals I will now return, for they reveal far more of the real character of the writer than is to be gained from other sources. Her sensibility was so great it was well that household cares, which included making bread and mending stockings, kept her from too much brooding. Sometimes the loveliness of Nature oppresses her, and she can hardly drag herself away, she is so sad; sometimes its solemnity "calls home the heart to quietness;" sometimes there is the simple enjoyment of natural objects, as when she writes, "I sate out of doors great part of the day, and worked in the garden. The little birds busy making love, and pecking the blossoms and bits of moss off the trees. They flutter about and about, and beneath the trees as I lie under them." Often her descriptions are a mere inventory of what she sees jotted down, so that the scene, with its colouring, may be brought once more vividly before her.

Here is an illustration or two. "It was a delightful day, and the views cheerful and beautiful. . . . The colours of the mountains, soft and rich with orange fern: the cattle pasturing upon the hill-tops; kites sailing in the sky above our heads; sheep bleating and feeding in the watercourses scattered over the mountains. They come down and feed on the little green islands in the beds of the torrents, and so may be swept away." And, again—the scene in this instance being viewed from a hill-top near Alfoxden: "The landscape wildly interesting. The Welsh hills capped by a huge range of tumultuous white clouds. The sea spotted with white, of a bluish grey in general, and streaked with darker lines. The near shores clear; scattered farm-houses, half-concealed by green mossy orchards, fresh straw lying at the doors; hay-stacks in the fields. Brown fallows, the springing wheat, like a shade of green over the brown earth, and the choice meadow plots—full of sheep and lambs—of a soft and vivid green; a few wreaths of blue smoke spreading along the ground; the oaks and beeches in the hedges retaining their yellow leaves; the distant prospect on the land side, islanded with sunshine; the sea like a basin full to the margin; the fresh-ploughed fields dark; the turnips of a lively rough green."

During the earlier period of Wordsworth's residence at Grasmere, Coleridge was living at Greta Hall, Keswick a house for ever associated with the memory of Robert Southey. He was dissatisfied with himself and with his wife, who, there can be little doubt, had already good cause to be dissatisfied with him. Dorothy, knowing nothing of the evil that was beginning to blight the poet's life, knew only that he was unhappy and needed sympathy, and her warm heart gave it to him in ample measure. Many were the walks and conversations they had together, and after a visit to Keswick she writes, on returning to Grasmere: "Every sight and every sound reminded me of Coleridge—dear, dear fellow, of his many talks to us by day and by night, of all dear things. I was melancholy and could not talk, but at last I eased my heart by weeping. . . . O! how many, many reasons have I to be anxious for him."

Within a year of Wordsworth's marriage he started, with Dorothy and Coleridge, on a visit to Scotland, Mrs. Wordsworth being unable to accompany them. The "Recollections of a Tour made in Scotland, A.D. 1803, by Dorothy Wordsworth," was published by Principal Shairp in 1874, and is one of the most delightful books of the kind in the language. The obstructions to Scottish travel in those days were not trifling, but Dorothy was untroubled by them. Sometimes food was scarce, and so occasionally were beds. The inns were often dirty and comfortless; often, too, the travellers were drenched to the skin, and struggled on through difficulties unknown to tourists in our day. Samuel Rogers was in Scotland at the time, and met Wordsworth, Coleridge, and Dorothy "making a tour in a vehicle that looked very like a cart." "Wordsworth and Coleridge," he says, "were entirely occupied in talking about poetry, and the whole care of looking out for cottages where they might get refreshment and pass the night, as well as of seeing their poor horse fed and littered, devolved upon Miss Wordsworth. She was a most delightful person—so full of talent, so simple-minded, and so modest!"

In the third week of the tour Coleridge left them, "being afraid to face such wet weather in an open carriage," and in the sixth and last week of the excursion they visited Walter Scott at Lasswade, and afterwards met him at Melrose on his way to the assizes at Jedburgh in his character of Sheriff of Selkirk, and to that town they accompanied him. Then when the business of the assizes was over Scott travelled with the Wordsworths in their car to Hawick, and scarcely passed a house of which he had not some story to tell. "I believe," Dorothy writes, "that by favour of his name one might be hospitably entertained throughout all the borders of Scotland"; and she adds, "We wish we could have gone with Mr. Scott into some of the remote dales of this country, where in almost every house he can find a home and a hearty welcome." And it was not his fame as a poet that made Scott thus welcome, for this was two years before he published the "Lay," but the irresistible charm of manner and warmth of heart which won the love of everyone who had the good fortune to meet him.

A regret has been expressed that, instead of a minute description of outward objects in this Scottish tour, Dorothy Wordsworth had not recorded the conversations between her brother

and Coleridge, but she had not in the slightest degree the art in which Boswell excelled, and it was natural that in keeping a journal never intended for publication she should do that which she felt herself the best qualified to do. The whole record of the six weeks' tour is written with the utmost simplicity. Throughout the volume there is as little indication of literary effort as in the paragraph with which Dorothy concludes her "Recollections":

"Breakfasted at a public-house by the roadside; dined at Sheffield; arrived at home between eight and nine o'clock, where we found Mary in perfect health, Joanna Hutchinson with her, and little John asleep in the clothes-basket by the fire."

The Scottish tour was made, as has been said, in 1803, when Miss Wordsworth was thirty-two years of age. In 1814 Wordsworth visited Scotland again, and on this visit took with him his wife and her sister, leaving Dorothy to keep house at Rydal Mount, the beautiful home to which they had removed in the previous year.

The next fact that broke the even tenor of Dorothy's life was a journey on the Continent in 1820 with her brother and his wife. The two women both kept diaries of this tour, and Wordsworth used them on his return in writing the series of poems which memorialised the tour. "It is hard to say," says Professor Knight, "whether the jottings taken at the time by his wife or the extended journal afterwards written out by his sister is the more admirable, both as a record of travel and as a commentary on the poet's work." Crabb Robinson, a highly accomplished man and a warm friend of the Wordsworths, accompanied them. He also kept a diary, and writes that he did not know when he had felt so humble as in reading Mrs. Wordsworth's journal—it was so superior to his own. He must also have been much struck with Dorothy's, for he advised her to publish it, but she replied, with her usual self-abnegation, that her object was not to make a book, but to leave to her niece "a neatly-penned memorial of those few interesting months of our lives." There was a time, however, when Miss Wordsworth did think of publishing her tour in Scotland, and the poet Rogers was consulted about it. "The fact is," her brother wrote in 1822, "she was so much gratified by her tour in Switzerland that she has a strong wish to add to her knowledge of that country, and to extend her ramble to some part of Italy. As her own little fortune is not sufficient to justify a step of this kind, she has no hope of revisiting those countries unless an adequate sum could be procured through the means of this MS." Rogers thought highly of the "Recollections," and Dorothy wrote to him expressing a hope that the book might produce £200, "a sum," she says, "which would effectually aid me in accomplishing the ramble I so much, and I hope not unwisely, wish for." The wish was never fulfilled, and seventy years passed away before the volume was published by Mr. Shairp.

In September, 1822, Dorothy made a second tour in Scotland with Mrs. Wordsworth's sister, Joanna Hutchinson. The excursion lasted seven weeks, of which three were spent in Edinburgh. Still harping on the Italian journey, Dorothy wrote to Crabb Robinson, three years later, of a scheme for which "all their savings must be heaped up—no less than spending a whole winter in Italy, and a whole summer in moving about from place to place in Switzerland and elsewhere." This project was abandoned, and Miss Wordsworth's next tour was in England, and later on she visited the Isle of Man with her nephew. As usual, she wrote a journal on the occasion, which, if not otherwise remarkable, shows that in approaching old age the faculty of enjoyment was undiminished. This was to be her last pleasure-taking excursion. In 1829 she was keeping house for her nephew, John Wordsworth, then a curate at Whitwick, near Ashby, and there, for the first time in her life, she was taken seriously ill. She recovered slowly, and on her return, by easy stages, to Rydal, had a second attack. Henceforth Dorothy Wordsworth's life was that of an invalid, although for some time she did not altogether give up the hope of restoration to health. Writing to Charles and Mary Lamb, she says, "Wishes I do now and then indulge of at least revisiting Switzerland, and again crossing the Alps, and even strolling on to Rome. But there is a great change in my feelings respecting plans for the future. If we make any, I entertain them as an amusement, perhaps, for a short while, but never set my heart upon anything which is to be accomplished three months hence, and have no satisfaction whatever in *schemes*. When one has lived almost sixty years one is satisfied with present enjoyment, and thankful for it, without daring to count on what is to be done six months hence."

Dorothy's health was a constant grief to her brother. "Her state," he wrote, "weighs incessantly upon every thought of my heart." And in another letter, referring to Coleridge, he says, "He and my beloved sister are the two beings to whom my intellect is most indebted, and they are now proceeding, as it were, *pari passu* along the path of sickness—I will not say towards the grave; but I trust towards a blessed immortality."

Many a year passed away before the end came, for Miss Wordsworth survived her brother, but they were years of sorrow for those who loved her, and especially for him to whom through the glad days of early and later manhood she had proved a second self. Not long before he died, Mrs. Wordsworth said that almost the only enjoyment her husband seemed to feel was in his attendance on his sister, and that her death would be to him a sad calamity.

In 1805 Wordsworth wrote some beautiful lines addressed "To a young lady who had been reproached for taking long walks in the country." His biographer states that they were meant for his sister. If so, the poetical licence in the verses is considerable, for Dorothy was thirty-four, and had little prospect of showing, as a wife and mother,

> "how divine a thing
> A woman may be made."

And unfortunately the prophecy of a serene old age, "lovely as a Lapland night," was not his sister's lot. The long walks for which she had been reproached were one cause, it is thought, of the comparatively early failure of mind and body. When her brother was dying, Miss Wordsworth heard of his condition with composure, and after his death, upon being carried past the door where the body lay, she was heard to say, "O death, where is thy sting? O grave, where is thy victory?" She survived the poet nearly five years, and died at Rydal Mount in January, 1855, at the age of eighty-three. "And now," to quote Mr. Shairp's words, "beside her brother and his wife, and others of that household, she rests in the green Grasmere churchyard with the clear waters of Rotha murmuring by"

JOHN DENNIS.

## "Thank You."

'Comme vous êtes bon . . . . .
"Non, je t'aime,
Voilà tout."
—*Victor Hugo.*

WHY do you thank me, dear,
Say I am kind?
Sometimes, alas, I fear
You must be blind.

Say, does the sun give thanks
To the flowers that lift
Glad faces on hedgerow banks
In the light, his gift?

Are thanks for your right hand meet
When it serves your need?
Do you ever bless your feet
Because of their speed?

Do you thank your eyes that see,
Or your ears that hear?
Then why give thanks to me,
My dear, my dear?

Do you know that you, yes, you,
Are light to mine eyes?
I love you, love you true,
How otherwise?

You let me into your heart,
Do you not know?
You made me of life a part,
A while ago.

What matters what I may do,
Or what I may give?
You know I would die for you,
As for you I live.

Then let me breathe with your breath,
To your need respond,
Till we come to the gates of death,
And the strange beyond.

EMILY H. HICKEY.

## CURIOUS PREHISTORIC BRICKWORK

### IN THE SEILLE VALLEY.

IT has been the custom, since the year 1852, for the various historical and archæological societies of Germany to hold a united meeting in some important centre; and this year the spot chosen for the union of these societies was Metz.

Amongst the various papers read there was one upon a subject which has hitherto received but scant attention from those who strive to probe the history of prehistoric man; a subject which the writer of the paper in question, the Abbé Paulus, goes far to prove to be of strange interest. It gave a curious glance into the lives of our forerunners ere Celt, or Gaul, or Roman had lived their lives and left their traces upon European soil. The title of the paper, "Les Briquetages de la Seille," may be translated, "The Brickwork of the Seille." This Seille is a little river, which visitors to Metz note as swiftly rushing round some of the stupendous walls and gates of that town; and it is in the marshy valleys that border the course of this river that this prehistoric brickwork is found. The little river springs from a small lake not far from the little town of Dieuze, which lies a short distance to the north of Avricourt; and it flows on through a valley oftentimes marshy but fertile. Back in the last century this valley attracted the attention of archæologists; and many down to our own date have written upon its antiquities—one writer, M. Schmidts, quoted by the Abbé, speaking of it as a veritable archæological museum. Five Roman villas have been

discovered there in a distance of twelve miles, Celtic posts *en vedette* on the heights, and important *tumuli;* and what touches the subject of the brickwork, immense masses of this material thrown into the marshes to create a solid foundation.

These bricks or tiles, to which the name of "briquetage" has been given, are of very various form, size, and colour. The different degrees of baking have given to some, colours varying from clayey yellow to a bright red, whilst time and the marshy soil have given to others a green or black coating. Some are smooth, whilst others bear still the impress of the hands of their makers —the marks of the fingers, and upon some even are the markings of the skin. Others have a rough surface, as though from the straw upon which they were probably laid before baking. These curious bricks differ in size as much as in form and colour; the largest vary from ten to thirty centimètres long and three to seven thick. The smallest may be compared to the bones of the finger, and many are extremely small. All these morsels, great and small, have been kneaded and moulded by the hand, baked, and then thrown pell-mell into the marsh without order or arrangement—exactly as we now throw stones to form foundations for breakwaters.

These particles thus thrown together, without any cement, form a substance now so hard that it is difficult to separate it with a pickaxe. Formerly, probably, this mass formed a platform above the marsh, but to-day one has to go deep into the marsh and earth to discover it. In some places it is still nearly on the surface, in others three feet below, and at Vic fifteen to eighteen feet beneath, whilst at Marsal it is covered by twenty-three feet of earth. The immense masses discovered of this "briquetage" are astounding. At Marsal it covers the whole of the town, and nearly the whole of the fortifications, and towards the west stretches beyond them for nearly a thousand feet; and so great is the area covered by it that in the districts of Marsal, Moyenvie, and Burtecourt, a surface is covered of 122 hectares, yielding a mass of no less than two million cubic meters.

The question now comes, Who erected, or rather laid down, this monument, and at what period in the world's history? To the Romans, Celtic Gauls, and prehistoric races has the work been attributed, and for very various purposes—for foundations, for an aqueduct, to protect the issue of salt springs, or for salt reservoirs. But to help unravel this question we must study the various stone and bone tools and arms that have been found in the district. These clearly prove that a population has re ted in this district—perchance then not marsh land, but a shallow lake country—in many points resembling the lake-dwellers in Switzerland and in Ireland. Important Gallic and Roman remains have been discovered above this "briquetage;" but at present the earth beneath has not been properly examined, neither have the masses of the brickwork themselves been carefully searched for articles of the period of their formation. Most certain it is that this enormous work was not all executed at one period. Probably successive races adopted the mode of their forerunners in obtaining solid foundations in marshy soil.

The fact that beneath the "briquetage," as far as it has been explored, no trace of Celtic or Roman remains have been discovered, whilst above it numerous traces of both races are frequent, goes to support what the Abbé upheld—that this work is that of the primitive inhabitants of the district, and that it was executed for two purposes: for foundations, and for the formation of salines for the manufacture of salt. The paper concluded with the hope that the works that are about to be carried out in the valley of the Upper Seille might yield further proofs of the antiquity and uses of this strange and enormous work of a prehistoric era.

Two other subjects were introduced at this congress of historians at Metz, which are well worth the attention of English readers, because they suggest that similar work should be more systematically and energetically carried on by our historians. The Archives Director, Dr. Wiegand, of Strasburg, gave an account of his four months' work amidst the Archives of the Vatican. Though compelled by time to adhere only to a certain period in the thirteenth century, he found a rich mass of material hitherto unknown relating to the history of Lorraine, and especially to the diocese of Metz; and he was able to bring back with him no less than three hundred and forty documents, some of them in full, and the remainder abridged. Another paper illustrated the great value of research amidst the archives of foreign lands for the history of our own country. This was upon the "Acta Nationis Germanicæ Universitatis Bononiensis," by Dr. Knod, who in an interesting manner demonstrated the influence that the University of Bologna had wielded over the history of law in Germany.

Our own history cannot be written without laborious research into the archives of other lands. The Archives of Prague and Bohemia especially would richly repay the searcher for facts upon the history of the English people; and the papers read at the Metz Congress might give a hint to our own Government to do what they can to stimulate research into foreign archives.

# THE MONTYON PRIZE.

## ITS HEROES AND HEROINES.

THE FÊTE DAY.

### JEAN VIGIER.

IT was the *fête* of Madame Vigier, always an event of some importance in the social life of the pretty little town of Aurillac. For not to be included in the *fête*—not, in short, to be on visiting terms with the Vigiers—was to argue oneself unknown and unknowable.

Monsieur Vigier was the owner of extensive ironworks, and was himself the artist of many of the more beautiful designs which made his productions celebrated throughout France. He had also several times filled the office of mayor in his native town, and was altogether a local magnate of the first importance. Madame Vigier, born a Desfaux, took the lead, in her own right, among

the provincial ladies, both from the circumstance of her aristocratic connections and from the wealth of which she had been the heiress. Monsieur and Madame Vigier were kindly and hospitable people, who accepted their position of social pivot without arrogance, and did as much as lay in their power with the greatness thus thrust upon them. They enjoyed spending their money upon their friends as well as upon themselves, and spent it freely, with a certain magnificent disregard of detail which seemed a natural accompaniment of their regal state.

So it came to pass that the *fête*-day of Madame Vigier, on the 15th of July, was always looked forward to as the cream of the summer festivities; while the *fête*-day of Monsieur Vigier, occurring at the beginning of November, ushered in the season of winter gaieties. The former was celebrated always in the country or summer residence of the Vigiers; the latter was the sign of their return to city life for the colder months.

The country house, situated some two miles from Aurillac, on the beautiful Auvergnese hills, had originally been the home of a family even more aristocratic than that of the Desfaux who had occupied it for the last hundred years; and still, with its castellated turrets and huge dove-cots, it presented many characteristics of the antique French château.

But at the moment when we make acquaintance with it, the many-angled rooms and the quaint-terraced gardens, to which flowered farthingales and powdered wigs would have seemed a fitting complement, are absolutely teeming with modern life in the newest of French (provincial) fashions, and noisy with the rattle of many unaristocratic tongues. All the *haute bourgeoisie* of Aurillac is assembled to honour the fortieth birthday of the fair châtelaine, and to enjoy a pleasant summer day's outing.

Before the gates stand a variety of carriages of all sorts and degrees of beauty and shabbiness, provided by the Vigiers for the conveyance of their numerous friends from the town to the château, and now waiting to convey them still further, for the notion has been conceived of celebrating this day by an excursion to a specially beautiful spot among the hills, where an entertainment, called by French Anglophiles a *pique nique*, is to take place. This, however, is in reality a much less risky and unsatisfying repast than that which corresponds to it in the English tongue, since it consists of a well-cooked *déjeuner* partaken of in Christian fashion and ordered a good many days in advance at an hotel, where, according to its own advertisement, ladies and gentlemen receive "every consideration."

But the hour which has been fixed for setting out on this excursion has long passed; the different guests have been assigned to their various vehicles, and still there is delay. A certain buzz, as of sentences suddenly broken off, begins to rise and fall at intervals in the little assembly. Looks of meaning are now and then interchanged. Madame Vigier passes rapidly from one group of her friends and acquaintances to another, and has always the same little speech to make: "It is really very strange that he does not come, but I think we must wait a little longer. My husband—yes, he went to business this morning. Something very important indeed, of course; but he promised faithfully to return by ten o'clock, and now it is past eleven—yes, it is very strange, on this day above all, and he always so punctual!"

At length, when another half hour has gone by, and excitement has worked itself into impatience, and veritable hunger is beginning to add its gaunt quota to the general discontent, a messenger arrives in haste with a note for Madame Vigier. "A letter!" she cries, turning pale. "What has happened?" and her fingers tremble so that she can scarcely break the seal upon which the Desfaux coat of arms is stamped.

Her guests crowd round her.

"What is it?"

"Do tell us!"

"Dear Madame Vigier, have pity on our suspense!"

"What can it be?"

But for a minute or two there is no response except the dead whiteness of Madame Vigier's face, which extends even to her lips; and when she tries to speak a sort of spasm seizes her mouth, and twists it so that her words seem spoken by some other person with a voice altogether strange.

She clutches the letter tight in her hand, and thrusts it in her pocket.

"Something—has happened," she says at last. "Monsieur—my husband, is detained on business. As for the day's amusement, it must be—postponed, my friends."

"Postponed!"

There is a dead silence, followed by a general murmur.

"How dreadful!"

"How vexatious!"

"What can it all be about?"

"Listen," says Monsieur Sers, the notary, cousin to Monsieur Vigier, and himself a big man in his way—"listen, my dear cousin. Keep yourself calm." Then, in a lower tone, "If this is any little misunderstanding between you and Vigier, do not, I intreat you, make too much of it. Let things go on as usual, and no doubt all will work right in time."

"It is no misunderstanding," says Madame Vigier.

"If any accident has happened to our good friend," says the Abbé Azémard, who, as curé of the parish, is also among the guests, "tell me, dear daughter, in what way I may be of use to you or to your husband."

"No accident has come to us," says Madame Vigier, in the same strange, hoarse voice. "It is far worse than that. It is—how can I say it?—dishonour—ruin!" And then, turning away from her crowding visitors, the poor lady wrings her hands like one in mortal agony.

"Tell them to go away. For pity's sake let me be alone," is the only boon she asks.

There is a little consultation in low tones among the assembled groups in the terraced garden.

Presently Monsieur Sers follows Madame Vigier through an open window into the house, whither

she has retreated with such an evident desire for solitude that no one has ventured to intrude upon her. Here, in a little three-cornered boudoir especially devoted to her use, he finds her plunged in tearless sorrow.

"We are all dreadfully grieved about—about this," he says. "But do not be too unhappy; keep up a good heart, cousin. Try and put a good face on it."

"I cannot," says Madame Vigier. "You do not understand—you do not know." And then she takes her husband's letter from her pocket, and reads some few lines of it.

"I dare not meet you all to-day," it runs. "Before evening everyone in the town will know, not only that I am a ruined man, but that I have ruined many who have had confidence in me. Let my name be blotted out and forgotten. You will never see me again." Other words of half-frenzied love and prayers for forgiveness follow, but these Madame Vigier does not read aloud.

Monsieur Sers is mentally thanking his stars that no money of his is invested in Monsieur Vigier's business.

"It is very sad—terrible!" he says. Then, after a moment's silence, "And what is to be done with all these people?" he asks.

"They can go home, I suppose."

"They will spread the news of the disaster far and wide."

"It will soon be known."

"Perhaps not. Matters may be much better than you or Vigier think. In any case, my dear cousin, it seems to me unwise to make too much noise about it. As for the picnic, *you* will not go, of course."

"There must be no picnic."

"Tut, tut, my dear creature! As to that, don't you know the *déjeuner* has been ordered and must be paid for? So, say I, why let the flies have the eating of it? The carriages are all in waiting at the door. I think the best plan will be to pack off all the party as arranged, and keep as cheerful as we can under the sad circumstances."

"Do as you please, then, only leave me in peace!" cries the poor lady. "Peace, did I say? Peace and I will never know one another again!" And, sitting down on a low chair, she buries her face in her hands, while Monsieur Sers steps out again into the sun-lit garden to make arrangements with the eagerly-expectant groups who, on the whole, are more anxious about the *déjeuner*, which seems slipping from their hungry grasp, than anything else.

As he steps out on tiptoe, as if from a chamber of sleep or death, there comes creeping very softly in by the same window a little figure with its finger on its lips and tears in its brown eyes. It is the figure of a little boy about eight years old. He stands for a little while quite still upon the threshold, while the tears roll quietly down his pink cheeks. Suddenly Madame Vigier gives a deep groan, and then the boy, unable to restrain himself longer, runs and throws his arms about his mother, and sobs out his passion of distress on her bosom.

"Maman, maman, what is it?" he cries. "They tell me you are unhappy. But I thought when I looked in that you were asleep, and I was so afraid of waking you. But now you are awake, dear maman, tell me what makes you sad, and let me comfort you."

"Poor little one!" says Madame Vigier, stroking the child's brown hair. "As if thou couldst do anything!"

Just then several ladies who are of the pleasure-party find their way to Madame Vigier, who receives them with such a tearless white face, and with such a stern dignity, that they scarcely venture to offer a word of condolence; moreover, they are, one and all, rather doubtful of the propriety of the step to which they are being urged by their hungry male relatives—namely, of carrying out the original plan of the *pique nique*. After all, the feminine mind is not so much concerned by the affairs of the stomach as is that of the lords of the creation.

Foremost of the group is Madame Sers, who, warned by the well-known tones of an impatient voice outside, tries to expedite both condolences and adieux.

"Sers thinks we had better go for *your* sake," she whispers to Madame Vigier; "but for my own part I would far rather stay and take care of you."

"I will do that," says little Jean, who still holds his mother's hand, and stands by her side like a little page in waiting on a poor dethroned queen.

"Thou, Jean? Nonsense!" says Madame Sers "Thou must come with us; a day's distraction will do thee good. Thou must come with thy brothers, who are eager to be off."

At this moment the head of one of the elder boys appears at the window.

"May we go to the *pique nique*, mother?" he asks. "Monsieur l'Abbé says that father is not ill, or anything—only detained by business."

"Yes, that is so," says Madame Vigier. "Yes, you may go—if you care to."

"Thanks, maman. *Au revoir.*"

And after some few kindly-meant, if not very well-advised, expressions of sympathy and regret, the little group of impatient ladies also take their departure, carrying little Jean off with them by main force. And Madame Vigier is left alone—free now, as she believes, to indulge herself uncontrolled in her despairing grief. She gives way to a passion of sobs, lying with her arms thrown across a table and her face buried in her hands. Weeping unrestrainedly for awhile, she is suddenly startled by hearing the echo of a sob close to her, and by feeling the touch of a warm little hand on her bowed neck.

"Is it you, my child?" she asks, rousing herself. "I—I thought you had gone—with the rest."

"No, no, maman darling," said the little fellow. "I ran back as soon as no one was looking. I did not mean to go. Did I not say I would take care of you?"

This little speech was the keynote of the boy's life.

When Monsieur Vigier's affairs were looked into it was found that, by sacrificing the greater

part of her own fortune, Madame Vigier could redeem her husband's good name. This, without a moment's hesitation, she resolved upon doing. Her own personal inconvenience or suffering seemed absolutely to have no weight with her. She was scrupulous beyond what her friends—and especially her cousin and adviser, Monsieur Sers the notary—considered either necessary or advisable; but nothing less than a full payment of her husband's debts could satisfy her. After all, she had a queenly heart; she had reigned gaily enough in her little kingdom, but nobly, and she would rather have left herself without the price of a piece of bread than have felt that a stain of unfulfilled obligation rested upon the name which had hitherto been honoured by all.

A very few months, then, after the terrible revelation of the *fête*-day the Vigier family were to be found established in a small *appartement* in Aurillac, where, amid the wrecks of former splendour—chiefly received as presents from grateful and admiring creditors—they were prepared to make a fresh start in life. A small, very small, sum of money still remained in Madame Vigier's hands. Monsieur Vigier, who had been induced to return home by his wife's earnest entreaties and energetic action, was already overwhelmed with orders for the artistic designs in which he excelled; the three elder boys were put into positions to earn their own living, and little Jean was, by the Abbé Azémard's interest, admitted as a scholar at the *lycée*, or college, of Aurillac, although he was somewhat under the proper age. But he was a very clever child, and seemed well able to hold his own with boys much beyond him in years.

Altogether, thanks to the brave-souled and devoted wife and mother, the Vigier family seemed to be starting fairly again on a career of honourable, if modest, competence. Madame Vigier's own courage and determination were unflagging, and she held her head as proudly, and did the honours of her tiny third floor with as queenly an air, as that with which in former years she had graced her richly-gilded *salon*.

Upon her husband, however, the effects of their changed fortune were sadly apparent. It would have been better for him, perhaps, had he carried out his original intention of "never being seen again." The effort to take up the old life afresh under such different conditions, and above all with the knowledge that his wife and children had been sacrificed to his thoughtless imprudence, was too hard for him. His health, which had never been robust, now failed altogether, and with it the energy which his new circumstances rendered so necessary.

For a year or two he struggled on, with a white face and a constant cough; and then, growing suddenly weaker, took to his bed, from which he never rose again. Through his long illness he was nursed by his devoted wife with the greatest tenderness; and upon him she expended almost to the last shilling the little sum of money which alone stood between her and absolute want. During this time she endeavoured to eke out their resources by herself earning a little money as a seamstress; but even this last resource was failing, as a new and crowning misfortune began to make itself felt. Her eyesight was becoming very dull, and it was feared, by a doctor whom she consulted on the subject, that before long she would lose it altogether.

So sad were the circumstances of the case, that after Monsieur Vigier's death a meeting was held by two or three of the more intimate friends of the family, to consider what steps could be taken to assist the unhappy widow. But the only result of the consultation was a proposal to get Madame Vigier admitted as an inmate of the asylum for blind and indigent persons.

"It seems to me," said l'Abbé Azémard, who was at the conference, "that amongst us we ought to be able to raise such a little sum as would provide the poor lady with some home more suited to her position."

"As for that, our position is, I imagine, what we are able to support ourselves in," said Monsieur Grostête, who was a well to-do manufacturer, and had been one of Monsieur Vigier's largest creditors. "If I were to be beggared to-morrow, I don't suppose my position of to-day would keep me from starving."

"Of course," observed Monsieur Sers, "one is always extremely sorry for those who fall into misfortune; but really, as for the Vigiers, one may say they brought it upon themselves, and one cannot have quite the same feeling about them."

"*He* may have done so, but surely Madame Vigier behaved in the most noble manner in sacrificing her own fortune," returned the Abbé.

"Umph! well, that is true, in a measure. At the same time, it was all done quite against my advice," said the man of law. "She had no right to strip herself and her children to pay anybody's debts; and if people choose to canter off on those Quixotic hobbies, they need not expect their friends to have much sympathy with the troubles they plunge themselves into. For my own part, I think it was not only absurd, but unfair; and so I believe the sons are beginning to think."

"The sons!" echoed the abbé; "surely they should consider their father's honour as their own."

"Honour I don't know much about," put in Monsieur Grostête, in whose employment two of the elder boys were; "but it is probable they would find their mother's money more useful than their father's reputation. They are good lads enough, and I have done what I could for them. But they are young fellows with their own way to make, and it is not likely they could burthen themselves with the support of a blind woman."

"The little boy Jean is a nice child," said the abbé; "he is doing well at the college, and I mean to charge myself with his future. I should be glad to do something for the mother too, if I could."

"She may be thankful if we can get her an immediate admission into the blind home," said the other; "and if you want to be generous, Monsieur l'Abbé, you might give her a few sous a week to buy sugar."

"I shall be sorry to see Madame Vigier wearing the dress of charity," observed one of the party who had hitherto kept silence; "but I don't see what else is to be done."

"After all," observed another, "that is a mere matter of sentiment, not to be considered by any reasonable person."

The blind infirmary was decided upon, and Monsieur Sers undertook to inform Madame Vigier of the arrangement which was being made for her, and of which, he said, he felt sure she would see the desirability.

Madame Vigier received the news in absolute silence; and Monsieur Sers, who was not a very observant man, did not notice that her hands were rather tightly clasped together, and that the corners of her mouth quivered. It was, of course, a merely sentimental grievance; but a pang did for a moment shoot through the poor lady as she thought of herself in the guise of one of the afflicted beings whom in happier times her alms had often consoled.

"We all think that you will be pleased, and be grateful for the arrangement; and, of course, it is entirely by favour that you can obtain an immediate admission," says Monsieur Sers. "And we are all pledging ourselves to look after the future of the boys."

"Ah, my children!" sighed Madame Vigier; "indeed," she went on, "I am not ungrateful for your interest in us, but it will be a real grief to me to find my poor little home broken up, and to be for ever separated from my sons."

"That is nonsense, my good creature; what use could you be to your sons now? Think of that. You could only be a burthen and a clog on them."

"They ought not to look upon their mother in that light," said Madame Vigier.

"Tut, tut! do not be touchy, cousin; see, I am not touchy—I am not hurt because one of our family has come to live upon charity, though I confess it is a trial to me. But you must be sensible, and learn to look at things reasonably."

"It is less of myself than of my children I am thinking," says the poor mother.

"For that matter, you might have thought of them before, and not been so foolish as to squander your fortune upon a worthless fellow who—"

"Monsieur Sers," returned the lady, with dignity, "my husband was my husband, and he is dead. I am contented to take all the consequences of having acted honestly."

Monsieur Sers rubbed his hand over his bald head thoughtfully. "After all, it is a pity," he said; "as a rule there is too little honesty in the world. Occasionally we find too much. It is a pity it is not more equally distributed among us."

"Perhaps so," said Madame Vigier, a little bitterly.

The arrangements made were at once agreed to by Madame Vigier's three elder sons, who were indeed in no position to maintain their mother in what may be called comfort, and who did not appear disposed to resent the notion of her becoming an object of public charity. A sort of idea had also grown up in their minds, instilled by certain of their acquaintance, that by giving up her money to pay their father's debts she had sacrificed their interests in an unfair manner, and they on their side were not inclined to commit any Quixotisms for the sake of keeping their mother from the poor-house. The only person much moved by the idea was little Jean, the schoolboy.

Monsieur l'Abbé Azémard, his friend and patron, took the trouble to go himself to see the lad, and break what he felt sure would be painful news as kindly as he could.

He found Jean hard at play in the recreation ground, where he was leader of the sports, as in the schoolroom he was at the head of his class.

The abbé drew him aside and told him in a few kind words what was thought best for his mother, at the same time assuring him of the interest he would take in his welfare and progress, as an earnest of which he slipped a twenty-franc piece into his hand.

Jean's face grew very pale and then very red as he listened, and big tears gathered in his eyes. It seemed to him for a moment that he must have swallowed something which had choked him; but he gulped it down, and then, speaking with effort, said,

"Is this what is decided upon?—that my mother is to become a pauper! Can it be possible that my brothers agree to that?"

"Yes, Jean—they have scarcely the means of earning their own living, and they do not see—"

"Stop, Monsieur l'Abbé," cried Jean, interrupting. "Surely they have forgotten me! I will support my mother, I will never let her go to the poor-house."

"You, my dear child, what could you do?" said the abbé, kindly, but smiling. "You are—let me see—how old?"

"Monsieur, I am ten!" said Jean, proudly; "and I will support my mother."

"How?"

"You must let me think a little, Monsieur l'Abbé; but do not fear—God will help me, and I shall find a way. This gold piece you have been good enough to give me I will take, if you will allow me, *as a loan*. Then there is the gold watch you presented me with last year, and some books and other things that I have. Oh! I shall do very well, Monsieur l'Abbé, do not fear."

"My dear boy, all this is very nice, and does you honour, but after all it is mere childishness; you have yourself and your own future to think about. Stay where you are at the school—where you are doing well, and where I promise to look after you. You have the chance here of becoming a clever man. You may be a lawyer, and in time get to be a judge; or you may be an officer, and one day find yourself a great general; or a priest, if you like it better, and end by being a bishop. Then, when you have made your way in the world, you can take your mother out of the asylum, and keep her for the rest of her life."

"But, Monsieur l'Abbé, how many years do you think it would be before I should be a judge, or a general, or a bishop?" asked Jean.

The abbé hesitated. "Umph, well, you are ten years old now, you say. In twenty years, if you are intelligent, you may hope to be occupying a good position."

"Twenty years!"

"Well, say fifteen. Even in ten years' time, you will be a man."

"And my poor mother is to be an object of charity, breaking her heart among strangers, for ten, for fifteen, for twenty years! No, Monsieur l'Abbé, I mean to take care of her *now*."

It was in vain that the abbé pointed out the impracticability, the absurdity of the idea. Jean was not to be turned aside from his resolution. The little child seemed suddenly possessed with the energy, and the force of will, of a man.

"I will go home with you now to my mother, Monsieur l'Abbé," he said; "and we will talk things over. I will see my brothers, and ask them what they mean to do. But if they are unable to take charge of my mother, I *must*."

In the most businesslike fashion little Jean set to work to consider ways and means. His mother's self-possession quite forsook her when she came to understand the manly self-devotion of her youngest child, and she could only clasp him to her breast and rain tears upon his curly head. But Jean gently disengaged himself. "Dear maman, do not cry. There is nothing to cry about. I will take care of you, and God will help us," he said.

The elder lads, unmoved by the touching example of their younger brother, professed themselves unable even to help towards their mother's maintenance, and urged upon her strongly to accept the offer of a refuge in the blind-house.

Madame Vigier herself implored little Jean to allow this arrangement to be carried out, rather than spoil his own career; but at length, borne down by his persistence, and the charm of his clinging affection, she yielded herself to his guidance, the more readily as the Abbé Azémard pledged himself to restore Jean to his studies if "the mad scheme," as he called it, turned out a failure.

"Monsieur l'Abbé," said Jean, "it will not turn out a failure; but I thank you all the same." And Jean was right.

In a very short time the boy had formed his plans. First he realised all of his own that he could possibly turn into money—his watch, his clothes, and his books. This, in addition to the abbé's gold piece, made what seemed to him a sufficient sum upon which to start in business.

He engaged for himself and his mother a small room, into which a kind neighbour carried such poor sticks of furniture as still remained unsold; and then Jean, laying in a carefully selected stock of cakes and sweetmeats, arranged them on a tray and started on his career as a pastry merchant. He had a schoolboy's knowledge of schoolboy tastes, and not being troubled with any foolish pride in the matter, but only with a pride of his own of far deeper nature, he took up his station outside the gates of the college in which he had been a scholar. Here in a very short time he found a ready sale for his goods. Jean was personally known, and, moreover, respected; and though some of the lads were prepared to treat him with scorn and derision, by far the greater number, having heard the story of his determination to fight the battle of life for his mother's sake, approved of him, and, so far as buying goodies went, were prepared to uphold him.

At the end of the first day little Jean found himself what he justly considered rich. He had sold all his goods and doubled his outlay.

"Maman, if we go on like this we shall soon be millionaires," he said, as he poured the sous one after another into his mother's lap.

Every day was, of course, not quite so prosperous; yet, as a rule, little Jean managed to dispose of his purchases to advantage. He frequented not only the college precincts, but he took advantage of the hours when the boys' thoughts were perforce turned into less delectable channels, to make himself known in other parts of the town—in the market place, on the Cours d'Angoulême, and before the doors of the theatre; in short, in all places where he thought it probable that the desires of men, women, or children might run on tarts and sweetmeats. He was untiring; he seemed to be ubiquitous; and, more than all, he contrived to do a very fairly good trade. The confectioner who supplied him, finding him such a regular and punctual customer, was found willing to make special arrangements with him, so that Jean was furnished with a regular succession of special dainties with which to tempt the appetities of his customers.

In the meantime Madame Vigier was able to increase the stock-in-trade by the addition of knitted cuffs and comforters, which she could make very well even with her failing sight; and when winter came these sold rapidly, the money which was gained from them being carefully separated from the rest by Jean, so that it might be devoted exclusively to obtaining some little extra comforts for his mother.

Jean was at last able to pay back the gold piece which he had borrowed from the abbé, and he was so persistent in the matter that the good man felt himself compelled to accept it. But the next morning a watch and a large heap of books were delivered at the boy's lodging. Welcome gifts enough to him, more especially as they were accompanied by a kind and appreciative letter, in which the abbé offered to help Jean on with his studies, if he could manage to devote two or three evenings a week to the purpose. This Jean was delighted to do. He would wait about the door of the theatre till the audience were all seated, then he would deposit his tray of pastry, take his books, and be off for an hour or two's hard study at the abbé's house, returning in time to greet the theatre-goers as they poured out, hungry and tired, from the evening's entertainment.

In this way, keeping up his studies for some years, and snatching every spare moment for reading, Jean managed to acquire an education sufficient for and suitable to the position which he intended to attain—that of a merchant; for of course he had altogether and definitely abandoned, with his college career, any idea of a learned pro-

fession. But he did not intend to remain an itinerant sweetmeat-seller all his life; and when he had been about four years occupied in this way—that is, when he was fourteen years old, and growing a big, strong boy, all the stronger, perhaps, for the active open-air life he led—he determined to enlarge his business.

It was near Christmas time, with Christmas and New Year's presents to be taken into consideration, and having considered them, Jean invested in a small stock of toys—things that could easily be carried, such as balls, tops, marbles, and whistles. For these he at once found a ready sale, and was forced to renew his stock almost daily. Now and again he added other small articles, such as pencils, pens, knives, scissors, and note-books. These he calculated upon disposing of among the college boys, who, though now a new generation, had received Jean warmly as a legacy, and adopted him for their own.

The memory of his noble and disinterested conduct had become a possession of the school of which all the scholars were proud, and Jean was frequently entrusted by them with commissions for larger and more important articles than such as he could carry on his tray. Moreover, they spoke of him to their parents, who were for the most part glad to encourage a youth who had shown such distinguished filial piety. The good name of his mother also stood him in good stead. In short, in one way or another, there was scarcely a person in Aurillac and the neighbourhood who had not heard of Jean Vigier, and who did not regard him with admiration and respect. Under these circumstances it was not surprising that when the Abbé Azémard, who throughout continued to be Jean's kindest and warmest friend, suggested that the boy's name should be forwarded to Paris as a candidate for one of the Montyon prizes of virtue, the notion should be warmly taken up. And the result was that an exceptional sum of 8,000 francs was granted by the French Academy, accompanied by a very gratifying letter of approval.

This large sum of money reached Jean just at the time when he was revolving anxiously in his mind the possibility of getting a settled place of business, and thus affording his mother not only a more comfortable home but also some interest and occupation, for though now completely blind, she had become so handy and able to do things for herself that she was as well qualified to take an active part in life as other people with more sight and less intelligence. But up to the present time Jean had had no means of renting or stocking a shop without running into debt in a manner which was terrible to him to think of. At the same time this was now the one ambition of his life. Night and day his thoughts dwelt upon it, and he would calculate and add up again and again his poor little savings, and rack his brain to think how the thing he so longed for could be done. There was a shop in the High Street of Aurillac to be let—a little shop with two small rooms behind it, which had a special fascination for Jean, and before the closed shutters of which he had many and many a time stood gazing, as though some wonderful sight was to be seen there; but in the end he had always turned away without seeing anything, and always with a mournful shake of the head or a muttered "No, not yet; we shall have to wait."

Now, however, with three hundred pounds and more in his pocket, all doubts and fears vanished, and in a very short time the shutters were taken down from the front of the little shop, and the name Jean Vigier was painted in fine white letters over the window, while the little rooms behind were fitted up by Jean with every sort of comfort and convenience for his mother's use. Jean was now a man of five-and-twenty, arrived at an age when, according to the computation of his old friend the abbé, he might, had he remained at the college, have been entering the higher walks of his profession. One of his former schoolfellows, a son of Monsieur Sers, had just been admitted a member of the faculty of advocates.

"See," said that young man, meeting Jean one day—"see what you too might have become had you stuck to your books."

"True," returned Jean, "but in the meantime my mother might have broken her heart. I prefer my mother to my books, Monsieur Sers."

"Some people have no ambition," returned the young advocate, shrugging his shoulders.

But Jean had not yet reached the full height of his ambition, which in truth was no less than to restore his mother to the position of affluence which she had once occupied; and to this end he steadily applied himself.

It was a work which necessarily involved not only many years of labour, but also the exercise of much self-denial and of great business talent. These two qualities had already been shown in no small degree by Jean Vigier, the boy and itinerant sweetmeat-seller. As Jean Vigier, the merchant, they did not fail him. He had in his progress towards fortune, like most other men, some signal aids and some special hindrances. The chief aid was a not inconsiderable sum of money bequeathed to him by his constant friend the Abbé Azémard, whose death occurred only a short time after he had had the pleasure of seeing Jean in possession of the Montyon prize-money. In his will the abbé said, "I leave Jean Vigier heir to all that I possess, since I know that in his hands money will become a blessing and not a curse."

Among the hindrances which befell Jean in his progress towards wealth was the necessity of helping on his elder brothers, each one of whom received very substantial assistance from him, the elder of the three being received as an inmate into his house, and nursed for several years with much care and tenderness until his death.

Nor was Jean Vigier's benevolence confined to members of his own family. He had a tender heart and an open hand, and showed an especial interest in any young men or women struggling to support the elder members of their families.

Yet he grew rich, and when he died—a bachelor, and having survived his aged mother only a short time—he left a large fortune to be distributed among the charitable institutions of his native town.

L. G. SÉGUIN

# ANIMAL "MANNERS."

BY the word "manners" in this connection I mean good manners, of course. That some animals have very bad manners all who know them must own. Nothing can be worse, for example, on this point, than the behaviour of a pig. See a number of pigs called together to partake of their food. What eager grunts! What a selfish rush! What squabblings and jostlings! What grievous complaints! What a total absence, in short, of all the usual marks of civilisation in feeding! Many years ago a very distinguished artist drew a picture representing a number of pigs feeding together from a trough. All who saw the picture admired it much, and praised it to the skies —all but honest Hodge, a country fellow better acquainted with pigs. "Who ever seed," he said, "pigs feeding together, and ne'er a leg on 'em in the trough?"

I much fear that this observation is just. I fear, also, that it is enough to condemn the race on this question of "manners."

All animals, however, in this respect are not on the level of hogs. Some, on the contrary, exhibit a clear advance on them in regard to this point. Amongst these I always consider that we may give a place to our cows. The hog is so greedy that he thinks of nothing except securing his food. Even when he fights, it is wholly with that object in view. The contest is over as soon as he gets at his trough. And the squabble of to-day, therefore, has done nothing to settle things for to-morrow. But those who know cows know well that it is otherwise about them. You see a herd of them, say nine or ten, scattered here and there in a field. Milking-time has come round. The milkman is at the gate in order to call them away. One by one they seem to catch, and to respond to, the call. They raise their heads, they cease feeding, they slowly converge to the gate. How do they go through? In a definite order, which has been long ago settled between them, and which is now never infringed. "Old Brindle" goes first, "Young Brindle" is next, "Beauty" moves third, "Spot" follows fourth—and so on to the last. I remember these names, and this order among them, in a herd I knew once. And I remember, also, as a boy, with other boys, trying to set this order aside; and what dire confusion and even temporary danger we occasioned thereby! On this matter of precedence cows are as rigorous as the Court Marshal himself.

Not, however, that we can therefore pronounce their "manners" to be altogether the best. As sometimes happens in higher quarters than theirs, there is more of punctiliousness than of true civility, by a good deal, in their conduct. For a better illustration, therefore, let me turn next to the despised "nation" of cats. I knew a cat once which I always regarded as a kind of model cat in this line. At one particular time in the history of the family to which she belonged, its members were under the necessity of occasionally beginning their evening meal without the presence of one of their number, who was engaged elsewhere at that hour. On all such occasions pussy was present, and sat in the absentee's chair. And there she remained, also, with perfect gravity, so long as he continued away. The moment, however, that his well-known knock was heard at the door, and that some of those present began, in consequence, to rise up from their seats, pussy too did her part by jumping down from her own. That was recognition the first. Then, with those that went out, she went out too into the neighbouring hall. That was recognition the second. Then, with those that saluted him, she saluted him also—of course in a way of her own. That was recognition the third. And all this, as I can bear witness, without any "cupboard love" in the matter. Like those others I have spoken of, she gained nothing by the attention she showed. Her supper was safe —she knew that, whether she showed it or not. No! it was only politeness, true politeness, which prompted her conduct. "We are all glad to see you again" — that is what she meant by her "rub."

Let me refer next to another cat deserving similar praise, as I think. This happy pussy may be said to have had the run of two houses at once. The houses in question—which were next door to each other—were inhabited in that cat's time by two families which were very closely connected together—so much so that the houses were furnished, in consequence, with an internal means of communication between them. It was thought well, however, that the particular door which provided this mutual internal access should be a door, as it were, by itself, being so contrived as to require holding open as well as pushing open if anyone wished to go through. So the pussy of those days, and of that double territory, found to be true. Never was that door left open like others. Never also did she find herself able to push it open herself. All she could do, therefore, when she wished to pass through, was to wait till someone passed by; and then, as it were, to try and coax that person to hold it open for her. Often and often, and that very distinctly—as a not infrequent passer-by—was I "asked" this in those days. And often and often did I stop a moment, in consequence, to do as pussy desired. But never did I do so, that I can remember—this is the point to be especially noted—without being thanked for so doing. Whatever her business, whatever the emergency, pussy never omitted, after she had passed through, to stay and give me a "rub." Always she found leisure, that is, to say in effect, "I am much obliged to you for this help." Do all we human beings, even if considered polite, always do as much in our way? We are ready enough, often, to ask favours. Do we always acknowledge them too?

In the case of dogs, again, I have also met with specimens exceedingly "well-bred" in this sense. A certain dog of my own, when I lived in the country—a black-and-tan English terrier, which

went by the name of "Garry"—was quite eminent, indeed, in this way. Like other dogs of the very special sub-breed to which he belonged, it might almost be said of him that he "smiled." Certainly at times he used to move the skin of his countenance, and allow his teeth to be seen, much after the manner in which men do when they indulge in a smile. Certainly, also, we knew he was pleased, as we know the same about them, by the manifestations thus made. Nor was it difficult to discover, further, that Master Garry had a code of his own—like men again—on this point. It was not, on the one hand, on every occasion; neither was it, on the other, to every person, that he condescended to smile. I remember one occasion especially which drew him out, to a special extent, in this line. After being away from home for some days, I had returned rather late to the house, and had gone to my bedroom, being very tired, almost at once; first, however, having taken off my travelling shoes, and leaving them side by side in the hall. The faithful Garry, at the time of my return, was away from the house, having gone out for the day with a brother of mine to whom he was greatly attached. The two came back not long after I had retired to my room. Immediately on the door being opened, Garry caught sight of the shoes. Immediately after he was smelling at them, and capering round them, and twisting himself about, and scuttling and whining, after the frantic manner of dogs. Then, suddenly, he was off and up the stairs and at the door of my room, sniffing there eagerly, and appealing earnestly for leave to come in. This being given by my brother, who had followed him up, he was at the side of my bed in a twinkling, standing up on his hind legs, and gazing up at my face, and whining again, and "smiling" and wagging his tail as though he wished it to come off—I, on the other hand, caressing, and patting, and "poor-dogging" and "good-fellowing" him to the full. After which, but after which only—as though only then satisfied with the amount of attention which he had paid to me as his master on so interesting an occasion as my return to the house—he went to his supper in peace. Hunger second; politeness first—that was his code. I am afraid it is not every dog's code. I am sure it is not that adopted by every man!

But Garry was polite also—and I think more of this much—even to those he disliked. I had a pupil in those days whom we will speak of as Charles. I believe, indeed, that that was his name, though we did not call him thereby. For some reason, I never rightly knew what, he was not a favourite with old Garry. To tell the whole truth, he was not exactly a favourite of my own. I do not think, however—wonderfully quick as dogs sometimes are in discovering and sharing the prepossessions and prejudices of their owners—that this was the true secret of Garry's aversion. I rather imagine that it had arisen from the manner in which Charles had been in the habit of worrying the dog (when in his society) by such a multiplicity of calls and commands, and such an excessive amount of (probably well meant) attention as had interfered sadly with those "private ends" which all dogs of any character, whether sane or insane, generally have in view in their walks. At any rate, whatever the reason, there was no doubt of the fact. Garry did not at all like going out with Charles for a walk. Garry, in fact, would always "get off" it if he possibly could. Knowing this, I was rather surprised, when going out for a walk myself one day, to meet these two ill-assorted companions coming back from a walk. But I was not so surprised, knowing all that I knew, to see in what guise they came back. Charles was walking ahead. Over his arm was a great-coat which he always carried that way, his reason for this peculiarity being (as I was informed) that if the coat was carried in the usual way, on his back, it would have tended to obscure, if not wholly to conceal, the symmetry of his person! Garry came after, apparently wholly blind to the surpassing beauty of the prospect before him, and looking exactly, as dogs often do when disturbed in their minds, as though he expected before long to be hanged. This look, however, was changed in a moment when he caught sight of myself. Over he came to me with a degree of alacrity which said in so many words, "Here's a splendid chance of escape; if you don't mind, master, I'll leave him and accompany you, and let him be hanged in my stead." That this was exactly polite on his part I am not able to say. Poor Charles certainly did not deserve hanging just then. But that Garry also felt this in some measure himself, and was not altogether satisfied himself with his conduct to Charles in this instance, I think he afterwards showed. For the time, he accompanied me in my walk (how could I forbid him?), and for the time seemed also to enjoy himself much, and to be wholly oblivious, in fact, of all matters except those in front of his nose. But when he and I had come back to the house together, as we did after some little time, he seemed then to bethink himself with much seriousness of the past; for, going up at once to where a longish row of great-coats and outer garments were hanging up in the hall, he singled out the very great-coat which Charles had taken out and brought home on his arm, and stood on his hind-legs, sniffing at it as though to make sure. Then, having made sure, he trotted away spontaneously to the pupil-room at the back of the house with a curious mixture of sprightliness and dejection in his demeanour which seemed to convey the idea, "I really feel that I ought to apologise to this disagreeable chap. I fear I *left* him rather abruptly. Perhaps, if I voluntarily *seek* him out now, it will be some sort of amends." Considering the somewhat strained nature of the relations between them, what true politeness there was in that thought!

It ought, perhaps, to be added, to "Garry's" honour, that though this was a special instance, it was by no means a solitary instance, of politeness on his part. A sister of mine informed me quite recently that more than once he had left her in old days when out walking together if they happened to come across the brother before mentioned going out fishing for the day; but that in all such cases Garry invariably singled her out, when he came back in the evening, for attentions

of the most conspicuous kind in the way of wagging and "smiling," as though to make up to her for his previous desertion.

Let me close this paper by making mention of another somewhat similar case. The hero of this was also a dog—a spotted Dalecarlian or coach dog—the property of a well-known livery stable keeper in the small seaside town in which I once lived for a time. As is the case, I have understood, with most dogs of that breed, this particular specimen of it had the reputation of being somewhat surly and unsociable in disposition. On one occasion, indeed, I remember being rather earnestly warned by his owner not to attempt to caress and "pat" him, as I was thinking of doing. "It's not the kind of thing, sir, that he likes. Most probably he will only snap at you if you attempt anything of the sort." This makes the little story I am about to relate the more worthy of note. This surly fellow was found in time—possibly the fact may have accounted in part for his general unsociableness—to have something wrong with his eyes. A veterinary surgeon was, therefore, called in. The dog was suffering from cataract. He would soon be quite blind. An operation was necessary. Should it be done? It was done, and done successfully. "Spotty," in time, was himself once more. "Spotty" was more than himself, in a sense. He now developed qualities and showed intelligence never suspected before. The doctor I have spoken of used to visit the town in which his dog-patient resided about twice in each week. In entering the town, and again in leaving it, he had to cross a particular bridge, which was looked upon by all men as a kind of boundary between the country and town. The dog, on his part, seemed to know this too, and to know the days also—which some of his fellow-citizens certainly did not know—when his benefactor came in. Witness his constant practice, from that time forward, whenever the doctor did so, of meeting him at the bridge. Witness, also, the curious fact that he always then accompanied that doctor all about the town in the professional visits he paid. Witness, finally, that, when these visits were over, he (as it were) saw him off again at that bridge. Many a time have I myself, in a measure, been an observer of this. Many a time have I stood and admired both that doctor and dog—the doctor diligently driving about from place to place in his gig, the dog assiduously keeping company with it, as such spotted dogs do!

The main thing, of course, in this little narrative is the lasting gratitude it displays. Truly beautiful it is to see that poor undemonstrative brute showing his thankfulness thus—truly charming also to see how the kindness done him makes another dog of him, as it were. Unsociable by nature, he values for ever after the society of that man. And yet, for myself, I confess that I admire almost as much the special discrimination he showed. You see our poor friend had to consider his owner as well as his doctor. If much was due to the latter, something was also due to the former. He had to show attention to the one without neglecting the other. He had to be true to his benefactor and to his stables as well. How judiciously he did both! So long as the doctor was engaged in doing good in that dog's own neighbourhood the dog was his attendant throughout. When the doctor leaves that neighbourhood, and begins his return to the country, the dog is at his service no more. The stables, now, are his care, and, therefore, his place. What clear judgment! What well-defined care! What true courtesy, shall we say! Amongst human beings it marks the highest good-breeding to do the right thing towards all. There is nothing better, in fact, in this connection than to "render to all their dues." May we not regard our poor spotted friend as having at least approached to that mark?

W. S. LEWIS, M.A.

## CHINESE MATTING AND ITS MANUFACTURE.

BY JOHN R. JACKSON, A.L.S., ETC., CURATOR OF THE MUSEUMS OF ECONOMIC BOTANY, ROYAL GARDENS, KEW.

CHINESE matting has lately come into very general use, in place of the Indian rush matting and other fabrics previously introduced for floor covering in this country. The manufacture of this matting forms one of the most important industries in China, where enormous quantities are made both for export and for home use.

The plant which furnishes the material for these mats is a kind of rush known to botanists as *Cyperus tegetiformis*, an abundant weed on the muddy banks and in the shallow creeks of the Canton river. The plant is also common in Bengal. In China it is grown in fields, in which narrow channels are made to allow of their thorough watering with the rising and receding tides. The best positions are where the water is brackish but not too salt.

Dr. Hance describes the cultivation of the plant as follows:—"In the 5th moon (June) the young slips are planted, and after one and a half or two months those which have grown are taken up and replanted in rows, as is done with rice. No other care is needed than the occasional weeding of the ground, which is usually manured with bean cake, the marc or refuse of *soja* beans from which the oil has been expressed, a substance largely imported from Northern China as a fertiliser. The plant can be cut on the 5th Chinese moon of the succeeding year, and again three months later, but if only cut once in the year, in the 8th or 9th

moon (October, November), it will attain a height of six to seven and a half feet. In subsequent years the matting plant sends up fresh stems, only requiring to be kept clear of weeds and to be manured; but it gradually becomes coarser and more dwarfed, so that after the lapse of five or six years it is necessary to plant fresh shoots. After being cut down the triangular culms or stems are split in two with a knife and exposed to the sun, the edges, in drying, curling up and meeting together, so that each piece or half section of the culm appears cylindrical in shape. These are sorted according to colour and length and made up into bundles. The paler kinds are reserved for white matting; those of lower quality are dyed."

The cutting of the rushes extends from June to September; those cut in the latter month are the longest and best adapted for the manufacture of the wider musters of matting. The cutting of the rushes is done by men who are well paid from a Chinese point of view, receiving about 250 cash, or about one shilling, per day. The reason of the high rate of pay is that the cutting must be done at the hottest part of the day, and requires to be completed quickly to ensure as much as possible uniformity in the culms. After cutting and splitting, as before described—the last process of which is done chiefly by women and children—the stems are taken to the factory, where they are carefully sorted and made into bundles two or three inches in diameter, and placed in large earthenware jars holding about ten gallons of water, where they are allowed to soak for three days, after which they are taken out and dried in the sun for a day. In their prepared state the stems fetch from one and a half to two taels, or from eight shillings to eleven shillings per picul of 133 pounds English, and are bought up in the country by the matting makers of Canton and other places where the manufacture is carried on.

At the matting factory the stems are roughly sorted by women and children into various degrees of fineness, and afterwards by skilled workmen, the paler culms being used for white matting, and the others being put aside for dyeing. By far the largest quantity of matting made is white, next to this are chequered patterns, and after these innumerable fancy designs.

Of the dyes red is by far the most used. The dyeing is done in wooden vats. The time occupied varies according to the colour, but on an average about three weeks are required, the stems being soaked in the dye three times for about six days each time, and dried after each immersion. This is the case with red dye, which is made of Sappan wood chips in the proportion of fifty pounds to about one hundred and fifty gallons of water. After the water has cooled it is poured into earthen jars, and mixed with two pounds of alum to about forty gallons of the decoction. At the first soaking the dyeing solution is mixed with equal quantities of pure water, the second time with only one-third, and the third time the solution is applied without the admixture of any water.

For producing a yellow dye the flowers of *Sophora japonica*, the "hui-fa" of the Chinese, are used. The dyeing occupies considerably less time than the red, being immersed three times and for three days only each time.

For green dye the leaves and young twigs of a plant known as the "zam-yip," or blue leaf, are used. This plant is at present unknown to botanists. The dye is obtained by soaking the leaves in water and adding alum and sulphate of copper. The process of dyeing green occupies a period of from seventeen to twenty-two days.

Purple, pink, and some other colours are produced by the use of aniline dyes imported from Europe; these are said to penetrate the straw better than native dyes and to produce a faster colour.

The loom used for weaving the reeds is of very simple construction. The warps are made of Chinese hemp two and a half yards in length; the reeds are woven while damp and consequently pliable, a piece of bamboo cleft at one end to hold the reed, which is pushed between the strings of the warp by an attendant at the loom, taking the place of a shuttle. The matting is woven in lengths of two yards and then dried in the sun, and finally over a slow fire. To prevent shrinking it is stretched over a frame, where all irregularities are smoothed down with the hand, the projecting ends of the warp are trimmed down to a length of about three inches, and twenty pieces of matting are joined into one continuous length of forty yards, which forms an ordinary roll.

For shipment the rolls are carefully wrapped in a coarse plain straw mat, and marked and numbered.

A more elaborate form of loom is used for weaving damask mattings. In this process a third assistant is required to regulate the pattern.

The weavers are paid according to the character or fineness of their work. The commonest kinds of matting are woven by young boys, apprentices to the trade, who are paid at the rate of a cent to a cent and a half per yard, while an experienced workman commands as much as five cents per yard for fine work.

The quantity of matting annually exported from Canton is from 100,000 to 120,000 rolls, more than half of which goes to the United States, where cool and light floor coverings are in great demand; the rest finds its way to Europe, South America, Australia, and the Cape of Good Hope. The value of the trade in China is roughly estimated at from half a million to six hundred thousand dollars annually, and in a report on the trade of Ningpo for 1887 it is stated that the export of matting continues to increase.

Chinese matting recommends itself for use in this country for various reasons, not the least of which is its cheapness. Millions of yards are disposed of in this country every season, not only for bedrooms, but also for sitting-rooms, as the matting can be made up and fitted to any sized room like a carpet, and during the summer months it is deliciously cool and agreeable, and is moreover very clean and the designs are both varied and pleasing.[1]

[1] I am indebted to Messrs. Treloar, of Ludgate Hill, for much of the information in this paper, and for the inspection of a series of beautiful Chinese drawings, on native rice paper, showing the rich colours and tasteful designs supplied by the artists for the mat making.

# Varieties.

## School Life in the Black Forest.

BY AN "OLD BOY.'

The majority of parents nowadays, intending a commercial life for their sons, send them abroad to learn German—a language which is now indispensable to a business career. The University towns of Germany are usually chosen as being the most favourable for this purpose, comprising, as they do, all grades of social life, and thus affording ample opportunities of hearing the language as it is spoken by the different classes of society. Some twenty years ago there were probably but few fathers who entertained the idea of sending their sons to learn German in the Black Forest (except perhaps Heidelberg). Now, however, it is different, and the number of boys and girls who have had their education in the Black Forest must be considerable.

A few hours in the train from Strassbourg (*vid* Offenburg) brings one to the foot of the range of hills which have earned their name from the deep colour of the pine woods, which completely cover them, giving them a uniform smooth look like that of velvet, as they stretch away as far as the eye can reach. Here, up a steep zig-zag and drawn by two powerful engines, the train winds in and out of ravines and precipitous valleys in a most confusing manner—sometimes describing a complete circle in a tunnel. Soon after passing Triberg, a very pretty watering-place, the train stops at Somerau. This is the highest point on the line, considerably over two thousand feet above the sea-level. The next station is Königsfeld-Peterzell, a lonely-looking spot, with hardly more than half a dozen cottages in sight. Three miles from here, following the broad, well-kept road through the forest, a village comes in sight, entirely surrounded by pine forests, and apart from which stands out a large, square-looking building.

This little village, the picture of neatness and cleanliness, is a settlement of the religious sect called the "Moravian Brotherhood," and here they have established one of their large schools, which are now so well known in almost every country of Europe. Over two thousand feet above the sea, with the purest air imaginable sweeping up from the forests all round and a naturally invigorating climate, a healthier or more suitable spot could hardly have been chosen. The large building which looks so out of keeping with the rest of the village, is the boys' school, and opposite to it, on the other side of the village—which forms an exact square—stands the girls' school, equally large and ugly.

These Moravians, who labour so hard in the missionary field of Labrador, carry on a no less noble work at home, viz., that of training the minds of the young in the true wisdom of God. Their lives are as simple and happy as they are devoted and energetic, and their system of education is based on religious principles, not of the sentimental but of the true kind, which aims at educating the soul as well as the body. A few particulars of the mode of living in this Black Forest school would, I think, prove interesting to some, and, as one who has lately resided there, I propose to give a short description of it.

We numbered in all some eighty or ninety boys, consisting of English, German, French, Swiss, and a few Italians, and were divided into four rooms for indoor living, over each of which two masters presided. Rising at 5.30 a.m., each room, numbering twenty odd, followed the master at a helter-skelter pace down to the lavatory, where, in deep silence, the process of dressing was completed. Anyone who, through ill-luck, was a minute late either in dressing or leaving the sleeping-room, was put on half-rations at breakfast. This meal was at seven o'clock, and consisted of dry bread and basins of hot milk, which were swallowed (not the basins) at a marvellous pace, those who could eat the fastest devouring more than their share of bread, which was limited to two pieces each. The result of this was a stern decree by which our soppy breakfast was considerably curtailed. Just before breakfast, I should have mentioned the "Prayers," consisting of a portion of Scripture and a hymn.

The morning classes, all conducted in German, were over at twelve o'clock; these were devoted mostly to the study of French, which was thoroughly taught, mathematics, and Scripture history. There were also classes for natural science, and various specimens from the "museum," or lately brought in out of doors, were always at hand, thus making the teaching interesting and practical at the same time.

At twelve o'clock every one took his knife, spoon, and fork in to dinner, and after the usual hot-water soup, cleaned and scraped his plate for the next course. Every alternate Sunday we had a third course, consisting of fruit; and to clean our plates for this luxury a second piece of bread was provided. We English grumbled a good deal at the idea of eating soup, meat, and fruit off the same plate, but after a week or so we looked on it as a matter of course, and took a pride in cleaning our plates better than our Swiss or German neighbour; these, however, always beat us in one point, viz., they devoured the said piece of bread that had performed the sweeping duty; we did not! Of course, we were all so arranged that no two fellow-countrymen should sit together, and be tempted to talk their mother tongue. The punishment for the slightest infringement of this rule was very severe, and it was rarely broken except by newcomers. There was no corporal punishment; and I fancy we dreaded half-rations, walking alone in silence, or copying pages of history in the German characters, more than an occasional flogging.

The food—all-important question—was certainly excellent, though simple; the meat had all the blood squeezed out of it, and was frequently soaked in vinegar; no whims or fads were allowed, and we had to pass up our plates for saurkraut or Strasbourg sausage — ay! and eat it too, whether we would or no. The afternoon classes consisted of history, geography, and various studies in the German language, such as essay writing, grammar, and so forth. At 8 p.m. we ended the day, as we had begun it, with prayer and a hymn, and then retired to the lavatory, where, under the vigilant eyes of our respective masters, we prepared for bed.

Then, amid silent hand-shakings and whispered good-nights, we assembled at the foot of the stairs till the master on duty, urging on some loiterer, led the way up to the sleeping-room. This was at the top of the building, and very well ventilated. We slept on hard little beds, packed close together like soldiers in a barrack, with here and there the larger one of a master. Twenty minutes later all was silent but for the murmured jabberings of the different languages and the stealthy tread of the masters as they paced the room. About eleven o'clock they, too, came to bed, and with them any luckless wights who, as a punishment, had been made to work on at impositions not completed during the day.

Such was, as regards indoor life, our daily routine. The exercise depended upon the season of the year. In winter, arrayed in high boots and with woollen caps to cover our ears—for it was bitterly cold—we used to play football, often in half a foot of snow and on a ground frozen as hard as iron. But our chief delights were sledging and skating, which we enjoyed from December till March, though the snow often remained on the ground as late as May, usually concluding the season with an ice festival or a long sleighing party. In summer we went for charming walks, exploring the beautiful forest glades, which would lead us deep, deep into the almost trackless interior, the glades dwindling down into footpaths, which in their turn grew smaller, and finally running up some monster pine, would leave us lost completely as to our

whereabouts. The monotony of the fir trees was agreeably relieved by a carpet of exquisite mosses, often a foot in thickness. There was an artificial pool near the village, where we used to bathe, all in silence, so far as speaking was concerned. The heat was very considerable, and violent thunderstorms were of frequent occurrence and a great source of danger; every house was provided with several lightning-conductors, and a volunteer fire brigade was in constant practice. Behind the school there was a sandy yard with covered-in galleries on either side for wet weather, and here we spent many a hot half-hour trying—sometimes with moderate though never with exhilarating success—to instil into the foreign mind the art of cricket.

But the events we, one and all, looked forward to with the greatest interest were the walking expeditions. The first of these, called the "Little Journey," we made in the early spring, within the limits of the forest, and spending three days in exploring its beautiful valleys, mountains, and curious little lakes. The effects of light and shadow in the forest depths, when everything was fresh and sweet after the severe winter, were most enchanting. The second tour, the "Big Journey," was undertaken by those boys, chiefly English, who remained at Königsfeld for the summer holidays. It lasted eight days, and we usually went into Switzerland or the Tyrol; now and then a good walking party would get as far as Chiavenna or the Italian lakes. Oh! how intensely we enjoyed those outings, able to converse in our mother tongue and revel in liberty after what we considered very rigid discipline.

The actual school life was very strict; lessons had to be thoroughly mastered or half-rations was the result. The brain was appealed to through the stomach! No one was allowed out of the room without leave, or into the village without a master by his side. On Sunday we were permitted to spend twopence-halfpenny in sweetmeats, which a selected "officer," under the supervision of a master, brought in a basket from the baker's. On Sunday afternoon, too, we were allowed to speak in our own languages. The Church observed many feast-days. On Easter morn, at four, we tramped out, a yawning lot, to the cemetery, where, in the full glory of the rising sun, a short service was held. Theoretically, this was, no doubt, very appropriate, but we differed as to the advisability of putting it into practice. On the last night of the year we assembled in the church, which, by the way, was exceedingly plain and simple. At eleven the preacher commenced his sermon, but, as the first stroke of midnight rang out from the church-tower, the band and organ in the gallery burst forth in triumphant strains, interrupting the discourse of the preacher, and also, I fear, the sleep of several of his listeners! Human nature cannot subsist from 5.30 a.m. to 10.0 p.m. (on bread and milk) without going to sleep!

We addressed all the masters as "Brother," and the females connected with the establishment as "Sister," and certainly they took a brotherly and a sisterly care of us, helping us onward, upward, caring for the soul as well as for the mind.

I feel sure that, of all the men who have spent part of their boyhood in one of the Moravian schools, there can be but few who, on looking back on their simple life there, do not recognise with heartfelt gratitude the unselfish efforts and the devoted labour of the Moravians for their real happiness in this world and the world to come.

ALGERNON BLACKWOOD.

---

### Recent Asiatic Exploration.

At a recent meeting of the Geographical Society of Paris, M. Milne-Edwards, of the Institute, in the chair, M. Venükoff communicated a report of the progress of several Russian expeditions. Colonel Pievtzov had explored a large region of north-west Thibet, starting from Yarkand. Another Russian explorer, Grum-Gvjimailo, had arrived at Kashgar, and was proceeding eastward towards Chinese Turkistan, but had difficulty in obtaining Chinese passports. The Pamir region, Shignan and Badakshan, on the border-land of Russian and Afghan territory, have also been explored. The Russians have political as well as commercial objects in their geographical explorations. The question of Asiatic railways is always under consideration at St. Petersburg. Two lines are now in progress, that of Russian Turkistan, between Samarkand and Tomsk, and the Siberian line between Zlatoust and Vladivostok. The two lines will cross at Tomsk; their total length will be nearly 7,500 miles, including the 900 miles already constructed between Samarkand and the Caspian.

M. Milne-Edwards at the same meeting announced the arrival in Paris of M. Pavie, French Consul at Luang Prabang. He said that M. Pavie had for three years been exploring the north of Siam and the Laotian provinces, with the view of finding the easiest routes between those regions and the sea. He had discovered a route which could be traversed in nine days, four of which would be occupied in navigation, and five on horseback, thus connecting the commercial centres of Siam with the French possessions in Tong King. Another French traveller, M. Bonvalet, accompanied by Prince Henry of Orleans, spent a week at Kuldja, most of the time being devoted to negotiations with the Chinese authorities for the journey to Lob Nor. They left Kuldja on September 6, taking the road by the Yulduz River to Karashar. Hence they would go, by the route traversed in 1885 by Mr. Carey, of the Indian Civil Service, to the once mysterious Lake Lob. From Lob Nor they would travel, possibly by General Prejevalsky's route, across the Altyn Tagh and Chaman Tagh Ranges to the plains of Tsaidam. From Tsaidam, apparently, the travellers cross the range to which Prejevalsky gave the name of Marco Polo so as to strike the upper sources of the Kin Sha Kiang, which river they hope to follow to Batang, the Chinese frontier post on the main road from Pekin to Lhassa. From Batang (printed Bhotan in a Russian paper) they go to Yunnanfu, skirting the China-Tibet frontier, and so onwards to Tonquin.

The indefatigable Dr. Lansdell has been over a vast space, some of it new ground, and will no doubt in due time publish a full description of his last Asiatic travels. In the "Times," at the close of last year, his arrival at Khoten was announced. His friend, Captain Telfer, R.N., in the "Times" of Oct. 22 says he heard from Dr. Lansdell on Sept. 9, on his way home by Hong Kong and Madras. He had travelled after returning from Khoten to Yarkand, "over the Karakoram to Leh, through Cashmere to Pindi; then down through principal towns to Calcutta, and up to Darjeeling and to Katmandoo, in Nepal. Next to Rangoon, Mandalay, Penang, Singapore, Saïgon, Annan, Tonquin, Hong Kong, and Chinese ports to Shanghai, Tientsin, Pekin; thence to Chemulpo and across Corea on horseback, and so to Nagasaki, Kobe, and by rail to Kioto, Tokio, and to Nikko."

We have given many notices in recent volumes about African explorations. This brief summary shows that the geographers and travellers are not neglecting Asiatic regions hitherto little known.

---

**The Comets of 1889.**—Five comets have been discovered during the present year (1889), but of these the last only was visible in any part of the world to the naked eye. It was detected by Mr. Davidson in Queensland, on the 21st of July, and was then nearly as bright as one of the stars in Charles's Wain; but though rapidly moving northerly, it had so much diminished in brightness before it was above the horizon in Europe, that it could no longer be seen without telescopic aid. Its orbit being parabolic, even astronomers will never see it again; and indeed, but one of the comets of 1889 will return to these parts of space. This was discovered by Mr. Brooks at the Smith Observatory, Geneva, in the State of New York, on the 6th of July. Its brightness increased subsequently until it was about three times as great as at the time of discovery, but even so it was not visible without a telescope. It was nearest the sun on the 27th of September, and as it is moving in an elliptic orbit, which it takes nearly eight years to complete, we may look forward to another appearance of it in the summer of 1897. Of the other three comets of 1889, one was discovered (also by Mr. Brooks) on the morning of the 15th of January, but was only seen on that one occasion, so that no determination of its path was possible; two were detected by Mr. Barnard, at the great Lick Observatory in California, on the 31st of March and

the 23rd of June, but they were both faint objects, not to be seen without telescopic aid, and moving in orbits either parabolic or very nearly so, so that they are not likely ever to return to the neighbourhood of the sun.—W. T. LYNN, B.A., F.R.A.S.

**A Surrey Naturalist.**—We regret to record the death of the veteran Surrey ornithologist, Mr. William Stafford, of Godalming. Mr. Stafford was one of a group of self-taught men, village naturalists, two of whom—the late Edward Newman (author of "British Butterflies and Moths") and J. D. Salmon ("Flora of Surrey"), his friends and fellow-townsmen—have become well known through their published works. Mr. Stafford never published anything, but—like the late Mr. Newbould, the eminent botanist—his great local knowledge was chiefly dispensed through others of more literary habits. The vertebrate fauna were his favourite study, and he was the chief authority on the birds of Surrey, of which he has left a magnificent and unique collection, obtained by himself during more than fifty years of observation, and stuffed and mounted in cases with his own hand. He was a skilled taxidermist, a very fair painter of small landscape sketches in oil, and an excellent folk-lorist of his county. His homestead at Godalming, a room in which was for some years occupied by Inskip the painter, was the resort of every naturalist of note who passed through Surrey, desiring to avail himself of the most exact knowledge of the birds and reptiles. His earlier fellow-workers have long since passed away, but there are many who still remember with gratitude his kindness of character and the fulness and freshness with which he gave his knowledge to his many visitors. He reached his eightieth year, tended affectionately by his daughters in his old age. He died peacefully on the 21st September last, and was buried at Godalming.

**Mr. Gladstone on Sunday Observance.**—At the Sunday Observance Congress, held in Paris under the presidency of M. Léon Say, letters were read from President Harrison and Mr. Gladstone. Mr. Gladstone wrote:—"It seems to me unquestionable that the observance of Sunday rest has taken deep root, both in the convictions and the habits of the immense majority of my countrymen. If it appears to many of them a necessity of spiritual and Christian life, others not less numerous defend it with equal energy as a social necessity. The working-class is extremely jealous of it, and is opposed not merely to its avowed abolition, but to whatever might indirectly tend to that result. Personally, I have always endeavoured, as far as circumstances have allowed, to exercise this privilege, and now nearly at the end of a laborious public career of nearly fifty-seven years, I attribute in great part to that cause the prolongation of my life and the preservation of the faculties I may still possess. As regards the masses the question is still more important; it is the popular question *par excellence*."

**Columbus.**—In celebration of the approaching fourth centenary of the discovery of America by Columbus, the centenary committee at Madrid have offered a prize for international competition for the best historical essay on the subject of the discovery and its consequences. Competitors may write in English or in several other specified languages, and must send in their contributions by the 1st of January, 1892. One prize of £1,200 is offered, and another of £600. The terms of competition are published by the committee, and sent to the foreign offices in various countries. It is said that among the illustrious visitors to the United States in 1892 will be the Emperor of China, who proposed to go this year, but was induced to postpone his visit till the grand year of 1892.

**At the Sign of the Seven Stars.**—The Manchester papers recorded the demolition last summer of "the oldest public-house in Great Britain," known for centuries as "The Seven Stars." It had borne that sign for above five hundred years. It was in a densely-peopled part of the city, but latterly blocked with modern warehouses. Formerly there was a subterranean passage from the passage to St. Paul's Church. Withy Grove and Paradise Row are names redolent of the ancient locality. The "Seven Stars" referred, of course, to "Charles's Wain" or "The Plough," the constellation of Ursa Major known by these and many other names. Apart from astronomical use, the Seven Stars appealed more practically to popular use in olden time than since clocks with night-chimes became common. The readers of Shakespeare, for instance, will remember the scene in an early act of "Henry IV." At the inn at Rochester a carrier appears in the yard with a lantern in his hand, and shouts to his mate, "Heigh ho! An't be not four by the day I'll be hang'd: Charles' Wain is over the new chimney, and yet our horse not pack'd. What, ostler!" In literature and poetry there are innumerable references to the Seven Stars in relation to times and seasons, and so familiar a name would well be given in olden days to a resting-place for travellers.

**Mr. Plimsoll's Programme.**—At the Seamen's Congress at Cardiff, Mr. Plimsoll was one of the leading speakers, and he showed himself as zealous as ever in seeking protection for seamen. He advocates: (1) Official checks on overlading; (2) more efficient inspection of laden ships; (3) compulsory water-tight compartments; (4) better food and berths in trading ships; (5) extension of the Employer's Liability Act to shipowners; (6) prevention of undermanning; and (7) reform of marine insurance, so as to allow no ship and cargo to be insured beyond its value.

**Newcastle-on-Tyne in the Days of John Wesley.**—Those who know Newcastle and the Tyne as they now are will read with surprise and amusement an extract from the Journal of John Wesley, under date June, 1750: "After preaching I rode on to Newcastle; certainly, if I did not believe there was another world, I would spend all my summers here, as I know no place in Great Britain comparable to it for pleasantness." A more remarkable testimony to the beauty of the country near Newcastle is the fact that Martin's famous picture of the "Plains of Paradise" is a view of the Gateshead slope and plateau taken from the opposite side of the river, in Benwell parish, three or four miles from the city. When the wind is not from the east, and the smoke of the factories does not obscure the Tyne valley, the view is as lovely as in the days of Wesley and Martin.

**Molokai and the Lepers of the Pacific Ocean.**—"The Honolulu Friend," while giving due honour to the self-sacrificing labours of Father Damien, says that injustice has been done to the Hawaiian Government, which has for many years done all in its power for the relief and comfort of the lepers at Molokai. In a letter from the Rev. W. Wyatt Gill, it is also stated that "it is incorrect to describe that island as a heathen and neglected place before the Roman Catholic Mission. It is one of the most thoroughly and successfully worked stations of the London Missionary Society," and Mr. Gill adds that "many of the lepers are members of Protestant Christian churches, and some of them teachers and preachers of the Gospel."

**German System of National Insurance.**—The plan long under consideration in the German Imperial Councils of national insurance for old age and infirmity among the poor has now been matured, and the law will soon be in active operation. The general principle of the system is to provide a sum payable at the age of seventy to all persons insured, or at an earlier time if incapable of work through accident or infirmity. The funds are provided by contributions levied in early life, supplemented by grants from the State. The details of the contributions levied, and other working arrangements of the system, are given in the Act, a translation of which has been published in this country, and ought to be issued in cheap form. An abstract appeared in the "Pall Mall Gazette" of September 13th. A careful study of this Act will prove of great service in discussing similar systems proposed by Canon Blackley and other advocates of national insurance in our own country. The sum to be provided for distribution is not sufficient to be a complete provision for support, but is only regarded as a welcome supplement to what is available from personal savings, or friendly help from relatives of the aged and infirm. The system is not compulsory for all persons, but is compulsory for those whose contributions can be secured; from those who are in employments yielding certain pay or wages in early years. The arrangements for collection and administration of the funds seem simple, and if found to work as easily as is expected, could be readily and effectively

managed by our Post Office system, which has already, by its admirable organisation, undertaken so many schemes for the benefit of the working classes in the matter of savings banks, insurance, and other provision for age and infirmity. The German system does not interfere with existing benefit or insurance agencies, but supplements their benefits, and the same independence would be secured if any national system were realised in this country. It is estimated that not fewer than twelve million persons will ultimately be benefited by the German national insurance scheme, and the cost of management and administration by the Government would not exceed one shilling per head, or a maximum of £600,000. In England this would be regarded a small amount for so great a national benefit. The German plan is certainly a great step in the direction of State Socialism, and if adopted in England, with requisite modification, would be an important auxiliary to our Poor Law system.

**Millet's Pictures.**—Madame Pommery, the wealthy proprietor of the Champagne vineyards associated with her name, has purchased from M. Bischoffsheim, Millet's famous picture, "The Return of the Gleaners," and has presented it to the Louvre, as a national "solatium" for the loss of "The Angelus," which has passed to America.

**The Emperor of Germany and the Minister of the United States.**—When Mr. W. W. Phelps, the new American Minister, presented his credentials to the Emperor William, he made a short address, expressing his hope that there would be a continuance of the friendship between the two countries. The Emperor received the minister very graciously, and on hearing his speech he replied in English, and with evident warmth of feeling. "From youth," he said, "I have greatly admired the vigorously advancing community of America, the study of whose history has always excited in me a special interest. Among the many qualities of Americans, their spirit of enterprise, their sense of order, and, above all, their inventive genius, arrest the attention of the world. Germans feel themselves the more drawn toward Americans because they are closely connected by many ties of kinship. The prevalent sentiment of the two peoples is that of relationship, which tends to strengthen the friendship between them."

**Hailstones of Extraordinary Size.**—On August 20th, 1889, one of the most terrific hailstorms ever witnessed in Southern Europe broke over Polvelite, near Grusbach, in Moravia. Many of the hailstones which fell were bigger than a man's fist, and weighed 3 lb.; the smallest were as large as hen's eggs. The downpour lasted seventeen minutes, and during that time £100,000 worth of property was destroyed. After the storm, three men, two women, and three children were found dead in the fields, and numbers of people received injuries. The size of the hailstones was great on this occasion, but nothing compared to those of other storms of which there is authentic record. On October 5th, 1831, at Constantinople, masses of ice fell five or six inches in diameter. Generally the form of hailstones is regular, as if the accretion of ice had been gradual before falling; but at other times it appears as if large tracts of vapour are suddenly congealed and masses of ice descend. Some of these have been 20 lb. or 30 lb. weight, and instances have been reported of ice-blocks weighing several cwts. On the 10th July, 1783, a storm occurred over a large part of the south of France, preceded by almost total darkness In one district, out of sixty-six parishes, forty-three were utterly desolated and twenty-three lost half their harvest. Arago, the Astronomer-Royal, estimated the loss from this single storm at 25,000,000 fr. Hail Insurance Companies are common in all parts of rural France.

**Depopulation of France.**—In 1789 France had a population of twenty-nine millions. In 1889 the population is thirty-eight millions. England had in 1789 twelve millions; in 1889, thirty-eight millions. During the century she has moreover sent out above six millions of emigrants to all regions of the world, thereby greatly increasing her influence, wealth, and power. Germany had in 1789 a population of twenty-four millions, five millions less than France; now she has nearly fifty millions, or twelve millions more than France. Russia in 1789 numbered only twenty-five millions; in 1889 her population is nearly one hundred millions, a four-fold increase in a century. The United States of America, thanks mainly to European immigration, has multiplied still more remarkably. In 1789 there were only three millions, now there are nearly sixty millions. France, in 1789 the first in population, has fallen to the fifth rank in numbers! It is still one of the five great nations, but if the present rate continues, France must before long sink to be a nation of second or third rank in power.

This is a serious prospect. If the depopulation, or the disproportional increase, goes on as now, it will be a question not of the strength or supremacy of France, but of its existence as one of the great European powers. In another century Germany will be able by mere force of time, without war or conquest, to subdue France by overrunning the country with waves of population. The increase of foreigners in France is going on with accelerated velocity. In 1873 there were 700,000 foreigners, in 1886 they numbered 1,200,000. It is a peaceable conquest going on, yet an invasion as formidable as that of the barbarians in the fifth century.

The average number in a family is, according to the last census, only three children. The average in other European nations is four or five. In thirty of the Departments, or a third of the whole of France, there is decrease, and increase only in a few, while some of the Departments give an average of only two children in the family. Thus losses are not repaired. Of the causes of this sterility and this depopulation we are not going to speak, leaving that question to physiologists, statesmen, and moralists. But that there are remedies for the evil, and possibilities of a better state of things, we know from the statistics of certain Departments, notably Brittany and those in the central plateau of France, where the population does increase, and where the average of children is four in a family. Still more notable is the increase of the French in Canada. In 1763, when French Canada was ceded to England, there were only 60,000 French; now they number 1,500,000. The English are gradually diminishing in proportion to the increase of the French population in Canada. These French Canadians, the most fertile race in the world, mainly sprang from Normandy, now the most sterile part of the old country. The study of the conditions affecting population may well occupy thoughtful men in France.

**A Novel Pilgrimage to Rome.**—A body of no lesss than twelve thousand working men has been received at Rome by the Pope. The Pilgrimage was organised by Cardinal Langenieux, Archbishop of Rheims, and M. Harmel, a great employer of artisans, and a devoted friend of the Church. His workmen live in a semi-religious fraternity, attending mass every morning, and obeying rules in their community as if they formed a religious order. While so many of the working class in France are socialists of atheistic opinions, the success of M. Harmel's efforts is to be regarded as on the side of order and of religion. We are quite of Dr. Johnson's opinion when he said that "even superstition is infinitely preferable to scepticism." It is at least so in regard to public and social life."

**Bogatzky's Golden Treasury.**—Mr. John Thornton, the philanthropist, whose praise is celebrated by William Cowper, thought that a new English edition of "Bogatzky's Golden Treasury" might be published with advantage. The first edition available in this country was the translation from the German, published in 1754. Of this and subsequent editions a full account is given in Mr. Kelly's recently published "Life of Bogatzky," especially that edition by the Rev. Roger Bentley, of Camberwell; upon whose edition Mr. Thornton worked in making further alterations. In the preparation of his edition Mr. Thornton sought contributions from his friends. Thus, he wrote to Mr. Bull of Newport Pagnell, "Send me a pearl for the 'Golden Treasury' for January 31, on Matthew xiii. 5, 6." He subsequently wrote about this contribution, "I thank you for 31st January pearl, and annotations accompanying it, and I shall hope by a convenient opportunity you will proceed to Feb. 16, 'Let not sin reign, etc.,' Rom. vi. 12. Berridge I will as little spare as Watts, when I think him not more edifying (he refers to some of the verses of Dr. Watts appended to meditations in the former edition). One may find blots on the sun; what we are most used to we like

best. Now, let a Churchman (I don't mean a nominal one) have all the candour you can wish him, yet the church will be uppermost; and so some degree of jealousy (I should better like a softer, prettier name) will arise when he peruses what comes from those of any other persuasion; and this is equally the case with Methodists, Dissenters, Moravians, and others. We all discern it in others, but it is our blind side that is rarely perceived by ourselves." From this letter, quoted by Josiah Bull, in the life of his grandfather, William Bull, it appears that contributions were obtained from various hands. Mr. Josiah Bull refers to "a marked copy" of the book, from which it appears that four original papers were written by William Bull, and others amended by him. Mr. Thornton himself had some; others bear the names of John Newton of Olney, Roger Bentley of Clapham, and others. It would be interesting to see this "marked copy." The Rev. John Kelly, in his "Life of Bogatzky," refers to a copy presented by Lady Lucy Leslie Melville (afterwards Lady Lucy Smith, of Wilford, Nottingham) to Mr. Unwin, son of Cowper's Mrs. Unwin, we suppose. Lady Lucy's mother, the Countess of Leven and Melville, was the only daughter of John Thornton, which accounts for the book being in the hands of the Leven family. An edition has lately been published by the Religious Tract Society, with brief memoir prefixed by Mr. Kelly. After the Bible no book has had wider circulation in Germany than the "Golden Treasury."

**League against Atheism in France.**—A correspondent thus refers to the National League against Atheism lately organised in Paris, to which we recently alluded in the "Leisure Hour": "In the first days of June last year, I noticed in the *kiosques* of the newspaper women and in the hands of the street newsvendors (there are no newsboys here, for all are men) a new weekly journal called 'La Paix Sociale' ('Social Peace'). Thinking it might be another of the socialist papers, I had the curiosity to buy it, and was pleasantly disappointed to read under the title the words, 'Organ of the National League against Atheism.' It contained a manifesto and a programme, the latter signed by a name no less eminent than that of Adolphe Franck, of the Institute, president of the League, the former followed by a list of its officers and honorary members. Among the list I found the names of M. Jules Simon, senator and member of the great French Academy, as honorary president; M. Rousse, of the French Academy, and M. Waddington, of the Institute, as vice-presidents; Baron Turckheim, as member of the finance committee; M. Leon de Rosny, professor in the school of Oriental living languages and in the section of religious sciences at the Sorbonne, as member of the lecture committee; among the honorary members, the Duke de Broglie and MM. Durny and Marmier, all three of the French Academy; a priest, a pastor of the Reformed Church, and a grand rabbi; finally, among the foreign honorary members, Dom Pedro, Emperor of Brazil, and General Tcheng-ki-Tong, Chinese *chargé d'affaires*. This list speaks for itself."

**The Chicago Fire Brigade.**—The volunteer fire brigades in the great cities of the United States are famed throughout the world, and have often been described by English travellers. Captain Shaw, of the London service, some years ago made an official visit to the States, and drew up a valuable report on his return. He speaks with sincere admiration of the number, zeal, and efficiency of most of the corps seen by him, but said that there was a little too much tendency to public parade and "demonstration." This may be found necessary among volunteers to keep up public interest in the service. A very valuable and impartial statement lately appeared from a Frenchman, M. Passy, who was sent by his Government to inspect and report upon educational matters in the States. The terrible catastrophe of the burning of the Opéra Comique and other disastrous fires gave additional reason for perfecting the service of the fire-engines in Paris, and M. Passy's account of what he saw at Chicago, where the organisation is of rare perfection, since the great fire in that city, has attracted much notice.

M. Passy describes the central station, or office, as connected with every fire-station by telegraphic wires. A pair of fine horses are kept always ready at each station, harnessed, and close to the engine. Two men always are on guard night and day. In whatever quarter a fire breaks out, the tidings rapidly reach the nearest station, when the electric button is touched, and the alarm forwarded to the central station. "The horses, on the bell sounding, dart towards the pole of the engine carriage, and by a marvellously-planned arrangement an alarm-bell, by the same mechanism which causes the sound, fastens the traces to the harness, causes the plank on which the drivers sleep in their clothes to tilt over, and the men on to the back of their horses." On the other hand, a board placed at the side of the engine indicates the quarter where the fire has been signalled, which is reached in very few minutes. "I did not time it by my watch," says M. Passy, "but I am sure that the interval between the bell sounding and the start from the station was not many seconds. The whole process was gone through for our inspection, just as at sea an alarm is sometimes given to keep seamen on the alert and to afford practice. We might have imagined that a repetition of the process was about to be given for our satisfaction, but this time it was a real alarm signal that we heard. All was done as I have described, only there was a number shown upon the table indicating the quarter where the fire had begun. In a few seconds the engine was out, and the horses were on the gallop across the city." We learned afterwards that it was not a serious fire, and was extinguished very speedily, thanks to the perfect organisation of the system.

**Mansfield College, Oxford.**—The formal opening of Mansfield College, on the 14th and 15th October, 1889, marks a new era in Oxford. The College is not connected with the University, except by its locality and its purposes, but it is an important event, in so far as Nonconformity now holds a visible and recognised place in academic and theological training at Oxford. The classes and lectures are for theology only, in its several departments, and the College gives no preparatory teaching. The students are graduates already, from various Universities besides Oxford and Cambridge. They will receive training for the ministry in different denominations, but the existing scholarships and fellowships can be held only by members of the Congregational body, to which the foundation is due, the nucleus of the endowment being transferred from Spring Hill College, Birmingham. The Rev. Principal Fairbairn is a Congregationalist. Of the resident tutors, two are Oxford and the other two Cambridge graduates. The speeches of the Master of Balliol, and other eminent Heads of Houses, showed the generous spirit in which the new college is welcomed. There were also distinguished representatives of the Universities of London, Edinburgh, Glasgow, Aberdeen, and of Yale College, U.S.A. The buildings are worthy of Oxford, which is saying a good deal, and high praise is due to the architect, Basil Champneys, a son of the late Dean of Lichfield. The genius of the whole place is well indicated by the statues and the mottoes which adorn the college. High up in the centre of the tower, at the main entrance, is a statue of Milton. Over the gateway is the motto—DEUS LOCUTUS EST NOBIS IN FILIO. Other appropriate mottoes appear in various parts of the building; and the twelve statues which adorn the chapel, executed by Bridgeman, of Lichfield, attest at once the orthodoxy and the catholicity of the founders of the college.

**Shipbuilding in Wood, Iron, and Steel.**—Lloyd's Register was in the habit of preparing for the use of its committee a quarterly return of vessels building and repairing. While a distinction was maintained between the different classes of vessels, sail and steam, steel, iron, and wood, the vessels were dealt with in totals as to number and tonnage. From that statement it appeared that the total number of steamers constructed, or the construction of which was commenced in the years 1885, 1886, and 1887, was as follows:—In 1885, 281, of which 151 were of iron and 130 of steel; in 1886, 194, of which 57 were of iron and 137 of steel; and in 1887, 291, 35 being of iron and 256 of steel. The number of sailing vessels constructed or in course of construction was, in 1885, 116, of which 89 were of iron and 27 of steel; in 1886 the number was 50, 39 being of iron and 11 of steel; while in 1887 the number was 30, 12 being of iron, and 18 of steel. From those figures he drew the following conclusions:—That steel as a material in the construction of vessels is rapidly superseding iron; that sailing vessels, even of the larger type, were found unable to compete with the newest type of

steamer; and that composite and wooden sailing vessels for mercantile purposes had ceased to be built. These results had been brought about within the last few years, and were an evidence of the earnestness with which the British shipowner was ever ready to avail himself of the most approved modes of construction, even although he was thereby depreciating his existing property, for it was true of shipping as of other industries—that to stand still was to go back.—*Lord Brassey.*

**Architectural Politics.**—At Chester Cathedral one of the most extraordinary and significant of the corbel caricatures of statesmen is to be seen on the south-east angle of the south transept. It represents Mr. Gladstone, armed with a long crowbar, with which he is industriously engaged pulling down the edifice of the Church, while Lord Beaconsfield is vigorously endeavouring to prop it up. The artist and sculptor have given a most life-like representation of the two distinguished statesmen. According to Sir Gilbert Scott, the architect, Mr. Hanley, the sculptor, under the sanction of Dean Howson (who was probably unaware of the proceedings), was responsible for this historical illustration.

**Kuroda, Prime Minister of Japan.**—Of Count Kuroda, the new Japanese Premier, the following incident is recorded, showing his generosity towards a fallen foe in his earlier career. The expiring efforts of the retainers of the Shogun, or Tycoon, in the war of 1868, was made in the island of Jeso. Seeing that the game was up, so far as the main islands of the Japanese Empire were concerned, Ennomoto, the commander of the ex-Shogun's fleet, sailed away from Yokohama in the month of October, 1868, with about 3,000 followers. After some delay they reached Hakodate, in Jeso, drove out the officials, and took possession of the place. A Republic was proclaimed, with Ennomoto as head, the various Ministers being elected by the votes of the fighting men. Universal suffrage was declared to be the basis of the Constitution, and later on a President was to be nominated, curiously enough, by the Mikado. These visions were soon dissipated by the arrival of an Imperial force under General Kuroda, who has now been made Prime Minister. After tedious operations, Ennomoto and his force surrendered towards the end of June, although they were aided by certain French naval officers. The Government in Yeddo decided that Ennomoto should lose his head for his conduct, which, I presume, was treated as high treason, inasmuch as he intended detaching a portion of the Japanese Empire from the sovereignty of the Mikado. Kuroda remonstrated against this treatment of his gallant antagonist, and, finding that his representations were of no avail, he declared to the Cabinet that if Ennomoto were executed he (Kuroda) would forthwith commit suicide. As there was no doubt that he would do so, Ennomoto was respited; he entered the Imperial Navy, and subsequently was Ambassador at St. Petersburg, Vice-Minister for Foreign Affairs, and Minister of Marine.

**Munkaczy's Picture of "Christ before Pilate."**—This great picture by the Hungarian painter has also gone to America, having been purchased for 500,000 francs by Mr. Wanamaker, of Philadelphia, a well-known Christian philanthropist, and now Postmaster-General of the United States in President Harrison's Ministry.

**The Free Library Movement.**—It is very satisfactory to note that this movement continues to make steady progress. Between the passing of the first Public Libraries Acts in 1850 and 1879, only 84 districts availed themselves of the Acts. In 1886, when the first edition of Mr. Thomas Greenwood's "Free Public Libraries" was published, the numbers stood at 133, and now it has reached the respectable total of 190. A very large number of towns, and nearly the whole of the villages in the United Kingdom and Ireland, still remain, however, to adopt the Acts, and so establish in their midst these useful institutions.

# Household Queries.

**Temperance Drinks.**—*Can you give me a recipe for a wholesome temperance drink for cold weather, for consumption in places where hot water cannot be obtained?*—To say the honest truth, it has always seemed to us that the desire for temperance "drinks" was rather a sign of weakness, and it sometimes leads to unexpected results. Very recently the Chancellor of the Exchequer stated in Parliament that the Excise had been compelled to stop the sale of certain teetotal drinks on the ground of the alcohol they contained, some of them having more than average London porter; and he added that the experience was that they were popular in proportion to the alcohol they contained. Some lime-juice "cordials" (not all) contain sal volatile, and even ether, both of which are worse stimulants than alcohol; and others iron, which is a most invaluable tonic, but ought to be prescribed by the doctor, and not the grocer. We have the authority of Sir Henry Thompson that nothing is really more "wholesome" than good water flavoured with the juice of a lemon, and a little of the peel to taste, choosing youngish hard lemons, and not soft ones. Sweet drinks are not quite so wholesome. For them there are the many fruit syrups; or you may mix 5 lb. lump sugar, 5 oz. citric acid, and forty drops essence of lemon, in two pints boiling water, stirring till all is dissolved, and straining; add a large spoonful (to taste) to a glass of water. If the liver wants a slight fillip, you may use nitric acid instead of part of the citric, and if iron is needed, some tincture of perchloride of iron, which will give a rough taste; but ask your doctor about either. By the reference to cold, a warm-tasting drink is probably hinted at, or aromatic flavours. Oil of cloves, of carraways, of nutmegs, have all been used; so has pepermint. For mere warmth, capsicums and ginger are the best, and either may be infused in such a family syrup as the above, but the exact selection must depend upon taste. A little gentian or bitter orange-peel will give a bitter tone if preferred. For certain states of stomach bitter and nitric acid are an assistance, *but should not be adopted without advice.* Lime-juice is as wholesome as lemon when it is fresh, which can be known by the taste.

**Burglar Alarms.**—*We are troubled by burglaries in our neighbourhood. Is there any cheap system of alarms, electric or other, available for a lonely house?*—The best and cheapest alarm to neighbours or police is a large hand-bell or policeman's rattle, used out of window, which may be alternated with a policeman's whistle, costing 1*s.* 6*d.* Inside the house, the cost of a "system" is proportionate to the extent. Any electric bell-fitter, and many amateurs, would easily fit a system with a "push" in every room and passage, or as many as desired, any one of which would ring an alarm at the head of the bed occupied by the responsible person, who would then have to use the others when awakened; or at a greater expense it might work directly an electric gong outside, as railway signals are worked. Or it is easily arranged that the opening of any given door leading to valuables will sound an alarm; but in this last case the secret might perhaps become known, and then might be frustrated.

**Washing Art Muslins.**—*What is the best way of washing art muslins to preserve their colours?*—They must be only washed and ironed, and never starched at all; some are better even not ironed, but simply pinned out to dry. No soda must be used, nor even strongly alkaline soap. About a teaspoonful of vinegar to every quart of water, has a considerable effect in keeping the colours from running. The more delicate articles should if possible be put into cold water, and washed speedily one at a time, finishing each off before wetting another.

**Stains in Tablecloths.**—*How can stains of tea, coffee, or fruit be removed from tablecloths?*—Fruit stains should have plenty of salt well rubbed in all over them. at once; then

they will all come out in washing. Coffee and tea stains are best soaked in cold water as soon as the cloth is taken away; if left to dry first they must be soaked in cold water, and soaped and rubbed a little in the same before the ordinary washing treatment; hot water fixes them.

**Worn Leather Bags.**—*Can you tell me of any preparation for renovating a leather bag which is rubbed at the edges?*—Chez-lui would be about the best of the black enamels for such a purpose, or the edges might be blacked with any ink made from copperas. Brown's satin polish also takes on leather pretty well, but soon wears off. Really, it is impossible to make a good job of such things; it is like inking a poor clerk's coat. The dislike to these worn edges has made the natural colour cow-hides so popular lately.

**Smell of New Waterproofs.**—*What is the best way of getting rid of the odour of new waterproof garments?*—It is the keeping them folded flat which retains the odour. Wearing out of doors a few times rapidly removes it, and the same effect will soon be produced by hanging the garment, opened right out and free from folds, in some place where there is a current of air.

**Breakfast Diet.**—*Can you suggest a wholesome variety of food for our breakfast table? The family physician prescribes a good meal at the beginning of the day, but the appetite of some in our house languishes.*—Where strict economy has not to be studied, there should be little difficulty, but it is well, if possible, for the mistress to have in her mind a sort of dietary routine for some ten days or a fortnight. Some cookery books give special chapters on breakfast and supper dishes; in others hints may be got from the list of *entrées*. Presuming that nitrogenous and "relishy" articles are chiefly meant, there is a wide choice in bacon, fried or broiled; ham, ditto and cold; chops and steaks; sausages, hot and cold (the latter not distressing bilious people); pickled pork; cold tongue; *patés* or potted meats (which are quite wholesome if turned out *at once* on opening the tins); sardines; kidneys and sweetbreads; fish fried, or smoked fish broiled; omelettes, and eggs boiled and poached; various kinds of seasoned meat pies. Any of the above may of course be wholesome or unwholesome for different people. The well-known "excellent substitute for butter at breakfast" put *on* butter, may get down another slice, and is most wholesome; dry toast, allowed to get cold, may sometimes be eaten after everything else. If more bulky farinaceous food is desired, and appetite fails for porridge, hominy, or bread-and-milk (which should be attacked first, if at all), potatoes mashed, or cold ones roughly mashed and done with pepper and salt in the frying-pan, will often be eaten with some of the above, and so will tomatoes nicely grilled or stewed. And, finally, it helps along to drink coffee made with three-fourths of boiling milk, making the coffee rather strong, of course.

**Round Games.**—*Can you tell me of a few harmless, sensible round games for young people of from fourteen to eighteen years of age suitable for winter evenings at home?*—Were there more demand on this column than there can be at present, this would be rather too large an order, but as winter is coming on we will do our best. In the same circle games cease to attract unless they furnish some real exercise for the mind; but some which rapidly "use up," may go on by varying the details. There is *Clairvoyance*, for instance, carried on by two players to puzzle the rest, who have to find out how the guesser, who has been out of the room while an object has been fixed upon, knows it from a long catalogue named by the other. This is usually played by the interrogator naming some object with four legs, last before the object meant. Once known to the circle, that is over; but the game may be carried on by the two agreeing on any other signal, and thus it becomes an ever-new exercise of observation. The old and worn-out "I love my love," may take a new interest now and then as "The Parson's Cat," especially if, as far as possible (though it is no part of the rules), humorous or successively contradictory adjectives are sought, thus, "The parson's cat is an angry cat." "I'm sure she is not; she is a most amiable cat." "I beg your pardon; she's an awful cat!" "It's too bad; she is an admirable cat," and so on; T, of course, bringing in Tom and Tabby. Many of Jacques' sets of cards for round games are ever amusing, such as "Happy Families," in which the players have in turn to collect by demands on the others, based at first on guess, and then gradually on memory and inference, the whole family of Pill the Doctor, Bones the Butcher, and so on, from a miscellaneous and at first unknown distribution. Each may go on demanding so long as the player addressed has the particular card demanded. Such games are both amusing, and a really useful exercise of important faculties, especially that of concentrating attention. The old game sometimes known as "Twenty Questions," and sometimes "Man and his Object," in which an outside player has to hunt down an unknown object by specific questions, answered solely by "Yes" or "No," never loses interest if there is skill in finding objects, and is good training for judgment and analysis as well as memory, the inside players also often getting needed lessons as to correctness of statement. It may be varied, and absence out of the room avoided, by any player thinking of the object, and all the others in turn putting the questions. "What is my thought like?" in which every person must give a reason for his random guess when the chooser of the thought has declared it, is another capital game, not worn out in spite of its age. "Throwing light on the subject" is another good game, a word being chosen which has many similar-sounding meanings widely different, as "star." Then either a shut-out player asks each of the rest what the word reminds them of, or each in turn may ask one who has chosen it; the successive answers being based on different meanings, from which the word has to be tracked down. "How, when, and what" is a variety of this idea. Childish as they seem, even the class of games based on the "Do-as-I-do" idea increase the power of observation. Capping rhymes on papers passed round will amuse occasionally, and amusement may be got out of arithmorems and other word-puzzles such as abound in so many papers, acrostics, etc. When a good geometrical puzzle turns up now and then, that will help. The old juvenile geographical tours, played with a teetotum, may assume a new interest if a good map out of the humdrum track be selected and prepared by one of the family; then another, and so on. But the best geographical game is called "Travelling," and needs no apparatus. The first player sets out from—where he likes. He says where he means to go, the conveyances he shall use on the way, what he will buy when there, and to whom he will give it as a present when home again, any error entailing a forfeit; as, if he names a conveyance not used in the locality, or an article not produced, or gives it to an obviously unsuitable person. The second player must start from where the first left off, and so on. Word-making, making as many as possible (or it may be played as getting rid of the most unattached letters) from a certain number of alphabet letters shuffled to each, and the remainder drawn one by one in turn (face downwards) from the pool in the middle, is deeply interesting to many people, and may be varied by giving power to each, as his turn comes, to claim any words from others which he can convert into *longer* words by adding odd letters of his own. We cannot mention various literary games, and have purposely omitted such well-known, childish, and bustling games as the "coach" or "postman" tribe. There are several books devoted to this kind of pastime. It is a good thing to encourage hobbies which can be shared; thus, a lantern and photography will furnish different tasks to half a dozen members of a family.

# SENIOR AND JUNIOR:

## A COUNTRY TOWN CHRONICLE.

BY LESLIE KEITH, AUTHOR OF "GREAT GRANDMAMMA SEVERN,' 'THE CHILCOTES, ETC.

### CHAPTER IX.—TEA AND TATTLE.

MARY KELYNGE BEGS MR. HALLETT NOT TO SEND HER AWAY.

A WEEK or two had now passed since the grave had closed over old Mr. Hallett, and Melchisford still occupied itself with the theme.

"The million in London devour an event and demand another to-morrow," writes Walpole of an age that was even less greedy of novelty than ours; "three or four families in a hamlet twist and turn it, examine, discuss, mistake and repeat their mistake, remember their mistake and teach it to their children." So in Melchisford the genteel world still breakfasted and supped upon the nine days' wonder, and still found room for surmise and conjecture that was a great deal more confident than knowledge.

The whole affair—the old man's sudden end, the uncertainty as to the existence of the young man, who might any day appear to extinguish his cousin's pretensions—had the flavour of mystery that is infinitely more piquant than ascertained fact.

It gave an additional relish to the afternoon tea which Mrs. Smee dispensed to a group of ladies assembled in her drawing-room. Mrs. Smee, whose husband had the health of half the county in his care, was one of the leading ladies of the town, dividing the honours with Mrs. Hallett and Mrs. King, the vicar's wife—a trio that was set apart by virtue of their husbands being professional men, for in Melchisford, as in the greater world, there is a strict line drawn which may not be overpassed.

Mrs. Smee, who was well connected, felt herself a little above her company, but she did not like it the less for that. It was quite well known, for instance, that she was the only person present who habitually had a late dinner. Everyone else had dined at two, and was going home to preside

at the family tea and muffins at six o'clock—but what of that? One must suffer something for fashion's sake, and no lady who respected herself would have missed the five o'clock libation.

"It's a queer thing when you come to think of it," said Mrs. Bartlet, the auctioneer's wife, "Mr. Hallett dying so suddenly as that, all in a minute, as you may say, and never thinking of it himself, or else he would surely have had the decency to die in bed; it almost looks as if—"

"Come, come," interrupted Mrs. Smee, good-humouredly, but with the air of one accustomed to dominate the company, "you surely don't mean to insinuate that the girl murdered him? I am afraid Melchisford isn't equal to a tragedy. Dr. Smee was present at the inquest, and he said there couldn't be a moment's hesitation as to the verdict. Even an Eastshire jury couldn't blunder over it"—she allowed herself the sarcasm.

"Of course we all believe in dear Dr. Smee," said young Mrs. Esher, who was a frequent and paying patient; "some of us wouldn't be sitting here if it wasn't for him."

There was a little murmur of adhesion, and Mrs. Bartlet blushed, feeling that public opinion was against her.

"I only said it was strange," she vindicated herself, "Miss Kelynge being the one to find him and all."

"I daresay she would rather anyone else had found him," said Miss Leigh, who, as the daughter of a deceased vicar, felt herself entitled to be heard. "She looks as if she couldn't manage to kill a fly without trying ever so many times. I saw her the day she arrived—a poor washed-out, red-eyed, scared thing."

"Hush, hush, my dear!" cried Mrs. Smee; "we shall all perhaps be discovering that she is a beauty a year hence."

"The Halletts seem to think her one already, to judge by the way they shut her up," remarked Mrs. King, who was sufficiently mundane in her tastes to enjoy a gossip. "I called at once—of course, as a clergyman's wife it was my duty—but she was invisible. They spoke of the shock to her nerves, and said she was seeing nobody, but I saw her driving with Hester the very next day. We shall be told presently that the Red House people have proved the relationship they are always hinting at."

"We are all related if you go far enough back," said Mrs. Smee, with a laugh. "I don't think our friends at the Red House will be in a hurry to press the claim for a year. An uninteresting young woman with two hundred a year and no social position would scarcely meet their ideas."

"Well, I don't know." Mrs. King pursed up her lips, and looked as if she could impart a great deal if she would. "Young Mr. Andrew called at the vicarage the other evening to ask my husband if he might consult the register; and that white-faced clerk of his has been taking rubbings of the stones in the old burial-ground for a week—"

"Andrew Hallett is a very clever young man," said shrewd Mrs. Potter, "and perhaps it has occurred to him that there are other ways of securing a relation than by making her out to be your cousin."

"We must protect her from his wiles," said the hostess, gaily. "Mr. Andrew mustn't have it all his own way when there are other young fellows in Melchisford who might envy his chances. If only my boy were grown up! But unfortunately he is still in petticoats, and I'm afraid Miss Kelynge wouldn't consent to wait till he becomes alive to the value of his opportunities."

Mrs. Potter, being the mother of two tall sons, found the pointedness of this remark rather offensive. She reddened, and said stiffly, "I daresay if she owns Hallett Place she will have plenty of choice. A girl with money is never without admirers."

"So it is said, but I find for my part that a woman's choice usually depends on what she can get. I tell the doctor that I would never have looked at him if an archbishop or even a dean had turned up; but a country girl, heiress or no heiress, has to be satisfied with anything in the shape of a man that crosses her path, and thankful if she isn't left an old maid," said the little woman who, if she had married the dean, would probably have written his sermons.

"The question is—are we to call?" asked Miss Leigh, who objected to stray from the practical.

Everybody looked at Mrs. Smee, who had risen to serve her guests.

"Am I to give the verdict?" she asked, looking round on her seated audience, and enjoying this evidence of her ascendency. "Well, I should say we ought to call forthwith. It is clearly our bounden duty to be civil to a possible heiress (we can drop her with an easy conscience if she turns out to be the nursery governess), and we must support Mary Hallett. It is a very trying position not knowing whether your egg is going to hatch into an ugly duckling or a swan. I should have gone to the Red House this afternoon but that nurse is busy at this moment trimming my second best bonnet with a bit of black ribbon I happened to have by me. It was a mercy, as I remarked to the doctor at lunch, that I hadn't to buy it, with that risk of the nursery governess in the background."

Melchisford, it will be seen, suffered from no lack of candour in the discussion of its neighbours' affairs, but it did not at all detract from Mrs Smee's enjoyment to know that the voice of criticism was busy with her own fair fame as her guests walked home together. On the contrary, she considered it quite a fair retaliation, and it gave a greater zest to the sketch which she outlined for her husband as she sat with him after dinner while he smoked.

"Emily, Emily, your tongue runs away with you!" said the doctor, laughing in spite of himself. "You ought to consider my position; you will scare away my best patients. Mrs. Potter will go over to Rose; you see if she doesn't."

"No, she won't. You may be very good at curing people's complaints, Henry, but I am cleverer than you at diagnosing their motives. Mrs. Potter will have an illness on purpose—a nice, mysterious, lasting complaint—to call you

in. She knows that those two lanky, red-headed boys of hers can only meet the heroine here; they don't visit at the Red House."

"For goodness' sake, Emily, let me hear no more of that girl!" cried the doctor. "I am sick of the whole affair; I haven't a patient who hasn't worn the topic to death the last week or two. If you won't let her alone, I'll be driven to poison her!"

"I wouldn't—at least, for a year!" laughed Mrs. Smee; "I would establish myself as her private consulting physician. It's the only thing we can do since poor little Harry isn't even in knickerbockers yet. There, see; I've filled your pipe, and if you are very good I will sit by you while you smoke it."

"I won't have you if you go on talking."

"What a monster of hard-heartedness! You shouldn't have brought me to Melchisford, Henry, if you intended to forbid me the study of human nature; there is positively nothing else for a poor woman to do."

Sanctioned by Mrs. Smee's example, Melchisford at once flocked to pay its respects to the young lady at the Red House.

Some of the visitors were fortunate in seeing her, others had to go away satisfied with the knowledge that she was out driving with Hester. Opinions about her varied, but most of the ladies were at one in agreeing that her merits were really very trifling, and that for the owner of such brilliant prospects her mourning was ridiculously dowdy.

"You could see at a glance that it was made at Slipperfield," said Mrs. Bartlet, who got all her "things" from Madame Julia's in town; "it hadn't a scrap of style, and crape a yard deep for a granduncle! That's what these country dressmakers always do, they've no idea of proportion."

"It isn't grief for the granduncle, my dear," said Mrs. Smee, "nobody but a lunatic could mourn for that sour old man; it is a yard deep of gratitude for the chance of sixty thousand a year. If anybody would leave me a quarter of the sum I would cheerfully go about in sackcloth and ashes, and make the doctor do it too!"

"Hester ought to have been the heiress," said her old schoolfellow, Mrs. Esher. "She grows prettier every day, and in that black and white she looks as if she had come straight out of a Paris bandbox."

"Hester will do very well without the wealth," said the doctor's wife; "she will marry a consumptive young curate, and devote herself to dirty children, and never find out to the end of her life that she is a beauty."

On the whole, it gave the visitors a thrill of satisfaction to discover that they could afford to patronise Miss Kelynge, a member of one of the oldest county families, with not a word to say for herself, and with a gown that would disgrace a housemaid.

What mother among them, as she looked at her own daughters, but felt a thrill of gratified satisfaction? Emma and Jane and Mary, with their slim waists and their dresses cut in the latest style that Melchisford knew, with their pink cheeks and their laughing lips—the dear, unsophisticated girls carried off the palm with the greatest ease; there was no fear, at least, that Miss Kelynge would be a dangerous rival when she left off black and appeared at the Corn Exchange dances. And on the strength of this comfortable conviction Mrs. Potter allowed her daughters the new summer jackets they had set their hearts on. Mrs. Barker, on the other hand, put a veto on the chip bonnets with which Matilda and Sophy had hoped to surprise their friends at the coming flower-show, holding Miss Kelynge up as a shining illustration.

"The best people," she remarked, sententiously, "are always the plainest in their dress. As for the Potters, everybody knows that he began life by sweeping out his shop, so there's an excuse for them to be smart."

Of these opposing bests, Matilda and Sophy would no doubt have preferred the new bonnets, but it was well known that Mrs. Barker never spent a shilling where sixpence, "supported by a maxim," would do instead.

It was all very provincial, no doubt, and yet possibly the feelings that stirred the good folk of Melchisford are not wholly unknown in Belgravia, where, as in Dante's "Paradise," there are many grades and degrees and fine distinctions of class, and those on the lower ledge are not always perfectly respectful to their neighbours who have climbed higher.

Perhaps it would have surprised no one so much as Mary Kelynge to know that all this stir and flutter was made about her. She was quite as humble as if her father had handled the besom in the front shop instead of serving her Majesty and dying for his country. She had inherited none of the parental valour, and anybody might have snubbed her without hazarding her resentment. She was a great deal more afraid of Melchisford society than it was ever likely to be of her, and was quite innocently ready to give it the credit of being very genteel indeed.

When it was impressed upon her that she must return all the calls after the lapse of a certain number of days—there is no such strict upholder of etiquette as your little country town—she was almost scared into a real illness.

"Must I go?" she questioned Mrs. Hallett; "wouldn't it do for me to send cards?"

"I'm afraid not," said Mrs. Hallett, hesitating how to frame her reason so as not to give pain. "It is a little place, you see, and we have all known each other for a great part of our lives; people might think—"

"They would think you proud, in short," said Hester, merrily; "that's what mother means, though she doesn't like to say it."

"But I am not proud," cried Mary, with a kind of gasp.

"I know it; if I had thought you were, I wouldn't have dared to be mother's interpreter. You are not proud, and so you must call on everybody."

After that the ordeal, of course, had to be faced; but Miss Kelynge came out of it with so little distinction that Melchisford talked the more, and

hinted that Mr. Hallett must have better grounds than he allowed for supposing her the heiress, else he would scarcely encourage such a wooden young person to linger under his roof.

"He is no more benevolent than the rest of us," said Mrs. Smee to her husband in the privacy of their own room; "even I, who am a very tolerant person, as you know, couldn't find her stupidity the least interesting under a board of £500 a year—"

The doctor was shaving his chin at the moment of this confidence, and he looked round with such a threatening attitude at the introduction of the forbidden topic, that Mrs. Smee prudently fled, and presently made her peace with hot coffee.

Perhaps some hint of the general talk reached the lawyer's ears, for one day, when Mary Kelynge had been his guest for a month or six weeks, he sent a polite request to be allowed to speak with her in his private room.

The summons of course had its terrors for her. She had never felt at ease with the master of the house; his old-fashioned, rather pompous gallantry disconcerted her; his attentions embarrassed her, and now when she found herself alone in his presence she had scarcely courage enough to take the seat he offered her.

The room which Mr. Hallett claimed as his own was a little dark den that looked upon the stable-yard and back premises. All the comfort and luxury of the house seemed to have stopped short at its threshold. It was austerely furnished, an old-fashioned writing-table drawn up to the window, a chair or two, a portrait of Mr. Pitt above the mantelpiece, turning up his nose at the indignity of his situation. It was here that he examined the house and stable accounts; it was here that the servants came twice a year to receive their wages, with a lecture thrown in, perhaps, or a word of condescending praise, according to his mood; it was here that Andrew junior had had chastisement administered to him in his boyhood, after the bracing fashion of the times. Miss Kelynge knew nothing of these associations, but the bald air of the room hinted sufficiently at its uses—nobody was likely to come here for pleasure.

"Sit down, my dear Miss Kelynge," said the lawyer, advancing to meet her as she faltered on the threshold. "I have asked for a word or two with you here, where we shall be quite private and undisturbed. I won't detain you."

Suddenly as he spoke, Mary, who had been drooping and shrinking in her chair as if she were a criminal awaiting sentence, sat up, and actually looked the lawyer in the face.

"Is it about—" she coloured warmly—"have you heard anything of the young man—my cousin?"

He looked at her with an inward wonder that made no record on his face.

"I believe she hopes he will turn up," he said to himself. Perhaps he despised her for a fool, except that it does not come natural for a lawyer to despise a client with so handsome a rent roll. He answered her question at once with becoming gravity.

"We have no news at all; once or twice we have seemed to have a clue, but it has failed so far. My son, I think, has kept you informed of the steps we have taken to find the young man?"

"Yes," said Miss Mary, and found nothing more to say.

"There are of course eleven months, or, to be more exact, ten months and twelve days yet to pass, on any of which he may appear, before you can feel yourself to be undisputed mistress of Hallett Place, and it is about the disposal of your time till then that I wish to consult you. Have you any preference for spending it in one spot rather than another—in London, perhaps, or abroad? Or you might like Hallett Place re-opened, and some young folk there to keep you lively?"

"Must I go to any of these places?"

"Not at all," said the lawyer, with a smile, "you are entirely free to choose. Dr. Shepherd and I are, as you know, trustees, but our control is confined to the management of the property. There is, as you are aware, an ample income set aside for you, and it is for you to decide where and how you would like best to spend it—until matters finally arrange themselves."

"Mayn't I stay here?" she asked, timidly. "I—I have got used to it, and if I am not in the way—"

"My dear young lady," said the lawyer, blandly, "you honour us by the proposal. Nothing would give my wife and me greater pleasure than to offer you a home for the short time that you will require one; but this is a dull place—young people, I hear, find it far from lively. At your age a gayer scene would be more natural—"

"Oh, don't send me away," said Mary, beginning to melt into her pocket-handkerchief; "don't send me away from Hester and Mrs. Hallett and all of you. I should be frightened to death among strangers; oh, please, Mr. Hallett, let me stay."

The lawyer was not very obdurate. Perhaps he did not really wish her to go, but only to ease his conscience by saying to all the world—"She had her free choice, she preferred to remain with us; I could not very well shut the door in the young lady's face."

He insisted, however, that she should take a day or two to think the matter over before finally deciding—as if any amount of thinking was likely to consolidate a mind of her fluid order—and Mary, glad to escape at this price, feebly consented.

When Mr. Hallett came into the drawing-room an hour later there was a preoccupied look on his face which his wife was quick to perceive. She wished he would not busy himself with accounts when the day's work was over. She poured out a cup of tea, and took it to him as he sat in an easy-chair facing the garden.

"Miss Kelynge tells me she is going to remain with us, Andrew," she said, presently.

"Well?" he questioned, with a touch of impatience.

His wife looked at him with some surprise in her mild glance.

"I am very glad for my part," she said; "it is company for Hester, and Mary is no trouble in the world; you wouldn't think she had been brought up as a fine lady—but you—don't you like it? Do you think she will be in the way? She offered to pay a board—"

"Board be hanged!" said Mr. Hallett, angrily. He jumped up suddenly, and walked to the window, looking out rather eagerly, as if at something that had attracted his attention; but when she by-and-by followed him there, aware that she had said the wrong thing, and anxious to make her peace, the landscape was bare of human interest and all untenanted in its twilight beauty.

"Mary," he said at last, and he spoke rather sternly, "remember if she stays with us it must be as our guest—there must be no question of payment or of favour from her. It must all be free—entirely free. She is my ward, and it is as my ward and guest she must remain, if she chooses to stay."

"That is how I should like it best," said Mrs. Hallett, relieved and yet perplexed. "I never gave a thought to a board till she herself mentioned it. Poor thing, she has had a sad, dull life; we must be good to her."

### CHAPTER X.—"WHAT DOES HE MEAN?"

YET five minutes before, when Mr. Hallett went to the window, two figures had been distinctly visible on the lawn. How came it that they disappeared so suddenly, vanishing almost before there was time for recognition?

The night was still and fair; in the little study where Mr. Hallett and his guest had met it had been gloomy enough, the high walls of the court overshadowing it, and the mingled odour of kitchen and stable charging the atmosphere; but in the old garden day seemed to linger loth to go, and night came on with a slow foot. The strong, searching incense of spring flowers filled the serene air, a faint star or two began to show against the pale blue of the sky. It was so benign a night, though it was still but May, that all the windows were wide open, and if the young people had been laughing and chatting on the lawn you could not fail to have heard them.

"Where is Hester?" asked her father, suddenly.

"She is upstairs in her own room," Mrs. Hallett answered, with a little anxious pucker of her placid brow. "It is strange that the child likes to be so much alone."

"Don't she and this other girl get on, then?"

"Oh, yes," said the mother, with a hint of pride; "Hetty is very good to her—Hetty gets on with everybody; but our daughter is clever, Andrew; she takes after you—she has ideas."

"Pooh," said the lawyer, "a woman shouldn't have too many ideas. You mustn't let Hester get any nonsense of that kind in her head; cleverness is all very well for an ugly woman. I wouldn't have crossed the street for you if you had been a clever woman, Mary."

"No," Mrs. Mary acquiesced, quite humbly. She felt somehow as if she were to blame because Hester loved to draw, and read, and dream in the solitude of her own room. She loved her girl none the less dearly that she sometimes wished her a little different—a household fairy, with an apron and a duster, perhaps, and feminine views as to the superiority of man.

The lawyer only gave voice to the general opinion when he summed up against women with ideas. Melchisford was old-fashioned in its prejudices, and had a fine native distrust of feminine ability. Mrs. Smee, the doctor's wife, who was the cleverest woman in it, was more feared than liked. Even little, bustling Tom Howard, who had surgeon-dentist written in big letters on the window over the draper's shop, and who pulled any number of teeth for a shilling apiece, had been heard to say that when he went in search of a wife he wouldn't choose one of your chattering Greek and mathematical women to sit at the end of his table—"as if," cried Mrs. Smee, "the whole of Girton and Newnham were ready to rush at the little monster!"

So Hester was out of the fashion when she preferred study to the dances in the town hall, and her own young dreams and aspirations to the chatter of her girl friends.

"She ought to be here," said her father, with a sharp note in his voice; "it isn't respectful to me; on the few nights when I am at home my daughter ought surely to be here to amuse me."

"I will fetch her," said Mrs. Hallett, going out of the room quickly, the pink a little deeper in her cheeks. In her secret heart she might suffer jealous pangs of all those unshared dreams that Hester wove alone, but she could not bear to hear her blamed. What mother could?

"Miss Kelynge is stupid enough"—she allowed herself to be unjust in her momentary annoyance. "I wonder if Andrew would like Hetty to be like that?"

Hester shut her books, and came down obediently, and played to her father till it became too dark to distinguish the keys. He sat in his chair and listened in a preoccupied fashion; but when Hester paused he motioned her to go on. The music seemed to soothe him and to allay some inward irritation, though he could not probably have distinguished one tune from another.

He did not ask where Miss Kelynge was, because the question would have been superfluous. He knew where she was and who was with her, and while he seemed to be listening to the music his ear was really strained to catch the fall of steps on the gravel of the terraced walk. What did Andrew mean? When two people prefer a dual solitude to company, and the shaded obscurity of woods to the unsheltered lawn, it is not as a rule very difficult to arrive at their meaning. Hester, too, was asking herself what Andrew meant as she played the little tunes her father liked. Could it be that he was falling in love? Even the most just and generous woman finds it a little difficult to estimate aright the attractions of another woman. "What can he possibly see in her?" Is not that the first thing the girls say when Tom falls in love with Kate or Jane? Hester was both

just and generous, but she could not honestly pronounce her new friend very captivating.

"She is very nice, of course," she said to herself, in comprehensive feminine phrase, "and I like her very much indeed; but I should have fancied Andrew would have preferred a livelier disposition, and a prettier face. I don't think he can be in love—unless—unless—"

She reined in her fancy sharply at this juncture, however, and would not permit it to wander any further in a forbidden direction. She played louder to silence its whispers, and, under cover of the vigorous chords, the two culprits stepped in at the open window.

It was much too dark to see Miss Kelynge's blushes, but it was easy to discover by the frightened tremor of her voice that she felt herself to be a little in disgrace.

"My dear young lady," said Mr. Hallett, rising to give her his chair, "do you think you are wise to risk the night air without a wrap to protect you?"

"I—I didn't think of it," faltered Mary.

"It is my fault," said Andrew, from the window. "I took Miss Kelynge down to see the new plantation by the lower pond. We expected Hester every minute to join us laden with shawls. Hetty is so afraid of anyone catching cold, I even expected her to bring my great-coat."

Hester paused in her playing, but she said nothing.

"Why, dear, you won't take any harm," said comfortable, unsuspicious Mrs. Hallett; "the air is as mild as milk. But if you should feel the least hoarseness, you know, Barnes shall make you a hot drink and bring it to you when you are in bed. There's nothing like taking a hot drink in time—"

"It is time for prayers. Ring the bell, Mary," said the master, cutting short these benevolent offers rather unceremoniously.

So the lamps were lit, and the servants flocked in and the books were opened. Mr. Hallett was not very often at home to conduct the family worship, and so the ceremony lost none of its impressiveness. He read (as many people do) in a tone of voice reserved peculiarly for the Bible—at once solemn and drawling. Andrew junior used to sit fuming and biting his nails, and Hester's finer ear was offended; it was only their mother who followed the service with simple devoutness, and who thought with tears in her eyes of her own good father and the Sunday evening prayers at the bank-house over the way.

To-night in the course of reading the book opened at one of the lesser prophets, and as Mr. Hallett read in his stiff, slow, pompous way Mary Kelynge shrank and blushed and trembled in her corner, and felt as if all the denunciatory woes were being hurled at her head. The servants were looking at her; one or other of them, no doubt, with that spying faculty our domestics have, had seen her going with Mr. Andrew to look at the new plantation, and carried the tale to the kitchen. It is there everything is known a great deal sooner than in the drawing-room; and while Mrs. Hallett was innocently praising Andrew for being so good-natured and kind to their guest, the cook, housemaid, parlourmaid, and the boy who cleaned the boots, had made up their minds that Mr. Andrew had secret information about the death of the real heir, and was courting the owner of all the money.

"And she would need it too, if you ask me,' said the cook; "such a figger as never was, and a colour like a dishcloth that has been washed without being put through the boil."

Miss Kelynge dutifully swallowed the gruel Mrs. Hallett made and brought up with her own hands, and meekly pinned a stocking round her throat to avert any possible evil consequence of the night air; but it was not her chest that was in danger; it was not cold that made her shiver and tremble, and sent her pulses beating in the silence of the night, when her mind travelled over the events of the day.

Events? The course of history in Melchisford never offered anything worthy the name. "If it weren't for a death now and then there would be no life in the place," Mrs. Smee used to say, with that peculiar humour that her townsfolk scarcely knew how to appreciate. Of outward incident life in Melchisford was as bare as the desert of Sahara; but there is an inner history for each of us where very surprising and lively events sometimes occur, and where all sorts of bustling emotions are set at play.

Mary was very silly, of course, sillier than most young women in this experienced age, to dwell as she did upon a hand-pressure, a look in the eyes, a murmured word, to be conscious as she was, down to her very finger-tips, of one young man's presence the moment he came into her neighbourhood.

People call a sensation such as this by very different names—old-fashioned folk call it falling in love. Andrew Hallett would have laughed aloud if anybody had suggested that his gallantries were likely to have this result. He would have told you that girls have an insatiable appetite for homage—that they expect that sort of thing from every young man, and are offended if they don't get it. Perhaps he was right in the abstract. He might have given a flower to Sophy Barker, or hung over the piano singing duets with Lucy Potter, without waking in the breast of either immediate visions of a wedding ceremony in St. Peter's; but as for the young woman in question, incidents of this kind had not been plentiful in her experience, and she was so little used to society that she could take nothing as a matter of course.

And, indeed, Andrew's behaviour might have deceived even the experienced. He met her by accident half a dozen times a day, the nearness of the office favouring chance encounter in corridor or passage; he asked her to do little services for him, to sew a button on his glove, to look up a reference for him in one of the forgotten poets.

Truth to tell, she did neither task very well; her fingers trembled and bungled over the sewing of the button on the big yellow glove, and she spent hours fluttering over the leaves of the most

unlikely books in search of that important quotation.

In spite of those well-stocked shelves in the library at Hallett's, she was but slightly tinctured with learning. When she proposed to Hester in a timid way that they should examine the archives there Hester looked a little haughty.

"Of course, if you wish it," she said; "but why should you take so much trouble?"

"But it is no trouble."

"Andrew knows nothing of Marlowe, and cares less."

Mary looked extremely shocked at this heretical suggestion.

"He wants to find that passage particularly," she said, "and I should like to help him if I can. He is like a—he is so kind to me."

"Is he?" said Hester, gravely. "Of course, if you wish it we shall go."

Was Andrew really and truly kind to her, or could it be that he was honestly falling in love with her? It took a little effort of the imagination to picture this young conquering Adonis—for this was how Andrew was looked upon in Melchisford—a victim to Miss Kelynge's very modest charms. Hester scarcely gave a thought to her own beauty, though she was glad of the gift; but she could not deny that Nature had been very unkind to her friend. That dead flaxen hair, that mottled complexion, those eyes that had cried away all their brightness, were scarcely likely to ensure her many victories; and then, too, she had not those qualities of mind that severe female moralists find so much more admirable than a complexion and a pretty mouth and nose. She was very imperfectly educated, and had never so much as heard of the Restoration dramatists in whom Andrew had professed such a sudden interest. Indeed, when at his request she tremblingly copied out the passage for him, the half dozen lines held quite as many mis-spelt words.

Andrew, however, took the paper with the most lively expressions of gratitude, and put it carefully in his pocket-book, though it is to be feared it afterwards went to light his pipe. He hung over the piano when Mary was at last persuaded to play "Warblings at Eve," which represented all her conquered territory in the realm of music.

It was a very inadequate performance, but Andrew was as effusive as if he had been listening to the skilled execution of a Liszt or a Chopin. He was so complimentary that even his mother looked up from her work vaguely surprised and puzzled.

"I'm no judge," she said to her daughter when she went to her room to bid her good-night. "I never had any skill at the piano myself; but you have had the best masters, Hetty, and you can tell. Would you call that good playing?"

"No, mother."

"And yet Andrew seemed so pleased, and he is a judge," Mrs. Hallett went on, still busy with her wonder; "perhaps it is you and I who are wrong, Hetty; Andrew has such a good ear, and Mr. Boase used to say, you know, that his voice was good enough for the stage."

Hester looked at her mother's kind, unsuspicious face, and her own doubts seemed to her all at once very traitorous. She was sitting up in bed, and she suddenly put her arms round her mother's neck and laid her head on her shoulder. Her long hair made a veil for them both.

"Perhaps, perhaps," she whispered; "I should like to feel sure that I was wrong."

"But I like your music best all the same," said Mrs. Hallett, releasing herself with a laugh. "There, my child, lie down, and let me tuck you up as I did when you were little, and you and Andrew slept in your little cribs side by side. Dear, dear, to think how you have grown since then!"

Andrew's surprising behaviour was not lost on his father. The older man's eyes saw all that was going on, and not an attention on his son's part but what was observed by him. He watched the pair furtively at dinner, when Andrew gaily insisted on filling Miss Kelynge's glass, or peeling her apple, or cracking the walnuts for her. He accepted his son's excuses in silence, when the young man left the elder to his after-dinner glass of port, and sauntered with his cigar on the lawn. Andrew went out alone, but in a minute or two Mr. Hallett knew that he would be joined by a short stumpy figure in black, with a white shawl muffling its neck, and the voices would presently sound fainter and further off.

At first Hester was sometimes of the company, but latterly she sat sewing with her mother, and was ready to play to her father when he joined them in the drawing-room. Mr. Hallett was generally rather gloomy and silent when he came into the room, and an irritable line was deepening on his forehead. His wife, who always suffered an undercurrent of fear lest something should be going wrong at the bank, never dared to question him, though she used all her simple arts to soothe him, but it was not solely business that was ruffling the lawyer's soul and irritating his temper.

He held his peace however, until one day he seemed unable to restrain himself any longer.

A basket of fruit had been sent from Hallett Place; it was brought into the dining-room when dinner was over and the ladies had retired, and when father and son were for a moment alone.

"These are what I call grapes," said Andrew junior, with conviction; "we can't come near them. I'll take some of her own property out to Miss Kelynge; I daresay she'll let me share it."

"You are very attentive to Miss Kelynge."

Andrew, who was in the act of conveying a grape to his mouth, put it down, and looked at his father.

"Do you object?" he asked; and somehow the question seemed to make Mr. Hallett a trifle ashamed of himself.

"I object to your making yourself ridiculous," he said, testily.

"I am sorry my conduct presents itself to you in that light," said Andrew, who at times could use a phrase of dignity too. "It's the more unfortunate because I was really doing my best to please you."

"To please me?"

Andrew looked down at the fruit and carefully rearranged it, but when he spoke it was with great cheerfulness; not at all as if he minded the charge of being ridiculous, as most young men would mind.

"You remember, sir, you yourself in this very room recommended me to be civil—you put it pretty strongly, if I am not mistaken."

"I pointed out to you that Miss Kelynge was our guest, and that it became you, as my son, to be respectful to a lady who is in a very trying position."

"Yes, it's a trying position," Andrew assented, with the frankest candour; "you see, sir, I hadn't thought of it in that light till you pointed it out. It's all a toss up. In a month or two she may have to turn out and be a governess, or a companion, or something of that sort—it's rough on a woman—one can't help feeling for her. If it had been Hester—"

"We are not talking of Hester."

"No, Hetty is pretty safe, and besides she has you and me to look after her; but this poor Miss Kelynge—upon my word, it's a shame—"

"You are doing your best to console her."

Mr. Hallett's tone was contemptuous; the father was perhaps for once ashamed of the son.

"Yes," said Andrew, reflectively, "I do my best. She is good enough to take me as a friend—or a brother; a woman, and a helpless dependent woman as she is, must have someone to turn to. I've no doubt she will expect me to find her a situation when—the catastrophe comes," he ended, gaily.

"Very probably. Pray don't let me keep you from your—friend."

His voice had still an edge of contempt, but he did not look up. His eyes, indeed, were fixed on his plate, and it is just possible part of the contempt was for himself.

Sometimes it is as well to be able to dispense with words. Had the father meant to say—

"Don't go too far till you are sure"?

And had the son meant to reply—

"You may trust me for that"?

It is just possible. If it were so, how much better it was, and what a saving of their mutual self-respect, that they should understand each other without the clumsy medium of words.

### CHAPTER XI.—DOUBTS AND SUSPICIONS.

LAVINIA MOSS soon found frequent occasion to drive into Melchisford. Indeed, there was scarcely a day of the year when the gig which Mr. Moss still retained was not in requisition to carry half a dozen Mosses or Drinkwaters into the county town on one or other of those errands that are so important in feminine eyes.

But whether it was new ribbons, or laces, or gloves, or what not in the way of finery that the farmer's scanty means went to buy, the shoppers invariably ended the town visit at the bank-house.

The Drinkwaters were quite as welcome as the Mosses there; John Mellish would sometimes look out over the wire blind of his private room, and see them trooping up the steps, and hear them, too, a bevy of laughing, red-cheeked, bright-eyed girls. He never grudged them the free hospitality of his home; they were company for their Aunt Mellish, who had no great choice of society in Melchisford; and for himself he liked their smiling looks, their readiness to take a jest, even if was a little broad, their chatter, which all at once made the silent house so gay.

Uptairs the board was unfailingly spread with the best the house contained for the hungry troop with their keen country appetites. Hospitality was a tradition with the Mellishes; indeed, a private banker is compelled to be an entertainer, much as a doctor is compelled to have a good house and a brougham—for the sake of his credit. If he has losses he must never reveal them by any change in his style of living, for since the amount of his capital is unknown to the public, anything, however slight, that lessens the general belief in his soundness would immediately affect his financial stability.

The Mellishes had always kept open house, though since John Mellish's marriage the social standing of the guests had somewhat altered.

Lavy Moss had three or four sisters and as many cousins at her heels when she walked into her aunt's drawing-room one morning in June. It was natural for Lavy, who was the eldest, to walk first, and the others obediently fell behind.

"Well," said Aunt Hannah, allowing herself passively to be kissed by half a dozen pairs of lips, "how's your father?"

"Oh, he's all right," said Lavy, with fine indifference. "They're killing; father says he'll send you a loin of pork."

This was naturally a great item of interest to Aunt Hannah, and she had many questions to ask about that and other matters.

"How many pounds of butter did you churn last week?"

Lavy answered, with a yawn, that she had not the remotest idea.

"You want me back at Chalk End." Hannah shut her mouth very firmly.

But at this the troop protested.

"It's a great deal jollier to have you here," said Sally Drinkwater; "we should be moped to death if we hadn't the bank-house to come to."

Mrs. Mellish was not a person of many words; she accepted the protest in silence, though, like the parrot, she may have thought the more.

"I want you to send little Hannah over to stay for awhile," she said, turning to her eldest niece. "I've been talking to Mr. Mellish; he says she can come here and go to school."

"She can't be spared," said Lavy, rather sharply. "If you're in want of company, Aunt Hannah, I'll stop for a day or two. You can lend me what I need, and if there's anything going on Tilly can bring my blue gown in with her on Wednesday."

"Your father will miss you."

"And a good thing if he does; he'll think the more of me when I get back. Now, you girls, hurry up, and don't be all day eating. The cob is wanted to take the milk to Bylands, and you've got to get home before tea."

"What's come over Jerry?" asked Aunt Hannah.

"Derrick let him down and broke his knees," said Lavy, shortly, seeming for once to be aggrieved at these repeated frowns of fortune.

"If I had been there," said Hannah, in a subdued voice, but with a curious glitter in her dark eyes, "it wouldn't have happened."

Lavinia brushed the crumbs from her lap and stood up. "I don't see how you can be so sure of that," she answered. "Anyhow, it has happened, and the cob is wanted, and the girls must go."

"You're in a great hurry to get rid of us," said Sally Drinkwater, in an offended tone.

"Yes," Lavinia nodded, "I am in a hurry; I've told you one of the reasons why. I'm not going to tell you the other, so you needn't wait for it. Come here, Katie, and let me tie your hat; Jane, you sit still, and don't wriggle, or you'll fall out of the gig."

"Oh, I know very well what it is," said Sally, spitefully.

"Very well, since you know, there's the less need to stay."

Thus she admonished the troop, and drove it, deaf to all remonstrance, downstairs before her. The other girls liked the lively scene from the bank-house windows just as well as she, but Lavinia, by right of her seniority, as well as by her force of character, had the art of being obeyed.

She stood for a moment on the doorstep after the well-packed dog-cart had disappeared round the corner, looking with a fixed stare at the tall red house opposite. Her handsome face had rather a hard expression, and she held her head well up after the manner of one who has come to a fixed resolution.

Mrs. Mellish had not gone downstairs; she had witnessed the outset from her seat in the window, and she still retained it when Lavy returned to the room. Lavy looked round her, and, selecting a chair from the prim row placed at a nicely calculated distance from each other against the wall, drew it brusquely forward to the window and sat down with her knees almost touching her aunt's.

"Now," she said, "you may as well tell me everything."

Mrs. Mellish looked at the girl in silence for a minute or two, but she made no pretence of not understanding the question.

"They never come to this side of the house; I've seen him at times, and I've seen her, but never together."

"Oh, I daresay he's too clever for that. He knows that you are here to see what you can see, and that I'm sometimes here to hear it." Lavinia threw out her hand with a gesture of contempt. "They keep it all for the garden and moonlight nights, I know." The blood came up hot into her face, and her eyes seemed to blaze with the suddenness of her passion. "They'll let you see nothing that they can help; but you're a relation, you've the right to go and come. Why don't you go and find out?"

Mrs. Mellish shook her head faintly.

"It wouldn't be any good. Hester and her mother would keep me in the room with them. I went once"—she spoke in a lower voice—"you know the cottage old Mr. Barnard had till he died?"

"Yes."

"It belongs to the bank. I got the keys and went there. I saw them together."

Lavinia got up so suddenly that she nearly tilted over her chair. "Very well," she said, "I can do that too. I'll get the keys from uncle, and go to-night."

"Your uncle will wonder."

"Pooh! I can make Uncle John do anything. I'll go round by Wright's Lane and get in at the back, I know the way, and I know the window that overlooks the garden. It's perfectly fair," she cried out, suddenly, as if someone had accused her. "If he's been playing me false, haven't I a right to know it? and do you suppose if I went a hundred times to the house I'd ever be allowed to find out? They're proud, Hester and her mother, they think themselves above us; they want Andrew to have the heiress. Miss Kelynge has money and family, and I have only good looks and brains. I suppose he thinks it's for him to choose, but he may find out his mistake."

At that moment Mrs. Hallett's face was seen at the opposite window. There was no pride in it, there was nothing but kindness, touched with a hint of anxiety, perhaps, in the glance which she fixed on the lower windows, where her brother's head would presently appear.

Mrs. Mellish got up from her seat and rearranged the curtain in its proper folds.

"Mr. Mellish will be coming to dinner in a few minutes," she said, as she lifted back her chair to the appointed spot.

"Then," said Lavinia, "I'll go down and speak to him."

She ran downstairs to the first floor, which was given over to the uses of the bank. An elderly clerk, the last of the staff, was leaving her uncle's private room when she reached it, and she nodded a bright good afternoon to him. Having made up her mind to a course of action she had recovered some of her habitual lightheartedness, and was quite ready to return her uncle's cordial greeting.

John Mellish, a florid, fair man, with the sanguine temper of his complexion, looked a trifle careworn and worried; but the lines in his face relaxed at the sight of Lavy. Lavy was a fine, handsome young woman, a pleasant enough sight in any man's eyes.

"Well, my lass," he said, "have you come to take me upstairs to your aunt? Wait a minute, till I lock this drawer; there's nothing in it, but it's a good habit to lock everything."

"I want you to unlock something, Uncle John."

"Is it your father's pocket, my dear? I'm afraid you won't find much in it." A passing look of worry crossed his face. "There's a hole there that lets everything run out."

"Oh, no," said Lavy, with an easy assumption of indifference, "it's only old Barnard's cottage, in Wright's Lane."

Mr. Mellish stared at his niece, and then he laughed in a very hearty fashion.

"Why, my girl, are you thinking of getting married, and setting up house?" he asked. "Perhaps you've a notion of making up to my old cashier, Whitehead. I've seen him looking at you out of the corner of his eye. The house in Wright's Lane is the perquisite of the head clerk when he takes a wife, you know."

"Uncle John," said Lavinia, seating herself on the arm of the office chair, and speaking half authoritatively, half coaxingly, "never you mind what I want it for; but you may set your mind at rest about your precious clerk, it's not to see whether I would share it with him. He would need to have a palace to offer me before I would consent even to consider him as a husband."

"Well, what do you want to see it for?"

"Never mind that; women hate to tell everything."

"That's a true word." He laughed again. "If it's nothing but the buying of a twopenny ribbon you like to make a mystery of it."

"If you lend me the key I'll bring it back to-night before supper," said Lavinia, sticking to the point.

"The place is smothered in dust"—he tried a last faint remonstrance; "nobody has set foot in it for months."

She knew better, but she did not correct him.

"I won't take any harm," she said, easily, aware that she had gained her point.

Mr. Mellish, indeed, was not very difficult to persuade, and his good-nature allowed him to suppose that Lavinia wanted to use the old house for some harmless purpose of her own. Even if she meant to keep a tryst there he found nothing in the suggestion that greatly shocked his sense of delicacy or propriety. His knowledge of women was superficial, and his marriage had not helped to raise his standard, or to cultivate in him that finer sensitiveness on their behalf that is the essence of chivalry. He had conducted his own brief courtship sometimes in the dairy, and sometimes in the barn, at Chalk End—where he had followed the active little woman who had kept matters straight while she ruled there. The Mellishes had never been "stuck-up," as the Halletts were sometimes accused of being. It was well known that the first owner of the bank had raised himself to that honourable position, and the second was like him in a certain homeliness of aim and view, that his more polished brother-in-law found antagonistic.

Perhaps he had that streak of commonness in him which only the third generation of prosperous tradition is supposed to remove; at any rate he saw no harm in Lavinia's wish to keep her secret safe from prying eyes.

He had so persuaded himself, indeed, as to the shrewdness of his guess, that when he was washing his hands in preparation for the five o'clock dinner, now steaming on the dining-room table, he said to his wife,

"I suppose it's young Hallett who is fooling with Lavy?"

"She's a good-looking girl," said Mrs. Hallett, with characteristic prudence; not even to her husband would she betray the secret hopes of her own people.

"A strapping wench—would make two or three of you, my dear. Well," he said, with a sigh, "Hallett and I don't pull over-well together, but I don't care if she catches young Andrew; if the girls don't marry it will be a poor look-out for them."

"Is there anything wrong at Chalk End?" asked his wife, looking up at him with a sudden light in her dark eyes.

"No, no, nothing new; but Caleb's very unfortunate," he sighed. "To think that he could leave the hay-rick unthatched, when any child might have foretold it would rain!"

"Lavy said nothing of that."

"Pooh! Lavy's a girl, with nothing in her head but the thought of a sweetheart. But Caleb's to blame; half the hay's blackened, and good for nothing, Moult tells me; and I hear that the colt's down, and broke its knees so badly that it's not worth an old song. Caleb's too easy; it's downright wicked with all that family of girls—"

"I ought to be there," said Hannah, for the second time that day.

"Well, I think I've got a word to say to that," said her husband, with recovered good-humour. "Come away, come away to dinner; there's Lavy fretting her life out to be off to her sweetheart."

## CHAPTER XII.—AN OPPORTUNE MEETING.

LAVINIA was not so impatient as her uncle supposed. She had arranged her plan of action, and she could wait the fitting moment to put it into execution.

The rain which had spoiled Caleb Moss's hay was a memory of yesterday, put to shame by the bright serenity of to-day. It would but draw a subtler scent from the roses, and double the attraction of the garden where they grew. Lavinia could not have chosen a better night for her purpose had she waited a year.

She was, however, in no immediate haste to set out. John Mellish adhered to the fashion of his youth, and dined at the hour of five, surely the most inconvenient a man could hit on; the Halletts had, on the contrary, moved on with revolving custom, and were some two hours later in meeting at the family board. Lavinia knew the laws of the Red House, though she had never been a guest there, and she was inclined to scorn them.

"It's all because they like to think themselves better than other people," she said; "they can't even eat their dinner at the same time as other folk."

"Well," said Mr. Mellish, tolerantly, "I can't see how you can make out that they're any better for waiting on hungering; there's nothing to my thinking so trying to a man's temper as an empty stomach."

"Mr. Hallett is different from you, Uncle John; he would die sooner than eat his dinner at five o'clock."

"Well," said the banker, speaking philosophically, "Mary wasn't brought up to these ways, but a wife has to please her husband."

"That's as old-fashioned a delusion as your dinner-hour, Uncle John—I for one don't mean to go by it."

Mr. Mellish laughed once more.

"Wait till you get a husband," he said; "it will be time enough then to make up your mind."

Something in this remark seemed to displease Lavinia, for she said no more. Mrs. Mellish also was silent—but that was so usual an occurrence that no one took any notice of it; and the banker, who made a serious business of dinner, devoted the next quarter of an hour to the dishes before him—except when he spared a moment to rally Lavinia on her mysterious interview.

Dinner over he retired into a large, well-worn easy-chair, and drawing a silk handkerchief from behind the cushion, spread it over his face, and deliberately gave himself over to sleep. Mrs. Mellish sat opposite him, and drew out her work. In this silent after-dinner hour she had knitted innumerable stockings for the younger Moss girls, whose faculty for wearing out the knees and toes of their garments was only equalled by her zeal. On the principle of supply and demand she appeared to be provided with work for the rest of her natural life.

Lavinia withdrew to the window and looked out. Her uncle's ill-timed jests had irritated her, and she was now devoured with impatience; the enforced silence chafed her almost to the point of rebellion.

To have to sit still when you are young is quite as disagreeable as to have to stir about when you are old.

Life seemed scarce worth living, ordained as her uncle ordained it. In an hour or so he would wake up and call for tea, after which he would either drop into a neighbour's house, or a neighbour would drop into his, the casual visit having whist at sixpenny points as its object, and a hot supper garnished with the old anecdotes to conclude the day. Lavy looked round once or twice at her aunt's silent, rigid little figure, motionless but for the busily moving fingers. It had been thought great promotion for Aunt Hannah to quit the farm for the bank-house; perhaps it was, but it was promotion to dulness, descent rather to abysmal depths of dulness in the girl's eyes. Naturally Lavy asked more of life than to keep a husband's house in order, to cater for his hearty appetite, and to hold her tongue while he slept off its excesses.

"When I marry I shall taste the full sweets of liberty, and wring pleasure of its last drop"—that is virtually what every girl of Lavy's type says to herself. Lavy's little matrimonial scheme was not without its ambition. Andrew Hallett was the finest gentleman she knew—the best, take him all in all, who was ever likely to cross her path, for in these days lords of Burleigh are but few.

When, therefore, this bold, good-looking and dashing young man, who had a reputation for being the best match in Melchisford, came more and more frequently, on one pretext or another, to the farm, Lavinia was not slow to meet him half way. She did not blush or tremble, or hide herself when she heard the sound of his horse's hoofs; on the contrary, if she chanced to be doing anything about the farm (and she was often employed in this way) she retired upstairs instantly to put on her best gown and her newest ribbons in his honour. She took the visit frankly as for herself, with no pretence that it might be for Sally Drinkwater, or any one of the sisters or cousins; and she knew how to make matters pleasant for the visitor, bringing out the home-brewed ale for his refreshment, singing lively ballads when he was inclined for music, in a voice that was naturally fresh and tuneful, or sauntering with him round the neglected farm premises.

Andrew, whom rumour allowed to be rather a killing young gentleman, and who had practised a good deal of mild flirtation with the Miss Barkers and the Miss Potters, found this direct dealing rather novel and amusing.

When he had whispered some tender nothing into Emmie Barker's ear as they sang duets together, in preparation for the Barkers' musical evenings, Emmie would drop her head and blush; but when the same experiment was tried on Lavinia Moss she looked at him straight in the eyes with her bold, frank glance, and accepted the phrase as if he meant it. Perhaps he did mean it, and yet even he felt that matters had become more serious than he quite liked when he kissed Lavinia under the maple tree. Lavinia was not a girl who could be kissed and straightway forgotten. She considered herself pledged to Andrew Hallett, and no doubt she would hold him to his bond.

If she seems very unmaidenly, it may be remembered that she had no mother to arrange the little matter of her future for her, while she could count on no help from her father. It would have puzzled Caleb Moss to account for his own marriage, and it certainly never entered his muddled, absent head that his daughters could possibly want husbands. He was considered an authority on pigs, but the genus woman was a sealed book to him, in spite of his large opportunities of study; therefore poor Lavinia had to depend on her own exertions. Many girls have to be their own fathers and mothers when the question of their settlement in life comes up, and they do not necessarily make the worst wives because they desire to secure the best possible bargain for themselves. Lavinia meant to make Andrew a very good wife; and surely she loved him, else why should she be so wildly jealous at the bare suggestion that another woman might claim him?

The Red House gave forth none of its secrets, though she never took her eyes from it. The youth and gentility of Melchisford might saunter on the pavement below, the most attractive bargains might display themselves in Barkers' window, Lavinia had no eyes except for the opposite row of windows. The office blinds were drawn, and the work of the day was over for the Halletts, father and son. She pictured the family at dinner—the ladies retire, the gentlemen are left to their wine—they did everything genteelly in that establish-

ment; she could hear the soft tinkle of Hester's piano; she saw Miss Kelynge lay down the bit of embroidery that never got any further, and go blunderingly out of the window. (Mary was certainly not a good intriguer; she must needs go heavily, as if she wanted to attract rather than elude notice.) And then—and then—when Lavinia's fancy reached this point she clenched her hand and set her mouth in a hard, straight line.

Presently Mr. Mellish pulled the handkerchief off his face, and sat up, remarking, with the habitual unveracity of the after-dinner napper, "Yes, yes, I've heard all you've been saying; I've just been shutting my eyes; you didn't disturb me at all, but I heard every word."

"Then you've heard a great many secrets, uncle," cried Lavinia, getting up and coming forward to the table. "Aunt Hannah, mayn't we have some tea?"

"Yes, wife, let us have tea; here's poor Lavy dying to keep her tryst."

"How clever you are to-night, Uncle John," cried the girl; "we can't hide anything from you. Perhaps since you have found out all my secrets you'll be coming to Wright's Lane to betray us?"

"No, no, my lass; you stick by your lover if he's worth holding on to, and I'll never interfere. You've got nothing to look to, you girls, but a husband apiece, and the sooner one of you gets settled the better I'll be pleased."

"Then you don't want to know who he is?"

"You're a clever lass, you won't take the wrong one."

"Not even his name? What a delightful want of curiosity!"

"I'll hear it when the banns are proclaimed, I suppose," said Mr. Mellish, with the air of having said something funny; "unless you mean to run off with the fellow?"

"Now, Uncle John, you are beginning to become inquisitive. I had better sing to you, in case you should find your curiosity stronger than you think."

Lavy indeed wanted an outlet for the restlessness that devoured her. Now that the moment was at hand when her lover's perfidy might be revealed to her, she felt all her veins tingling and her pulses throbbing. She sang song after song with an energy and force that elicited hearty applause from her uncle, who liked a good stirring tune, especially if his ear was familiar enough with it for him to whistle a subdued accompaniment. What very unrefined taste, to be sure! But would the banker have been happier or worthier if he had been hypocrite enough (as some of us are) to pretend that he could appreciate nothing but classical strains — Wagner, perhaps, and his school?

The music was stopped by the simultaneous entrance of Mr. Barker and Dr. Rose, who came in with that air of not having at all intended to come, and being quite surprised to find oneself there, that was considered good manners in Melchisford. John Mellish, too, received them with as amazed an uplifting of his eyebrows and as hearty a hand-shake as if he had not met them for a year, though, as it happened, they were sharers of his toddy and his whist two or three times every week.

Mr. Barker gave Lavy a big, limp hand to shake, but the doctor hoped Miss Lavinia would not deprive the company of her voice.

"You mean that you hope I'll stop singing, doctor," said Lavinia, who by reason of her blunt candour was rather a favourite with the woman-hater. "You needn't be afraid, I don't mean to let myself be pressed."

"Lavy has got to call on a friend," said John Mellish, looking at the girl with a twinkle of fun in his eyes. "Sit down, gentlemen; any news in the town to-night?"

This was Lavy's chance, and she took it. Her aunt followed her silently out of the room when she had supplied the wants of her guests.

"You'd better take my big cloak," she said to Lavinia.

"Why, it wouldn't come down to my knees!" cried the girl, with a laugh. "You are such a mite, Aunt Hannah. No, I'll go as I am."

"But if anybody should see you?"

"Well, if anyone should, what then? *I* am not playing a double game, that I need be afraid to be found out. If he is—"

"Well?" questioned Mrs. Mellish, with the same inscrutable look in her dark eyes.

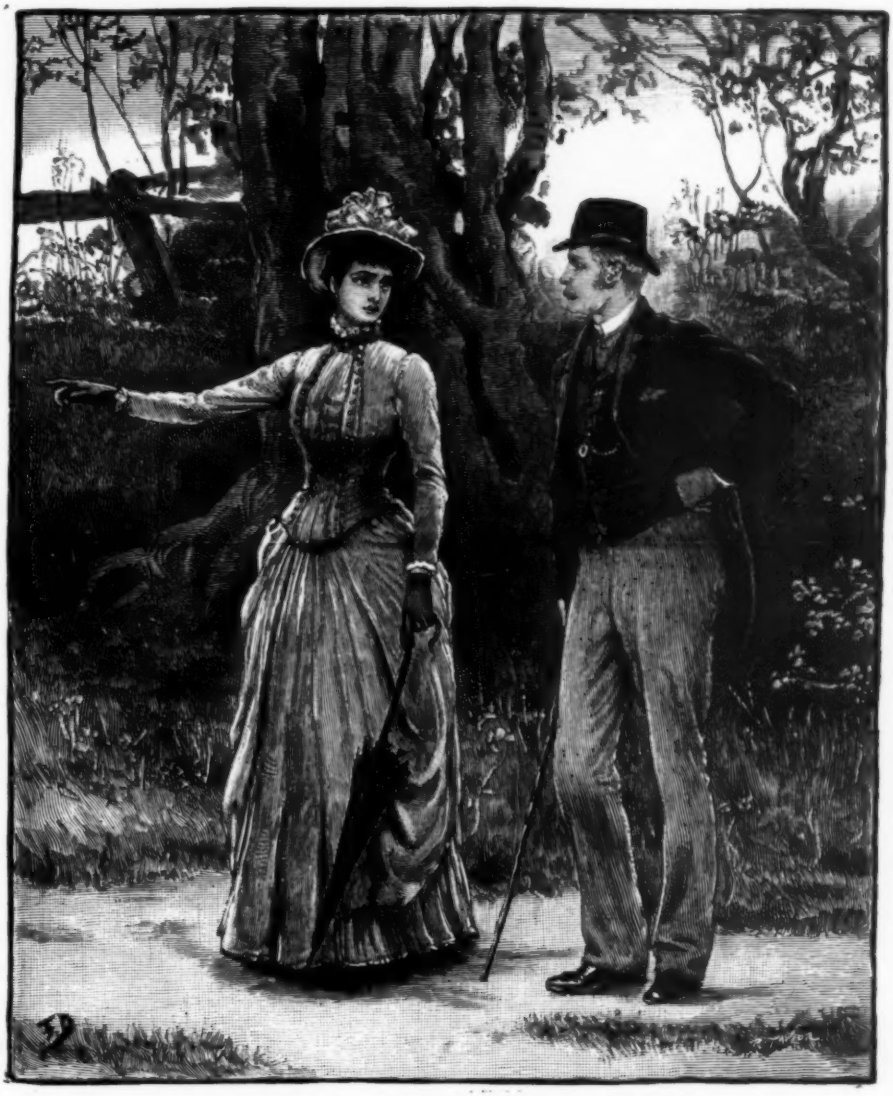
"Then he will find that he has got you and me to deal with," said Lavinia, recognising that in this little woman she had an ally who would not forsake her.

"You'll be home by ten? Mr. Mellish likes to lock up by then."

"I'll be back before that; they have prayers at ten over there"—she waved her hand in the direction of the opposite house.

She was soon ready, for the summer night demanded no extra wraps. A natural candour made her shrink from setting out on her errand in disguise, though it was not strong enough to save her from the meanness of spying on her lover in secret. There is nothing that so distorts the moral vision as jealousy, and Lavinia had easily enough persuaded herself that she was justified in taking any step that would reveal the truth to her. From her lover she knew instinctively she need not look for it. "If it is in his interest to throw me over, he will do it without scruple," she said to herself, bitterly; "but he will find it isn't only his interest he has to consider."

The little house in Wright's Lane was the only vantage-point from which the garden at the Red House could be overlooked. On one side the yard and kitchen premises, and on the other a high brick wall and a row of old and full-grown trees, hid it from prying eyes; only where it was fenced by the lane was it open to observation.



Wright's Lane was a mere *cul-de-sac*, however, leading to nothing but the little old house which was part of the bank property, and which had been so long unoccupied that it could scarcely be considered a source of offence. John Mellish had talked of letting it since his head clerk preferred to live in the town, but the house was old-

fashioned and dull and damp, and a tenant was not forthcoming.

"I would rather buy it than that he should let it," Mr. Hallett had said; "the gardener's cottage is getting too small for him with all that tribe of brats. But if Mellish knew I wanted it, he would find some way of getting out of the bargain."

"Well, sir," laughed Andrew, "I don't know that he would be far wrong."

The evergreens, however, were not as yet grown, so that Lavinia had not their thick shade to dread. She walked quickly through the town, nodding now and then to an acquaintance, but not stopping to exchange any words. Melchisford was

LAVINIA EXPLAINS THAT SHE WAS GOING TO SEE FOR HERSELF.

"He's not likely to let it in a hurry," said Andrew junior, who had come down with his father to this extremity of the long garden to look at the new plantation; "and those evergreens will soon enough screen the view, though they won't add to the attractions of the house."

"He'll be sure to say we did it on purpose," growled the elder Hallett.

quite accustomed to the sight of Lavinia and her sisters, and so her presence in the town caused no surprise. She soon left George Street, and struck into a byway crossing the river (Melchisford calls it a river, though ignorant strangers have been known to mention it as a ditch) by a little footbridge. The river was caught in Mr. Hallett's garden, and widened into quite a respectable little

pond before it was allowed to go on again, and it was here that Mr. Hallett was trying experiments with the new shrubbery.

She made quite sure of reaching the house unobserved; indeed it was such a dull little lane that led to it, and such a melancholy little house when you reached it, that the married bliss would need to be very solid indeed that could have survived its dreariness, and no one would have dreamt of walking in its neighbourhood for pleasure. Lavinia was therefore the more startled when in the gathering dusk she saw someone approaching. She had unshaken nerves and a fine courage; she would have faced even the headless lady of Hallett's with a calmness that would be of the utmost value to the psychical-research people. It was only where her pride, or her jealousy, or her love, perhaps, was involved that her feelings were intense enough to set her pulses throbbing. She was not afraid of any ghost, unless it might be the ghost of love—dead and vanished love. Was it that she should presently see stealing through the young bushes—a darker shadow in the tender twilight? She was not afraid of man either, but she was annoyed, fearing this intruder might detain her, or discover her errand.

He was within a yard or two of her now, and she suddenly exclaimed, "Tom, you here?"

"Lavy, is it?" answered Tom's cheery young voice. "Well, this is a queer place to meet." He was shaking hands with her heartily. "Didn't the doctor tell you I had turned up? Got an off day, and brought Dot down for an hour or two to see Hester. The doctor has gone to your uncle's, and I promised to catch him up."

"He is there, I left them together; but how do you come to be in Wright's Lane, Tom?"

"I think I should rather ask how you come to be here, Lavy. You can't be making for the short cut I've just taken—I came over the wall at the bottom of the Red House garden. You remember the elm at the corner, where the robin used to build? You can reach the top of the wall by climbing the tree, and then it's only a question of jumping down—I can manage that yet, though I'm not so light as I was twelve years ago. But you can't scale the wall from this side—there's scarcely foothold for a fly."

"I wasn't going to the Red House," said Lavinia, slowly. Could she tell him what she purposed doing? There was a something of frankness and sincerity about this young fellow that almost compelled confidence; and yet anything that was mean or underhand had a way of looking more unlovely when you unfolded it to him—so that it came to be a kind of punishment as well as a relief to make confession to him. Lavy's cheeks glowed with sudden shame as she looked into this honest young face, lit with goodwill, and pleasure, and kindness that went out to all the world.

"But you will go and see Dot?" he was saying; "she didn't know you were in town, or she would have run across to have a word or two with you. I've to take her back to-night; the principal was obdurate on that point."

Lavy said nothing, but she turned away with a gesture that was significant. The smile died out of Tom's eyes at once.

"Lavy, what is it?" he said, laying his hand on her shoulder; "you are in trouble, my dear, and you may as well tell me all about it, and let me help you, if I can. Come, Lavy, we have known each other since we were no higher than my stick, and you've got me out of a good many scrapes before now—can't I work off some of that debt? I'm good for listening, anyhow."

"Tom," she turned on him suddenly, "you've been to the Red House. You must know—you must have seen—"

"What must I have seen?"

"I will tell you what you saw. You saw Andrew Hallett whispering to another girl as he whispered to me, saying the same things, perhaps; only—only—he couldn't tell her, even he, that she was pretty, could he?" Her smile was very bitter. "But what does that matter? You can fool a girl in a hundred ways; we are so ready to listen and to believe and to give our hearts. I will tell you where I was going, Tom. I was going to the cottage"—she pointed along the dusky lane—"at the foot of the Red House garden to watch, to see for myself, to make sure. They go down there to do their love-making, and I should have been witness to his falseness."

"You didn't mean to do it, Lavy; you only thought of it. You wouldn't have done it."

"Yes, I would; I would go now, only there is no need. You have told me everything."

"I?"

"You can't deny it." Her voice was almost fierce.

"I—I was with Dot, you know;" but the evasion came awkwardly from him. He hung his head—he had boldly asked for Lavy's confidence, but he did not in the least know how to console her; for it was all true. Though he had been with Dot, perhaps because he had been acting the happy lover himself, he had eyes for this other pair who played the same rôle—all the world might have seen it, that courtship in the green garden. Yes, Tom could not deny it, but that only made his position worse. He could not counsel Lavy to forget a lover who had proved himself worthless, since it was evident that her affection had all turned to hate, and to pour railings and vituperation on the false Andrew—what would that be but to add fuel to the flames of her anger? Tom had never before felt himself in such a plight, and it might have been a lesson to him to avoid asking young women to confide in him in the future; but it is to be feared he was incapable of learning to withhold his sympathy when it appeared to be called for. A sympathetic temperament has it inconveniences.

"Never mind, Tom," said Lavy, with a grim smile; "you don't know what to say, so don't say it. It isn't pleasant to be scorned, to be thrown away like a useless thing that has served its day. Well, I know that, so we won't discuss it. As for Andrew Hallett, we needn't discuss him either."

"Forget him, Lavy; let him go—he isn't worth spending a regret on."

"Oh, I am not going to break my heart for him," she said, with concentrated bitterness. "No, I'm not going with you, Tom; I'm going to take a walk—I want to be alone. And you needn't say anything about me at the bank-house—Aunt Mellish knows where I am."

"But I can't leave you like this," he urged. "Come and see Dot; we've to go up by the last train, but I'll bring her over to your uncle's if you'll go back with me."

"Not to-night," said Lavy, shortly; "give Dot my love; you needn't tell her you know, Tom. Dot wouldn't understand."

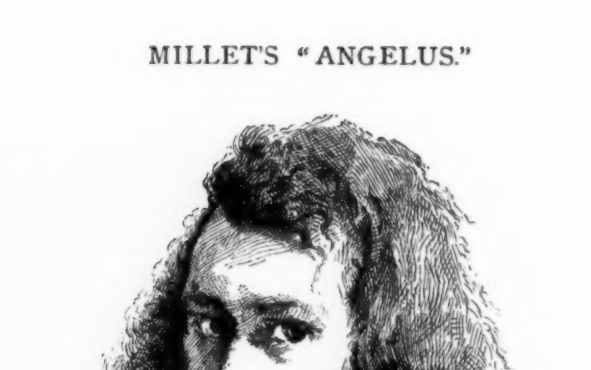
No; Tom hoped, as he stood gazing ruefully after the girl's retreating figure, that Dot would never have cause to suffer a heartache on his account. But then unfaithfulness to Dot was not among conceivable contingencies.

His strongest and most urgent impulse, as he saw the proud, erect figure disappearing and losing itself in the windings of the lane, was to scale that unscaleable wall and administer a sound thrashing to the dastardly lover dallying with his new mistress in the cool twilight garden. It would not be the first time Andrew had felt the strength of young Tom's arm; indeed, there was a legend still circulated in the Melchisford Grammar School of a terrific fight, in which the plucky little lower-form lad had challenged his senior, and had come off the hero of the occasion. Andrew had not loved Tom since that remote day, and Tom, remembering the circumstance that gave rise to that early encounter, was perhaps not wholly unprepared to find his old schoolmate playing the scoundrel now. But to thrash Andrew, delightful task as it would have been, would not restore Lavy's lost self-respect, or increase Mary's innocent satisfaction in her conquest. No, that pleasure must, at least meanwhile, be foregone. Tom thrust his tingling fists into his pockets, and allowed discretion to get the upper hand of valour by withdrawing from the scene of temptation.

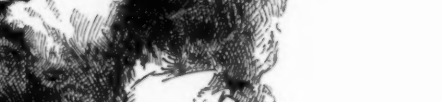
Meanwhile, not a hundred yards off, Andrew and his new companion were sauntering down the grassy slope that led to the pond. The house could not be seen from this hidden corner, nor could Hester's gentle music reach them. It was a green solitude such as love favours, and where the foolishest whispers were safe; but for the moment Andrew was silent. The truth is, our hero was getting a little bored by this nightly necessity for sentimentality which he had laid on himself, and took such opportunities as offered themselves to relieve its tedium. If Mary had only been even passably good-looking it would have been easier. Why was she so confoundedly plain? He half resented the poor girl's lack of comeliness, as if it were a personal injury. A woman ought never to be ugly. No doubt Mary would have elected to be pretty if she had had her choice; but Nature had settled the matter for her in very unkind fashion. Andrew's comparison was not unjust, though it was ungallant, when he likened her to a doll—one of those primitive dolls of a less sophisticated age that were cut out of one piece of wood, except for a rudimentary arrangement of the joints. She was almost as stolid as that treasure of forgotten nurseries; her joints seemed to work with the same jerking stiffness, and the colour in her face was laid on in one dull splash of red. Perhaps that was why he so seldom looked at her as they lingered in the garden, and why he was glad to find a vent for his boredom by flinging pebbles into the pond. He could see Mary Kelynge quite as well with the eye of imagination, for what he saw in her was sixty thousand a year, a fine old place, and a wife who would do as she was told and think as she was directed.

But presently he braced himself; he turned to her and bent his head, speaking with that air of devotedness he knew so well how to wear. He took the limp hand she never seemed to know what to do with in his own. How the colour burned in her face—the poor heart, how it beat! Why did not valiant young Tom spring over the wall and come to this poor victim's rescue? The truth is, neither he nor Lavinia knew how skilfully Andrew was steering between the lover and the friend: how nicely he was balancing his sympathy and calculating his affection, so that at the year's conclusion he could either drop at once into the avowed lover, or become merely the good-natured friend, according to the position Miss Kelynge was then called on to assume. In short, he was a great deal too clever for either of them.

When she got back to the bank-house her aunt was hovering on the stairs waiting for her, but Lavinia brushed brusquely past her. Her uncle's voice came cheerily from the open door.



"Well, Lavy, my girl, have you secured him?" But his only reward was the sound of the key turned sharply in her bedroom door.



"She's tired," said Mrs. Mellish, going back to her husband; "she doesn't want any supper."

"Ho! ho! So there's been a bit of a breeze! Well, well, lovers' quarrels soon blow over."

Mrs. Mellish said nothing.

## MILLET'S "ANGELUS."

MOST people who read the newspapers will have heard of the recent competition between France and America for possession of Millet's celebrated picture called "The Evening Angelus." The United States, which now absorbs so many of the great European works of art, was represented by two bidders, one of whom, it is said, was purchasing for the Museum at Washington. France, probably ashamed of her neglect of Millet during his lifetime—shown by the fact that the Luxembourg possessed but one of his works, and that the most unimportant conceivable—made a desperate sacrifice to retain this, one of the most characteristic efforts of his genius.

The great school of which Millet is perhaps the most eminent representative arose in France about 1830. As it considered Constable its precursor, his bold apothegm, "I intend to paint in God Almighty's style," devoutly construed, may serve equally well to indicate its aims and intentions. It believed the academic style and teaching ruinous and misleading. Nature, and Nature alone, should be the artist's master, and it claimed for every artist the right to interpret Nature according to his own personal impressions.

Without concerning themselves with politics, its professors were animated by a sentiment distinctly democratic. The banner under which they worked was inscribed with the words, "He hath put down the mighty from their seats and exalted them of a low degree." In the trunk of a willow-tree, in the banks of a suburban stream, in a corner of a copse, in a turn in the road, in any scene or object, however humble, they expected to find all the sweetness, the grace, the fragrance of Nature. It was in reality a movement akin to that which in poetry produced the English Lake school. There was the same delight in communion with Nature, the same love of simple ideals, the same disdain for what the world thought grand, the same belief in sympathy between man and the rest of the universe, the same supreme interest therefore in that portion of humanity which approached nearest to Nature: shepherds, woodcutters, and rural labourers of all sorts.

The rise of the lowly to consideration was thus heralded in England by a burst of idyllic poetry, the note of which has long been recognised as among the truest, purest, and most powerful ever struck; and in France by an Art

equally strong, simple, and still more profoundly touching, an Art which has influenced French and American painting as that of Wordsworth and Coleridge has influenced English and American poetry.

The leaders in this movement were nearly all of them youths, sons of artisans and small tradesmen, in some cases artisans themselves; most of them spent great part of their lives struggling with poverty. Jules Dupré painted chimney-pieces for fifteen francs. Théodore Rousseau sometimes sold a *chef d'œuvre* to get a little tobacco, Paul Huet, Lavieille, and Chintreuil for a time lived on the brink of starvation, while Millet and his wife were once two days without food, and for many years in frequent want.

Of all these men it might be said, to use Jules Dupré's own words, "He who rises, isolates himself." Of Paul Huet, Michelet wrote: "One day he painted a small water-bird sitting alone in a little bay, hidden by the woods. Looking at the picture, I said, 'It is himself.'" One of the very earliest of the school and a true type of the rest, this timid soul passed his short life in material misery and bodily weakness. From eighteen to twenty he lived on an islet in the Seine not far from Sèvres, a wild place, but just the spot to see extraordinary moonlight effects and others equally so of sunshine mingled with or after rain. Paul Huet did not see a Constable until two years after he had ceased to live on the isle Séguin, but his style was analogous.

While on the one hand it is very interesting to note the powerful influence so intensely English a painter as Constable has had on French Art, it is equally so to reflect that England did not recognise his great genius until France discovered it for us, and had actually presented him with a gold medal when his house in London was filled with unsold pictures which he had invited a careless world to see "gratis." Does Constable's success in France warrant us in believing that as early as 1825 there was a sentiment in the Paris Art-world ready to welcome the painter who went to Nature for his style? It is more than doubtful. More probably it was something like the interest Athens felt in the preaching of the Apostle Paul. The English painter's style was fresh and unique, and stirred for a moment the dead enthusiasm of a worked-out volcano. At best, Constable's success was like one of those genial weeks in early springtime which are to be followed by a long period of cold winds and biting frost. The followers of Constable got no gold medals and scarcely even the common decoration of every Frenchman of any repute until they were nearing the grave. Jules Dupré, who must to-day be named first among French landscape painters, entered the Salon in 1831, but was not admitted to the Legion of Honour until after the Revolution of 1848. Millet entered the Salon in 1840, but it was not until 1868 that the authorities recognised him as worthy the red ribbon given to endless people who make themselves known to the official world. When it was announced that Millet was named a chevalier of the Legion of Honour, the cheering was so overwhelming that the Minister of Fine Arts, Marshal Vaillant—it was under the Empire—did not know what to say. He was evidently taken by surprise. The year before they had just been in time to make Rousseau an officer of the Legion of Honour. He was on his death-bed, too ill to see the messengers who arrived with the news.

These men suffered, as all men must suffer who resist the ruling opinions of their day. They worked under a cloud. Their pictures were constantly refused admission to the Salon. As late as 1859 the jury at the Salon refused one of Millet's greatest efforts, "Death and the Woodcutter." The critics sneered at their work, and the public believed the critics. Thus these men, one of whose pictures is now a small fortune to its possessor, at times wanted the necessaries of life.

Corot said to his pupils, "Be conscientious; all Art lies there." This is exactly what these men were. They painted what they saw, no more and no less, and utterly repudiated as contemptible every trick of style, however popular. Millet and Rosseau lived in the woods like two seers, to whom disciples were drawn, anxious to know the true secret of Art. Millet was the more austere figure of the two.

Among those who visited them was the celebrated Art-critic, William Burger, who, as Thoré, a genius of the Revolution of 1848, had been driven out of France at the *coup d'état*. On his return he came to Barbizon to see his old friend Theodore Rousseau. Millet was a little shy and did not take to the visitor kindly, but one day he was drawn into quite a leading position in the conversation. The question discussed was whether the subject was of importance or not in a work of Art. Thoré affirmed that it was; the two painters, on the contrary, declared that the grandeur was in the thought itself, and that everything became great that was employed in a great cause. To illustrate what he meant, Millet said, "A prophet is sent to threaten a people with a judgment overwhelming in its destruction, and this is how God speaks by his mouth: 'I will send you palmer-worms and locusts, my great army.' And of their ravages the prophet gives such a description that no greater desolation has ever been imagined. Do you believe," continued Millet, "that if instead of 'locusts' the prophet had spoken of 'the war chariots of the King of kings,' he would have given a more powerful impression of the intensity of the scourge—a scourge so vast, so complete, that it extends to everything? The field is wasted, the land mourneth, the new wine is dried up, the old languisheth. Howl, O ye husbandmen and ye vine-dressers, for the wheat and for the barley; for the harvest of the field is perished." See how majestically the purpose of this desolation is made apparent, and how profoundly the imagination is struck by this Biblical method.

Well might Millet wax warm over this controversy, for on its solution depended the vanity or wisdom of his life. Indeed it affects the whole school, for the merit of most of its work turns on this cardinal point. What constitutes

THE EVENING ANGELUS. By J. F. Millet.

the elevation of a work—its subject or its thought? For answer, compare Millet's "Sower" with David's "Napoleon Crossing the Alps," Millet's "Woodcutter" with Paul Delaroche's "Charles I," and the veriest tyro in Art must admit that the real grandeur of a picture depends on the thought rather than the subject.

The Angelus is a splendid illustration of this truth. Lamartine has thus described the moment it represents:

"C'est l'angelus qui tinte et rappelle en tout lieu
Que le matin des jours et le soir sont à Dieu,
A ce pieux appel le laboureur s'arrête,
Il se tourne au clocher, il découvre sa tete,
Joint ses robustes mains d'où tombe l'aiguillon,
Elève un peu son âme au-dessus du sillon,
Tandis que les enfants, à genoux sur la terre,
Joignent leurs petits doigts dans les doigts de leur mère."[1]

The scene depicted by Millet was the Evening Angelus, and the main object he sought was to make the beholder think that he heard the very sounds of the distant bell floating through the air. Of course, it can only thus sensibly affect those accustomed to hear the Angelus from infancy. This had been the case with the painter, whose whole life, and, above all, his childhood, had been peculiarly affected by religious feeling. Thus the picture is, in the fullest sense, a production of the painter's soul, and reflects impressions which at that solemn moment in the day had possessed himself, his parents, and the long line of his peasant ancestors. The two simple figures, types of the great host of human workers, are standing in the midst of their labour, repeating the traditional words, "*Angelus Domini nuntiavit Mariæ.*" The extreme simplicity of the composition, and the vast, featureless country, are characteristics, both doubtless intentional, in a work which strives to make us feel the borderland between earth and heaven. But the chief medium through which the painter worked is the atmosphere—the least material of earthly things. Alfred Sensier,[2] who was one of the first to see the painting, says: "It is bathed in the light of the setting sun, one of those closes of day when earth and sky are all alike glowing and empurpled, and at the moment when the general tone of things has reached its most perfect harmony."

The Angelus was offered to speculators and amateurs in vain. After two months it was at last bought by M. van Praet, a Belgian Minister of State. What was given for it we cannot say, but a thousand francs would have been at that time about as high a figure as Millet ever got. After having passed through some hands, the Angelus was bought in July, 1889, by the French Government for no less a sum than 553,000 francs.

The picture was painted in 1859, and in the January of that year Millet wrote to his friend Sensier:

"It is a frightful thing to be thus exposed before these people—not so much because one's self-love suffers, as that one cannot get what is wanting. . . . We have wood for two or three days, but we do not know how to procure more, for they will not give it without money. . . . I am suffering and sad; pardon me telling you what I do. I do not claim to be more unhappy than many others, but each feels his own trouble. If you can worry the people who have any order to give I shall be more than ever obliged to you. . . . I am working at the drawings of Alfred Feydeau. Send me the money as soon as you receive it, for the children cannot remain without fire. . . . ."

In a once popular little book—Todd's "Truth made Simple"—a vivid picture is drawn of a world where all went by chance. Surely in Hafed's dream there is no illustration which can outdo this. A lavish nation gives more than half a million of francs for a picture which a few years before the author painted in constant fear lest his wife and children should die of starvation and cold; and—absurdity upon absurdity—not a penny of this preposterous sum benefits those whose sufferings enabled the picture to be produced, but this rain of gold is poured into the lap of some lucky speculator.

And yet there were men in Millet's own day who appreciated his greatness. Among them was William Morris Hunt, whose "Talks about Art" have been published in this country as well as the United States; Lavieille, the faithful delineator of Night; and Diaz, the painter of Sunshine. The latter, like Chintreuil, a master in this same school, overcame by persistent study of Nature defects that threatened to stop all artistic progress. The earlier works of Diaz were sombre in tone, dull in colour, heavy in touch, wanting both in brilliancy and transparency. In 1844 he saw one of Millet's works. "Here," he said, "is a new man at last—one who has the knowledge I should like to have, and the movement, colour, expression. Here, indeed, is a painter!" And Rousseau appears to have still more deeply interested Diaz. His hair was already grey, and he had been painting many years, but Diaz was not too proud to go and sit at the feet of anyone who would teach him how to paint better. He went to Barbizon, found Rousseau very reticent; but when the latter went out he followed him. At last he had courage to penetrate to the spot where Rousseau was sitting, and to ask him how he managed to paint such sparkling greens and cool greys. Rousseau explained to Diaz how he mixed his colour. It was nothing much, but what he said changed a man who could only paint Nature in a dull and heavy way into an artist, whose works seemed absolutely deluged in sunshine. Jules Dupré said, "No one knows better than Diaz the laws of light, the magic, and, so to speak, mad dance of sunlight

[1] Translated thus—

"The Angelus rings and everywhere recalls
That of each day morn and eve belong unto God,
At this pious call the labourer stops his work,
Turns towards the belfry and uncovers his head,
Joins his powerful hands, from whence falls the goad,
Raising for a moment his soul above the clods,
Whilst his children on the bare floor, bending their knees,
Link their little fingers in those of their mother."

[2] A helpful and devoted friend of Millet, and the author of a richly illustrated book on his life and works, from whence we derive our sketch of his portrait. A translation has been published by Macmillan and Co., and a more desirable possession for a young artist it would be difficult to imagine.

among the leaves and the underwood." And then he heaps up epithets and struggles with words to convey his idea of the works of Diaz. They are prisms, peacocks' tails, rainbows which dazzle one's eyes; a sparkling glitter, a cloud of luminous baubles, of golden atoms, as if a kaleidoscope were shaken; a mass of spangles, of precious stones, of flock-silk and unravelled chenille. Imagine the power that could effect such a transformation! How had these simple men got it? Simply by divesting themselves in their art of all worldliness, and having faith in Divine teaching alone. They were determined "to paint in God Almighty's style"—let us use the words reverently—nothing less, even if they and their families were starved to death.

Just as English society failed to see anything in Constable until the French Art-world discovered his greatness, so French society left Millet to starve until it was reported in Paris that a rich Englishman had settled in Barbizon and was buying up all his work. Then a halo began suddenly to surround his *tristes affaires*, people began to think there was something in them, and thenceforward their repute began slowly to rise.

But it was never great, either for him or for Rousseau, for they were not of the world, and the world cannot be expected to love those who will not even disguise their hostility by a decent veil of jocularity or cynicism. The world is more frivolous than bad-hearted, and not at all averse to the truths Millet wished to teach when agreeably administered in a syllabub of racy humour. But this peculiar ability, so overflowing in their English contemporaries—Dickens, Douglas Jerrold, and the author of "The Song of the Shirt"—was absolutely wanting in these two austere painters. "Do you know," said Thoré, "that they are terrible, Millet and Rousseau! They are like rocks; their ideas are immovable. They are just like two fakirs, and nothing can make them modify one of their opinions."

The fourth and fifth decades of this century will ever be lovingly remembered as a great period which produced quite a legion of noble souls deeply sympathethic with the sufferings of the poor and laborious. In some countries, like our own, this spirit shone most brilliantly in literature, but in France its highest achievements are to be found in the works of the painters at Barbizon. "Les Misérables" is one of the great books of the century, but even "Les Misérables" will not compare for true sublimity with some of Millet's paintings.

No whims in painting ever touched Millet; he held fast with stern tenacity to his doctrine—Nature, and Nature alone, is the artist's master; and he worked so indefatigably in her school that he arrived at expressing the suffering so profound imprinted in the very soul of things. And thus his works possess the very power that natural scenery and the humanity most closely connected with it have over the reflective soul. They elevate and purify in compelling us to be one with all that bears the burden of life.

RICHARD HEATH.

## New Year's Gifts.

WHAT shall we ask for, this New Year?
What are the gifts we count most dear?
What the desire and what the need?
What shall we ask who have passed to-day
Another landmark upon the way
High Love has decreed?

What should we ask for, verily?
The ear to hear, and the eye to see,
The tongue to utter, the hand to do;
The feet of swiftness; the spirit brave
To work and suffer, we fain would have
In the year that is new.

To laugh true laughter with those who laugh;
To weep with the weeping; to be the staff
For wounded and weak; and ourselves to rest
On hearts that are fain our hearts to bear,
And yearn so greatly to have their share
In giving the best.

Faith to take it and lift it up,
Even the awe of the dreadful cup;
Courage the mingling myrrh to refuse;
Patience to drain the bitter thing
Love only, after the swallowing,
With sweetness endues.

Or humbly to wear on the front the crown
Of love and honour and fair renown,
Taking duly the sweet and the good;
And, rightly judging, in all to know
Whether the keeping or letting go
Be as God would.

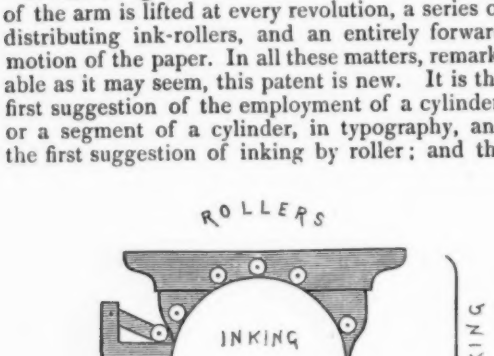
Oh, we know not what we should ask,
Holiday fair, or heavy task,
The rush of the race or the lying still;
So let us pray, nor pray in vain:
*Bid us, O Father, have our gain*
*In doing Thy will.*

EMILY H. HICKEY.

# THE CENTENARY OF THE ROTARY PRINTING PRESS.

WITH this 1890 the hundredth year will pass since machine printing, rotary printing, and printing by steam were first given to the world. Amongst the constantly growing crowd of centenaries and jubilees with which we are troubled it would be difficult to find one better worth remembrance. We are never weary of telling of the miles of paper that go roaring through the London presses in the small hours of the morning, but the true story of how it all came about seems to be little known. It is not to be found in the cautiously worded statements in encyclopædias and technical manuals; and it is only by much recent research among British and American specifications and other contemporary authorities that we have been enabled to correct errors of detail and date and supply missing links so as to realise the actual circumstances of the case. The story is not uninteresting, and it has much in it of what we are pleased to call human nature—the human nature tainted with meanness which we all profess to be so anxious to get rid of. In its way it is quite a stage drama, with its struggling inventor ruined by his own ingenuities, its middleman, and its tolerably honest second hero yielding to a sudden temptation and saving his reputation by an act of downright knavery, which he trusted never would be found out.

Some of us may be familiar with Nicholson's areometer; many of us have read of the Count Beniovski, or Benyowski, and his remarkable adventures in Siberia, Madagascar, and elsewhere; and more of us have heard of the Royal Institution in Albemarle Street; but it may be news to learn that the inventor of the areometer, the translator of Beniovski's memoirs, the author of the Royal Institution prospectus, and the inventor of cylinder and rotary printing by steam were one and the same man. This was the William Nicholson who in his day did an immense amount of miscellaneous literary and scientific work, who, with Carlisle, discovered the electrical decomposition of water, and of whom the biographical dictionaries say: "Wisely as he could decide questions involving the interests of others, he rarely was successful in undertakings of his own."



He was the son of a solicitor, and was born in London in 1753. In early boyhood he was sent to school in Yorkshire, where he certainly did not waste his time. But, Fellow of the Royal Society as he afterwards became, the spirit of adventure was fervent in him, and nothing would suit him but to go to sea. So in 1769, when London was full of Wilkes and Liberty, the discovery of the "torporific eel," and the ravages of Hyder Ali—"India stock fell above 60 per cent. in a few days"—Nicholson, in his sixteenth year, shipped on board an East Indiaman, and in her he made three voyages out and home. Giving up the sea, he entered the service of Josiah Wedgwood, the Staffordshire potter, and by him was given an agency on the Continent for the sale of the well-known ware. But the charms of the pottery trade, like those of the sea, failed to satisfy him, and, leaving the Continent, he came to settle in Soho Square as the keeper of a mathematical academy and a writer of books.

He translated, as we have said, the memoirs of Beniovski, "from the original MS.," a translation which had the singular fate of being translated into Hungarian, that Beniovski's countrymen might for the first time read of their hero in their own tongue. He translated, also from the French, a "Life of Hyder Ali," Chaptal's "Elements of Chemistry," Fourcroy's "Elements of Natural History," and Venturi's "Experimental Inquiries Concerning Fluids." He wrote a "Description of the Steam-engine" and "The English Mechanician," which were translated into French; and he also wrote a "Description of London Public Buildings," "The Art of Bleaching by Oxygenated Muriatic Acid," a "First Principles of Chemistry," an "Introduction to Natural Philosophy," and a well-known "Dictionary of Chemistry" (which was the basis of Dr. Ure's); but he did not write "The Navigator's Assistant," which was the work of a namesake of his at Chatham. In addition to all this, he projected and edited "Nicholson's Journal of Science," which lasted for seventeen years; and in the first volume of this, at the conclusion of his description of his invention of the printing machine, he very neatly remarks that "new undertakings are generally brought forward by the inventor—a man strongly prejudiced in favour of his leading pursuit—together with a moneyed friend, who hopes to speedily increase his capital from the abilities of the other."

Among his patents is one for making files by machinery; another is for a steam blast, on the injection principle, for furnaces and stills. How he came to invent a printing machine we have not discovered; probably, as a writer of books, it was suggested to him by the difficulty experienced by his printer in keeping a promise with the existing machinery. All we know is that he set to work on it in December, 1789, and that on the 29th of April, 1790, he took out his patent. The specification was sealed on the 29th of May of that year. It is No. 1748, and it is printed and can be found in its proper box in the Patent Library, or it can be bought for sevenpence at the Patent Office in Cursitor Street; or—and this is an important point in our story—it will be found in Vol. v., p. 145, of "The Repertory of Arts" for 1796.

Our illustration is from the drawing in the specification at the Patent Office. It will be seen that we have here three cylinders—one for the ink, one for the type, and one for the impression

—an ink-trough, from which the roller at the end of the arm is lifted at every revolution, a series of distributing ink-rollers, and an entirely forward motion of the paper. In all these matters, remarkable as it may seem, this patent is new. It is the first suggestion of the employment of a cylinder, or a segment of a cylinder, in typography, and the first suggestion of inking by roller; and the

1790 - PATENT No. 1748.

machine, so the specification says, can be driven "by steam," which is the first mention of the application of that new power to any method of printing.

The presses this one was designed to supersede were the old wooden hand-presses, on much the same principle as those in which we squeeze linen. The type was inked by being dabbed over with leather balls; it was laid flat on the bed of the press; the paper was laid flat on the type; the flat platen came down to give the impression; the power was got by means of a screw and a lever; and the paper was drawn out on the same side of the press as it went in at.

The patent covered the wide area of printing on paper, and fabrics, and floor-cloth. In type-printing, with which we are alone concerned, it showed how the type bodies could be shaped, like the stones of an arch, so as to fit into frames or chases adapted to the surface of a cylinder—which cylinder could be of wood, "or metal," another important suggestion. For the inking arrangement we may as well have the patentee's own words: "I distribute or apply the ink by causing the surface of a cylinder smeared or wetted with the colouring matter to roll over or successively apply itself to the surfaces of the type, or, in short, I may also apply the type to the cylinder. . . . . I apply two, three, or more small cylinders, called distributing rollers, longitudinally against the colouring cylinder, so that they may be turned by the motion of the latter; and the effect of this application is that every lump or mass of colour which may be redundant, or irregularly placed upon the face of the colouring cylinder, will be pressed, spread, partly taken up, and carried by the small rollers to the other parts of the colouring cylinder, so that the last will very speedily acquire and preserve an even face of colour." Nay more, "if the colour be very thin, I apply an even blunt edge of metal or wood, or other material, or a straight brush, or both, against the colouring cylinder, for the purpose of rendering its colour uniform." What a step is this from the ball method! "I perform all my impressions by the action of a cylinder. I cause the paper or material to be printed on to pass between two cylinders, or segments of cylinders, in equal motion, one of which has the assemblage of types on its face, and the other is faced with cloth or leather." And the way in which this can be done is shown in the numerous drawings in the specification. We have the machine all cylinders as given in our illustration, and, what was then of greater practical value, we have a machine in which the wedge-shaped type is abandoned, ordinary type used in a flat chase, and the bed of the press travels backwards and forwards, the impression being given, be it understood, by a cylinder, or a segment of a cylinder, having grippers for taking the paper round and releasing it. In fact, we have not only the principle of the rotary press, but that of all the modern printing machines clearly set forth.

A noteworthy invention! But in this country it did not meet with success. Either it was before its time, or the inventor could not find or trust "the moneyed friend hoping to increase his capital from the abilities of the other." But though the patent hung fire in England, it had not escaped the keen eyes of the wideawake Yankee. Isaiah Thomas, of "The Spy," the printer who set type at seven years old, who fought at Lexington, and sent Paul Revere on his midnight ride, wrote a history of printing in America. In the original edition of that excellent work, published at Worcester, U.S.A., in 1810, a copy of which is in the King's Library, we read that—"Some years since, Doctor Kinsley, of Connecticut, who possessed great mechanical ingenuity"—he invented a pin-making machine and a brick-making machine—"produced among other inventions a model of a cylindrical letter-press. It was a subject of much conversation among printers, but was never brought into use. The invention, however, did not originate with Kinsley. Cylindrical letter-presses were invented in 1789 by William Nicholson, of London, who obtained a patent for them in 1790. Kinsley's model was from Nicholson's plan with some variation. Nicholson placed his formes of type horizontally; Kinsley placed his perpendicularly; his method was not calculated for neat printing. Nicholson's presses were used, and, it is said, made excellent work. These presses require but one person to

work them, who is able to perform as much and more work in a day than two common presses. The workman applies a sheet of paper to the forme, turns the cylinder by a handle, the impression is made, and he has nothing more to do than to take off the printed sheet and put on another white one, thus continuing to print. The forme is blacked by the revolution of rollers properly prepared for the purpose."

The "Doctor Kinsley" was Apolios Kinsley. He patented his "cylindrical letter-press;" and the "some years" was sixteen years, the date of the patent being 16th November, 1796. The specification did not pass unnoticed. Not long afterwards there came the wheel-press of Benjamin Dearborn; on 1st February, 1810, there was patented Sawin and Wait's "circular printing machine"; on the 28th January, 1811, Sawin and Wait patented their "cylindrical press"; and then came other inventions on Nicholsonian lines.

Meanwhile Nicholson had sunk into difficulties, "owing to his many unremunerative inventions," and been lodged in the King's Bench. And here we can drop the curtain on the first part of our story, in which we have had the invention of the machine, its neglect in this country, its appropriation by the Americans, and the ruined inventor in prison for debt.

The second part begins at Luther's town, Eisleben, in Saxony, where Friedrich Koenig was born in 1775. There, in his little printing office, in 1806, Koenig and his friend Bauer were at work on the problem of how to print by steam. The problem as it presented itself to them was: Given the flat type and the flat platen, how are we to ink the type and bring down the platen on it so as to get just enough power and dwell, and no more? For years they had been at work, and at last they had found something which they thought "would do." But no German capitalist would hear of steam printing, nor would any Russian, as Koenig found on journeying to St. Petersburg; and as a last resource they resolved to try London. To London they came, and in Thomas Bensley, a prosperous printer of the day, they found their friend and capitalist. The machine they suggested seemed to him impossible, but he saw in it the promise of something better, and Koenig started to try again—this time at Bensley's expense. In 1810 the new machine was within sight. It was on the old principle of the platen and the flat chase, but it had the inking cylinders which had been introduced into printing by Earl Stanhope for his well-known hand-press, and, in 1807, patented by Brown.

The planning of the machine had been kept secret; to patent it the secret must be revealed. What was the best thing to be done? "Oh!" said a friend of Bensley, in reply to a general inquiry about patents, "want to know about patents? There's old Nicholson, in the King's Bench; he has had patenting enough—he ought to be able to give you a hint or two!" And, knowing nothing of the Nicholson proposal of 1790, off went Bensley and Koenig to interview the penniless man. They told him the nature of their invention. "Why!" said Nicholson, "I solved the problem twenty years ago!" "You did?" said Bensley, aghast. "Yes, and patented it. You will see it in the fifth volume of the Repertory of Arts." Bensley was "staggered," Koenig "could not believe it to be true," and off they went abruptly "to the nearest public library," and looked up the Repertory, and read the specification. "I thought it nonsense," said Bensley, "and could not wade through it!" "I read it through," said Koenig afterwards, in his published statement, "but after a few days I had forgotten Mr. Nicholson and his project!"

Bensley and Koenig saw Nicholson no more. They patented their invention on the 29th of March; its specification, No. 3321, boldly begins, "A is a press with a plattin, as in other presses." Nicholson sent them in a bill for the interview, and they paid it. In April, 1811, more than twelve months afterwards, they managed to print something on the machine they had made: the job was sheet H of the Annual Register for 1810. Of this sheet 3,000 copies were thrown off.

But that was all the machine could do. It was never used again. It was a failure. Koenig was sorely pressed; he was on the verge of ruin; he had been on the wrong scent entirely; the platen was impossible. Why not try Nicholson's impression cylinder? Nicholson was old, and poor, and friendless, and could do nothing; besides, it was only an idea, and anybody might have an idea! Why should he not have one? And he did—the same idea in fact; and he took it without a word of acknowledgment; and he even continued to claim it for his own, when he was at length asked for his answer. "Were you not aware of what Nicholson had done?" asked Cowper. "Sir," said Koenig, "I made a point of not reading anything that other persons had done in order that the machine might be entirely my own invention." "But," said someone, later on, "you had read the specification and seen the drawings?" "Yes, I did read it; yes, but it was not worth remembering, and the cylinder is my own invention, sir!" And at the same time it had already been attempted by others without the desired effect!

The platen was abandoned; the cylinder took its place; the machine was built, and it was a success. It was patented on October 30th, 1811, No. 3496. In the specification, "A is a press with a plattin" was now replaced by "B is the printing cylinder." It was completed on December 12th following, and by it there were printed sheets G and X of Clarkson's "Life of Penn"—the first sheets printed with an entirely cylindrical press—the papers of the "Protestant Union," and sheet M of Aiton's "Hortus Kewensis."

The machine was brought to the notice of John Walter the Second, the inventor of the "leading article," who was then sharing the ownership of the "Times" with his father. Walter had been thinking of such an invention for years. He had applied to Marc Isambard Brunel, of block-making machinery fame, to help him; but Brunel had not seen his way to solve the problem. In 1804 one of his own compositors, Thomas Martyn, had devised some such machine, when the pressmen had revolted and smashed it.

But Walter was not a man to accept defeat from those he employed, or discredit a principle because an example had failed; and soon he had another reason for looking about him. At the end of May, 1810, his pressmen went out for higher wages, and his compositors struck, not only for higher wages, but against the use of a new type then being introduced. Fortunately the strike took place on a Saturday. Walter, with a scratch team, had a day before him in which to print his next issue, and, to the surprise of the strikers, the paper appeared as usual on the Monday. The men were savage and revengeful, and for months the pickets kept the new workmen in peril of their lives, until in November twenty-one of the most violent were put on trial for conspiracy, and nineteen were found guilty.

Once again did a strike perform its useful function in improving machinery. Walter was only too glad to look at anything which lessened manual labour. He accepted Bensley and Koenig's invitation to see the press at work in Frith Street, Soho; he thought there were good points in the German machine, and, knowing nothing of the Nicholson episode, or Sawin and Wait, he delighted the partners by giving them an order. A new press with improvements was put in hand. Koenig and his friend Bauer were at work on it for three years in a building adjoining the "Times" office. Once, a significant anecdote tells us, they found the difficulties insuperable—the Nicholsonian notion was a delusion, then, after all?—and, disheartened, they slunk away, and no one knew what had become of them. But when they were sought out and brought back in three days, they found that John Walter had taken the matter in hand for himself and overcome the obstacle. Another patent was obtained—that of the 23rd of July, 1813, No. 3725. In it Koenig not only appropriated the cylinder, but also, by a similar process of unconscious cerebration, "the principle of affixing a board or any straight body against a cylinder for the purpose of spreading the ink," so that the machine had now the impression cylinder, the inking rollers, the straight-edge, and the travelling table of 1790.

The work progressed, in secret all the time, for Walter was mindful of Martyn's fate. On Tuesday, the 29th of November, 1814, at six o'clock in the morning, the pressmen of the "Times," who had been kept waiting on pretence that late news was expected from the Continent, were astounded to see him enter with the day's paper already printed. "It has been printed by steam in the adjoining apartment," said he. "I shall not want you any more. If any of you are violent, I have force at hand to suppress you; if you are peaceable, your wages shall be continued till you get another situation."

Six months afterwards, on the 21st of May, 1815, Nicholson died in Charlotte Street, Bloomsbury. "He made no claim," said the "Times," ten years afterwards—that is, as far as they knew. But, broken and dying "in great poverty," he was hardly in a position to make a claim with success, even if he had had an opportunity in prison of reading the new specification. The Koenig's patent on which he had been consulted was that of a platen machine, and this "Times" affair was built in secret, so that he only had the last half dozen months of his life in which to learn, from hearsay, that the new machine was no more like the old than chalk is like cheese.

Koenig was triumphant, but his triumph did not last long. He set to work on a machine for Bensley that would print both sides at once, and he patented it on Christmas Eve, 1814, No. 3868. It was a mere double of his single machine. But notwithstanding a florid prospectus in the best Barnumese, it proved to be too cumbrous to be saleable, and a quarrel broke out between the inventor and the middleman. There were recriminations; the cylinder was as much one's as the other's, and finally the capitalist took to advertising *Bensley's* machine! And in less than two years from that November triumph in Printing House Square Koenig shook the English dust from his feet and went back to Germany. With the "Times" machine he had run dry of ideas; he produced nothing else worth mentioning; and, as there were swarms of inventors and adapters all alive to the new condition of things, the march of invention soon left him by the wayside making money in Bavaria.

When he left the "Times" Augustus Applegath took his place. To Applegath printing owes much. He had a fine field for experiment, and he availed himself of his position to introduce every new idea he thought workable. The consequence was that in a very short time Koenig's machines were so improved that their own builder would not have known them. With Applegath was associated his brother-in-law, Edward Cowper. In 1812 Cowper and Applegath were in partnership as printers, printing tracts for the Religious Tract Society in Nelson Square, Great Surrey Street. On the 9th of July, 1816, Edward Cowper, then calling himself "ironmonger and mechanist," of Newington Butts, took out the first patent for curved stereotype plates. The description of his method is briefly as follows. A mould is taken in plaster-of-paris, and a plate cast in the usual way. The plate is then heated equally either by placing it in an oven, or over a charcoal fire, or immersing it in boiling oil, or by any other convenient method. The plate is then laid on a level board, with the face downwards, interposing between the plate and the board some soft substance—three or four folds of flannel will answer the purpose. The board, the flannel, and the heated plate thus arranged are passed together between two cylinders—a common rolling-press will answer the purpose.

A very different man was Cowper to Koenig. At the close of his specification he says: "As the method of printing by means of cylinders has been known some time, I claim no exclusive right to the use of cylinders as cylinders, nor for inking or colouring by means of rollers as rollers; but I claim the bending or curving stereotype plates, and printing with the same, paper never having heretofore been printed with curved stereotype plates."

On the 5th of March, 1818, Cowper, now calling

himself "a printer," took out another patent, this time witnessed, strangely enough, by Bensley, in which his new perfecting machine was fitted with the distributing-table and "end motion" of the composition inking-rollers. In 1815 Forster had found the Staffordshire potters dabbing on their patterns with lumps of glue and treacle. He took the mixture and made it into inking-balls. So said Forster. But Edward Dyas, printer and parish clerk of Madeley, in Shropshire, had another story to tell. Once upon a time, in his hurry, he had upset a glue-pot he had been using; and so intent was he on his work that he could not find his inking-ball, and in reaching out for it he seized the semi-liquid glue and with it inked a forme. So pleased was he with the result that henceforth "he used no other." And a completer and more doubtful version tells us how the same absent-minded Dyas popped the glue he was using into the treacle he was having for tea, and so discovered the advantage of combining the softening influence of the saccharine with the resiliency of the colloid. Whether it be Forster or Dyas matters little; enough that it was Cowper who stuck the glue and treacle round a core and gave us the composition roller.

So many were the improvements and additions, that in 1827 the much-altered Koenigs were removed from the "Times" office, and new four-cylinder machines took their place. Twenty-one years afterwards Applegath reinforced these by the two monster machines with vertical cylinders which we may regard as closing the first era of newspaper printing by steam.

W. J. GORDON

"If I were a beautiful bramble hedge,
I should not like to be set to grow
On a dusty road's ungrateful edge,
Where carts and cattle go to and fro.
The dust would cover my leaf and flower
Till they looked as white as the virgin's bower
That climbs and clambers by every way.
The children, out on their holiday,
Would pluck my berries before they were red;
And my leaves would wither, before they were shed,
At the touch of rude hands!" he said.

'If *I* were a beautiful bramble hedge,
I would be sad if I had to stay
'Mid elms and meadows where flowering sedge
And iris gleam by the water way,
Where the white sheep feed and the skylark sings,
And perfect peace has folded her wings—
Where no one passing would ever be
Made glad at the sight and the thought of me—
Where my berries would turn to black from red,
And my leaves would wither and fall down dead,
With no one to care!" she said.

"But in the winter, when skies are sad,
And berries are gathered and leaves are red,
Would you like the world to see, unclad,
Your ugly, cruel, black thorns?" he said.
"Folk might see my poverty! Should I care
If it made their own less hard to bear,
If my thorns might speak of the lovely hours
Of scent and sunshine, and summer and flowers?
Folk might say, 'Though the hedge looks brown and dead,
Yet the May will blossom, the rose be red,
When the hedge grows green!'" she said.

# THE SOVEREIGNS OF EUROPE.

## THE EMPEROR OF RUSSIA.

THE EMPEROR OF RUSSIA.

ON the 24th of April, 1865, the Russian Imperial family was plunged into mourning, for on that day died at Nice the Crown Prince Nicolai Alexandrowitch, after a painful illness, due to the effects of an unintentional blow inflicted by the present Czar in the course of some rough horseplay. This Czarewitch, a handsome, refined-looking man, had gained, thanks to his talents and personal charms, the love of his people, a people intensely, one might almost say fanatically, devoted to its royal house, which it looks on as semi-divine. It had been anticipated that this heir, who held enlightened modern views, would realise during his reign the hopes of progress so long caressed in Russia. And now a fatal blow, dealt by his own brother's hand, had laid him low on the very eve of his marriage, for he had been already betrothed with all form to Princess Dagmar, the bright, pretty, charming daughter of clever old Queen Louise of Denmark. The news of his illness had brought her to Nice, and here she tended like a sister of charity the man who loved her truly, and whom she loved in return. Nicolai's brother, Alexander Alexandrowitch, was also often by that bedside, devoured by remorse, deeply distressed at the certain loss of his elder brother, whom he adored and admired. It was a few hours ere the demise that the dying man turned to his brother and promised wife, and spoke his last wishes. Was it his purpose to testify his regard for his brother, to compensate his bride, at least, for the loss of a crown? Who can tell?

"I leave to you, Alexander Alexandrowitch," he said, "the heavy but glorious succession to the Russian throne; but I should like to add to it, also, a legacy more precious still, which will help you to bear its burden." So saying, he took the hand of the Princess Dagmar and placed it in that of Prince Alexander. "Marry her; it is my dying request and wish. And you, my dear bride, your destiny will be accomplished all the same; you will be Empress of Russia."

And thus it was. Eighteen months after the death of the Czarewitch, his brother and successor, Alexander Alexandrowitch, married Marie Sophie Frederique Dagmar, Princess of Denmark, who, in becoming Czarina and Grand Duchess of Russia, had to renounce her Protestant faith and her familiar baptismal name, to figure instead as

Marie Feodorowna,[1] the Russian rites admitting of no Christian name that does not appear among the nomenclature of its saints.

But Princess Dagmar was too true a woman, and had too sincerely loved her first betrothed, easily to accept the substitution he had imposed with his last breath. The mere title of Empress was not enough to attract or console her. It was only after long months of mourning that she at last consented to obey his desires. That she did not forget her first love is proved by the fact that one day, unexpectedly finding herself before a portrait of the dead Czarewitch, which had been purposely and maliciously put in her way, she fainted with emotion. Nor could her husband feel hurt at this touching fidelity, for was it not a guarantee the more for the affection his wife had sworn to him, and which from that hour to this forms the happiness of their two lives? For it was no easy crown Princess Dagmar was called to wear. Was it some inkling of the difficult fate in store for her that made her, on the morning of her departure from her father's palace, draw from her finger a diamond ring and scratch on the window-pane of her little simple bedroom, "My beloved Fredensborg, farewell"?

But whatever the Princess may have thought, the world holds that she has benefited by the change, for the present Czar is a noble and more sterling character than his brother. As a woman the Empress has every reason to be content. No breath of scandal or intrigue has ever clouded her marital relations; it is impossible to find anywhere a more affectionate and devoted couple than the Emperor and Empress of Russia.

Alexander Alexandrowitch was born at St. Petersburg in the Winter Palace, March 10th, 1845, the second son of Alexander II by his first wife. For reasons not quite apparent he was slighted by both father and mother, so that his infancy and youth were sad. His education proceeded upon strictly military lines, as is customary for the younger sons of the Imperial house, and he himself often expressed his pleasure to think that he was not the heir. "I am the *loustic* of the family," he would say; "I have no need to learn." Destined by education to be an officer of the Guards, not dreaming of other fate than to enjoy existence, guiltless of all scientific instruction, and of acquaintance with foreign tongues, so requisite in his exalted position, having none of the needful knowledge for governing, his position was indeed rendered difficult, when, at the age of twenty, he found himself suddenly, by his brother's death, heir presumptive to the Imperial crown of all the Russias. He had till then held himself much aloof from the Court. A man of uncompromising honesty, he made no effort to hide his indignation at the immorality and corruption rife there both among his relations and their surroundings. He was thoroughly out of touch with the *régime*, the tone that then prevailed, and, notwithstanding all her coldness towards him, he was further deeply shocked by the neglect to which his mother was subjected. When a few weeks after her demise (1880) her husband legitimised his union with the Princess Dolgorowky, the relations between father and son became more strained than ever.

The next year (March 13, 1881) occurred the tragedy on the Newsky Canal, when Czar Alexander II was murdered, and his son found himself upon the throne sooner than he had expected.

No one better than he grasped the difficulties of his position and his inadequacy to fill it, for the virtues of a private citizen, all of which he possesses, are but too often opposed to certain qualities required of a monarch. Hence he was possessed at first with an extreme timidity, which, joined to the native reserve and mistrust of his character, was not calculated to facilitate matters or to render him immediately popular. Indeed, with all his good qualities, Alexander III is not and cannot be a popular idol. Already on the death of his brother the force of circumstances had obliged him to put his hand without delay to his new duties, to interest himself in everything, to conquer his natural inclination for a merry idle life. Putting aside false shame, he admitted his ignorance, and became once more a schoolboy to fill up the lacunæ of his early education. Above all, he set about learning the science of government, for the serious side of his nature made him at once take seriously the duties that would devolve upon him.

Brought up among young officers, who had already begun the reaction against German sympathies, the Czarewitch had embraced these views. His marriage with a Princess of Denmark, the hereditary enemy of Prussia, had further fomented these antipathies. The Czarewitch was therefore soon pointed out as a zealous partisan of the national and Slavonic cause, as preached by Katkoff and his friends. These views often provoked severe conflicts between the Emperor and his heir presumptive, the one indolent and *laisser faire*, the other desirous to be respectful and conciliating, but withal easily roused to anger and hot-headed. When the Franco-German War broke out, the Czarewitch, together with all "young Russia," took part for France, and thus once again he was in acute opposition to the views of his father, an ardent admirer of his uncle, the King of Prussia. It not unfrequently happened that the Czarewitch left the dinner-table when the Emperor proposed a toast to the success of the Prussian arms. In the end, however, the disorders of the Commune shook his sympathy for France and for liberal ideas. He separated from his Slavophile and Gallophile friends, saying, with a sigh,

"It is thither such ideas lead."

Yet, notwithstanding the scant sympathy between father and son, Alexander III felt deeply the disaster that ended his parent's life. Not being a man of the mould of his forefather Nicholas, who could have beaten down Nihilism by the energy of his acts and the terror of his look and word, is it astonishing that he could not overcome the emotions aroused by the horrible deed,

[1] Marie, daughter of Feodor, this being the Russian form of Frederick.

and that hence during the first year of his reign he lived in almost complete retirement at his favourite country seat of Gatschina, near St. Petersburg, with his dear faithful wife and little children as sole companions? But the people grumbled, and quite low uttered the word "Coward!" when the Emperor made a rare appearance at St. Petersburg, followed and surrounded by a strong guard. It was further whispered that he wore chain armour under his uniform. Certainly, people were not permitted to approach him freely, as had been the case with the father. Nor was it evidently quite needless thus to surround himself with precautions, for various Nihilist attempts to blow up Gatschina, to murder now the Crown Prince, now the whole Imperial family, were not calculated to reassure a nervous and mistrustful spirit, inclined towards all the hereditary melancholy of the Romanoffs.

It was only after some while that the Imperial family reoccupied the Winter Palace at St. Petersburg, and recommenced those brilliant *fêtes* in which the Empress shines supreme. Marie Feodorowitch loves dancing, elegance, and gaiety to an excess that often draws down on her the reproach of serious spirits. The length of her dressmaker's bills, the costliness of her stuffs, the length of her trains even, provoke occasional remarks from her husband, who loves economy, and wishes his wife to set a good example in curbing the almost Oriental love of luxurious dress that prevails among the female portion of his subjects. But the Empress heeds his wishes little in this respect. Nor can she resign herself to the ravages of time and grow old with grace. Cosmetics and artificial aids to beauty are too much employed by the once simple Dagmar, who made and cut her own and her sisters' little cotton frocks. And it is to please this taste for gaiety in the wife he loves that the Emperor tries to second her in her pleasures, though he prefers a retired life; and often, after having for form's sake made a brief appearance at some *fête* where his wife dances madly, he will retire into his cabinet with some favourite general and discuss grave themes.

Those who have not witnessed a Court *fête* in Russia cannot imagine the gorgeousness and pomp that prevails, Oriental and almost barbaric in its crudity of colour and its overlading of ornament. Great variety too is produced by the many national costumes, stiff with gold and silver embroidery. The ceremonial that obtains is autocratic in its rigidity of etiquette. In all official Court ceremonies the ladies have to wear an adaptation of the national costume of the Russian Boyardes, consisting of a diadem crown with precious stones, to which is attached a long soft veil of white tulle, a low-necked dress with wide-hanging sleeves, and a long train of velvet embroidered with gold, which opens in front over a petticoat of white satin worked in silver. Those ladies who hold no official rank at Court may choose the colours of their costume according to their fancy, but the maids of honour, to the number of two or three hundred, wear their train and diadem in scarlet velvet, and on their shoulder the initials of the Empress in diamonds on a blue ribbon. Each one of the Grand Duchesses has her especial colour fixed for her by rule, which must also be worn by ladies of her Court; and the etiquette is so strict on this point that even the slightest deviation in *nuance* provokes a serious reprimand. These *costumes d'honneur* are a heavy expense, representing a sum of one to two thousand roubles, and are often handed down from one family to another.

If the ordinary Court festivals admit of such luxury, and are submitted to such rigid etiquette, what is the splendour of public ceremonies!

Among these, during the present reign, the coronation of the Emperor in the mother city of Holy Russia, on the 27th May, 1883, has been the greatest; a marvellous phantasmagoria, where all the traditional treasures of the Muscovite Empire, all the wealth and brilliant colours of Asia, were displayed to do honour to a day solemn above all others. Very visible was the emotion of Alexander III, seated on his little white horse, his faithful companion in the Turkish War, as he entered triumphantly into Moscow, the people shouting frantically, and the fifteen hundred bells of the city filling the air with their brazen harmony. On arriving at the Kremlin Square seven thousand chosen voices, accompanied by a monster orchestra, intoned the grand national hymn, the Prayer for the Czar. "I truly felt, as I heard the strains," said the Emperor, "that I was wedding my people." Behind him followed the Czarina, clad in a cloak of silver, and seated in a golden coach, accompanied by the tiny Grand Duchess Xenia, whose baby hand threw kisses to the soldiers and the crowd. Careful observers noted that Marie Feodorowna's face wore a look of anxious tenderness as her eyes followed her husband, who was traversing the crowd, and truly fervent may have been her prayer for his safety as they both knelt, according to usage, in the celebrated sanctuary of our Lady of Iverskoi, which they passed on their triumphal route. The same ceremonial of alighting and kneeling to pray was repeated before the venerated *Rosto* of the Saviour, where every passer-by is expected to uncover before the image of Christ, which, according to tradition, arrested an invasion of barbarians. It is said that when Napoleon I entered Moscow, he determined to brave the established rule, but as he passed with covered head under the sacred arch a gust of wind carried off his hat, so that he was forced to pass bare-headed before the sacred image.

Great were the hopes and fears that revolved round this important day in Russia. Intensely superstitious as are its people, they saw presages of all kinds in various incidents that occurred. Thus, the day was rainy—a bad sign; but each time the Imperial couple traversed the Kremlin Square, as they passed from one cathedral to another, the sun broke through the clouds as though to salute them on their passage, while during the great banquet that followed the coronation one of the Kremlin pigeons—the bird held sacred in Russia as an emblem of the Holy Ghost—came flying through a window of the great hall, and, after whirling about in bewilderment above

the gilded crowd, alighted on the Imperial daïs, beside the two-headed eagle; "wisdom and sweetness beside might and force," said the people.

But, although everything went off well, the Imperial family were relieved when, at the end of the two brilliant and exciting days of the entry into Moscow and the coronation, the Emperor regained his private apartments safe and sound, and could remit to his treasurer the crown of diamonds and the ancient heavy sceptre of Holy Russia, surmounted by the famous Orloff diamond, the largest in Europe. After all these Court *fêtes*, with their fairy splendour, their solemnity, came the turn of the people. Among other popular festivities was a banquet where five hundred thousand individuals each received, in presence of their sovereign, a basket containing a large meat patty, a sweet dish, a bag of bonbons, and a goblet on which was engraved the arms of the Czar. In the latter they were to drink the beer that flowed in rivers. It is only in Russia, where space is abundant, that similar *fêtes* can possibly be conceived or carried out without either disorder or crowding. Eight days after, on the same immense ground, was held the great military review, where all the regiments of the Russian army were represented; and those who have seen these splendid Russian troops, with their suppleness, their discipline, their force of resistance, feel assured they would not prove wanting in the hour of battle.

"Hail to you, my children!" cried the Emperor, as his eye surveyed the scene.

"We will do all we can to content your Majesty," replied the soldiers, in chorus.

Then began the defile, which, for the splendour of accoutrement, the variety of national types and uniforms, has not its equal in Europe. Here were the Presbajaisky, the first regiment formed by Peter the Great, and recruited among the friends of his childhood; the Sémémowsky, all blue-eyed; the Paulowsky, with *nez retroussés*, the favourite regiment of Paul I, decked with large golden mitres lined with red; here, too, the infantry of the line, the artillery galloping past with a noise of thunder; while last of all, in a cloud of dust, arrived the Cavaliers of the Guard on their superb steeds, wearing their winged casques. They halted before the Emperor and Empress, and then divided to give place to the Blue and Gold Guards of the Empress, to the Grenadiers and Lancers, the Red Hussars of the Emperor, and many others, more than we can name, not to forget the fiery Cossacks on their mettlesome little ponies, who carried off the prime honours of the day, ending the *fête* with their marvellous equestrian games and feats.

Military discipline has improved much under Alexander III. A soldier himself, he knew where lay the strength and weakness of his army. For example, he insists that the young officers should become the instructors of their men, not only in matters connected with the service, but in the arts of reading and writing. Thus these brilliant youths are no longer useful merely for balls, but are also of active service to their country.

We repeat, whoever has not seen Russian *fêtes*, of whatever nature, can form no idea of their sumptuousness, which recalls the marvels of the Arabian Nights, and which has, at the same time, a touching and patriarchal character. The sentiments of religion and of submission to authority are profoundly rooted in the hearts of the Russian people; their love for their God and for their Czar, who to them is the representative of God on earth, are for them almost identical. On their part the present Emperor and Empress are unassuming in their private life and habits, full of kindliness for their people, among whom they love to mingle without pomp or *entourage*. A thousand traits of their familiarity are related, and of the childlike simplicity with which the populace falls down in the dust to kiss the traces left by the Imperial carriage. They call their sovereigns Batouschka and Matouschka, which means little father and little mother. They admire the monarch with his martial bearing, his herculean strength and muscle, his eyes that look straight and clear, the expression of regal goodwill that at moments lights up his somewhat too placid face. The charming Empress, vivacious, good, and graceful, gains all hearts by her sweet smile, exercising a fascination in which the woman triumphs over the sovereign. A Pole, whose nationality ensures his good faith, once said, "If the enemies of the Czar knew the Czarina, they would not have the courage to make him weep."

In this huge empire, containing so many discontented subjects, no word is ever spoken against the Empress. She carefully keeps outside of politics; indeed the Emperor does not confide them to her knowledge; but she shares his German antipathies and his liking for France. While remaining Danish, she has known how to become Russian besides, and to embrace Russian interests, and such public influence as she has over her husband is always exerted for good. She is a tender and anxious helpmate to him in his difficult position, who never leaves his side, accompanies him on all his journeys, shows no weakly fears of the charged mine ever under their feet, and keeps up his spirits by her own buoyancy of temperament. Like her mother, she often visits the public schools; but as her visits, unlike her mother's, are always announced beforehand, the girls are prepared to answer the questions her Majesty will put to them in French, and which are almost always the same. The ceremony ends by giving the pupils a three-days holiday in the name of the Emperor. A great number of charitable institutions are under her protection, and wherever and whenever there are hearts that suffer they turn hopefully to Marie Feodorowna. Her *rôle* in this great empire is to console, to enliven, and to make herself loved. A brilliant woman of the world, who likes to shine and to enjoy herself, the Czarina is neither light-minded nor frivolous. She is, above all, a good wife, a good mother, and a true friend. She has tried hard to conciliate the hearts of her husband's family, with almost all of whom he is on bad terms. He is too upright, too conscientious and

straight to tolerate the frequently crooked ways and somewhat Oriental notions of honour of his relations.

We have said that the Court *fêtes*, beloved and encouraged by the Empress, are brilliant in the extreme, and yet it is said that they are less splendid than under the former reign. The present Emperor is economical and discourages useless expenditure. He is said to have inherited this trait from his mother, who, though charitable to the poor, was too parsimonious for a sovereign. Alexander III has reduced by a third all the allowances of the Imperial family, has diminished and even abolished the innumerable heavy pension and favour lists with which his house is weighted, and which, during former reigns, had attained the proportion of a huge system of abuse and *exploitation* of the rich and squandering upper class at the expense of the poor and hard-working taxpayer. And undoubtedly the Emperor has done well in this, though those whose means have been thus straitened are naturally loud in their laments. The chief to complain have been his brothers, who love good living and gay society. Nor must it be overlooked that the Emperor began by setting a good example, reducing his own private budget and cutting down useless expenses in his household; and almost incredible tales are told of what useless expenses may mean in a Russian and an Imperial household. Thus, in the days of Nicholas, the Empress, having a cold, once demanded a tallow-candle, to apply to her nose that homely remedy. None was to be found in all the palace; but henceforth, in order that a similar lack might not recur, it was decreed that forty pounds of tallow-candles should be bought monthly. Whether bought or not does not appear, but until this reign the item figured in the Imperial household expenses. It is told of the present Czar that he often goes out alone early in the morning to inform himself of the real price of provisions in order to check the accounts laid before him. He never loses an opportunity of asking what some homely domestic item costs.

One of Alexander III's salient characteristics is his rigid honesty, his hatred of the money malversation practised, under previous reigns, by Government employés, great and small, malpractices that in his father's time attained enormous proportions and excited public indignation. Mistrustful of those interested influences which had caused the misfortunes of his father, Alexander III has known how to surround himself with men irreproachable on this score, but who, unfortunately, on the other hand, do not permit any truths, any requirements of modern times, not in conformity with their own ideas or in harmony with the Emperor's views, to come to his knowledge.

Few persons have any idea how conscientiously the Emperor of Russia works, of the care with which he examines every paper submitted to him for signature. Yet this very care, this very attention to items, is utilised to their own ends by those surrounding him and by his ministers. These latter encourage him to absorb himself in the examination of petty Government details, while depriving him of the conduct of more important concerns. For Alexander, himself a straightforward man, incapable of double dealings, not only by instinct, but also by small brain power, never suspects when he is played upon. A sort of Chinese wall separates the monarch from all those who could transmit to him the thoughts and wishes of his people, who could instruct him as to the reforms they have a right to demand, for the internal administration of Russia is an evil that cries aloud to Heaven. Therefore, though he has the most earnest desire to be a good monarch, full of the mission to which he firmly believes he has been specially called by God, conscious of such responsibilities as he has realised, only afraid of doing what seems to him to be wrong, little is to be hoped for Russia under the *régime* of the present Emperor. His absolutist leanings, narrow-mindedness, and consequent self-sufficiency, close to him all the quarters whence he could have learnt a lesson from his great-uncle, William I of Germany, who, though not himself a great man, knew how to surround himself with great minds, and to allow them free action. Aware of his want of perspicacity regarding men, Alexander III shrinks from mixing with them. He is afraid lest some word should escape his mouth which might be turned against him by indiscreet reporters. He tries to do his duty to the best of his ability, but this ability is, unhappily, much circumscribed; a fact of which he is dimly aware, but of course cannot estimate to its full extent. It is unfortunate, therefore, that he insists on directing in person the internal and external policy of the empire. Of course, not even he could do without a helper. He required a careful, intelligent co-worker, *au fait* with all a Czar has the right to ignore, aiding him by his memory and good sense, and able, if need be, to give him advice, but at the same time not aspiring to impose this advice nor to attempt to influence his master. This co-worker and chief interpreter of Alexander's thoughts in the matter of foreign policy is found in M. de Giers, a coadjutor with whom his employer is entirely satisfied.

The bearer of a German name, M. de Giers is an excellent Russian patriot, and, though the Emperor knows it not, he does exercise influence over him, if only by keeping in check the overpreponderance of the Slavonic party, whose chief is M. Pobedonostzeff, proctor of the Holy Synod, and former tutor to the Emperor, a man in whom he confides. M. Pobedonostzeff does not lack intelligence, but his mind is of the narrowest; he is a fanatic and a reactionary, whose ideal is that Russia should become again what she was in the days of Peter the Great. He would draw an impassable barrier between her and Europe. Individuality, independence, he holds in detestation. According to him, all good Russians should spend their days crossing themselves before the sacred images and bowing before the Czar. It has been said of him that he is a Slav Philip II. Happily for Russia, the headstrong nature of the Czar prevents his succumbing to this man's influence. Alexander likes to make up his own mind, and

the very fact that M. de Pobedonostzeff presents him with conclusions cut and dried weakens his power to sway his Imperial master. The Emperor does not arrive at decisions quickly; but when he does, like all limited intelligences, he holds to them with tenacity, and, even though circumstances may have changed meanwhile, no power on earth can induce him to relinquish them. Incapable of taking other than short views, it is this which makes him to a certain extent dangerous to Europe, for he might bring himself to imagine war was a necessity, and then declared it would be.

THE EMPRESS OF RUSSIA.

To see the Emperor to best advantage, he must be sought in the bosom of his family. Indeed, whatever he may think of his divine mission, nature cut him out for a simple bourgeois. Both he and his wife are never happier than when they can leave all State cares behind them, throw off the yoke of etiquette, and live for their children at Gatschina, at Peterhof, or, best of all, in Denmark, in which country the Czar unbends in a manner never seen elsewhere. There is not so great a romp as he among all his nephews and nieces; he is master of all the childish revels. To these Princes and Princesses the autocrat of all the Russias is simply "Uncle Sasha," and cries of "Uncle Sasha! Uncle Sasha!" resound all over the place. A favourite pastime of his is to stand amidst the merry throng and challenge them to pull him down. But they never succeed, either separately or united. The Czar has most wonderful strength of muscle. He can bend a horse-shoe or strangle a bear by mere force of hand. Once while in Denmark, when a conjurer was showing his skill, the Czar offered to produce a specimen of his own abilities: he took a pack of cards and tore them through with the greatest ease. At Gatschina he loves to go fishing with a harpoon by torchlight. Like Mr. Gladstone, he is fond of felling trees, but, unlike that gentleman, he equally enjoys sawing them into lengths.

The Czar has five children, three sons and two daughters. The Empress has her daughters much with her, and has not even a so-called governess for them. Her own personal attendant and her lady of honour serve also for them. In part, this

springs from the Emperor's love for simplicity of life, but in part also that they try to surround themselves with as few people as possible, so that as little as may be concerning their private life should transpire to the outer world, of whom they are, and not without good reason, much afraid. The Empress superintends in person the education of the two little Grand Duchesses, Xenie and Olga, aged respectively fourteen and six. The Emperor in his leisure moments tries to do the same for his boys. Especially he loves to give them music and dancing lessons, for he thinks himself a great musician, and has a predilection for the cornet-à-piston. One day a minister, busy reading to him an important document, beheld the Czar vanish suddenly to intone in the adjoining room a rhapsody on his favourite instrument. "Excuse me," he said, returning after half an hour, "but I had so lovely an inspiration." He takes care, however, that they should also have better instruction than he can give them, remembering how his own education was neglected, and how disastrous this has been for him. His eldest son is his especial care, but the Czarewitch seems to have little aptitude for study, and rarely satisfies his masters, either by his private conduct or by his application. Nor has he in his person any of the fine bearing of the Romanoffs. He is pallid, frail, and nervous, and great anxiety is felt concerning his health.

The Emperor is subject to attacks of uncontrolled fury. Even the Empress herself has to suffer under them. It was such an attack that gave rise to the story which went the round of Europe that he had killed one of his aides-de-camp. The following is the correct version. It was at the time that great Nihilist excitement prevailed, and in the Imperial household plots and sinister attempts were beheld in reality and in imagination. Now the aides-de-camp are forbidden to smoke in the Emperor's ante-chamber when on duty. It happened that after dinner one of the gentlemen, finding the time long, lighted a cigarette. Alexander came up unexpectedly at that moment, and, seeing a spark and smoke in the dim light of the falling day, without stopping to consider the innocent cause of these phenomena, thinking himself the object of a Nihilist outrage, fell upon the officer, shaking him with fury, the frightened aide-de-camp meanwhile crying aloud for help. A moment, of course, sufficed to clear up the matter, and the officer soon recovered from the effects of the Emperor's angry violence. Still, the world reported him dead, and the Emperor heard of this. He therefore took occasion on their next public meeting to address his so-called victim with, "Mon cher, how do you find yourself since I killed you?" Like his grandfather Nicholas, from whom he inherits this tendency to rage, he is often sorry after, and tries to make good his errors.

A favourite pastime of the Emperor's is the theatre, and in connection with this a fact recently occurred which is yet another proof of Alexander's tenacity in having his wishes carried out. A new opera by Rubenstein, "The Merchant of Kalaschinkow," had been prohibited by the ecclesiastical censorship, although the Emperor had accorded permission for its performance. The theatrical manager complained to the Czar, who was greatly annoyed that the censorship had acted without advising him. He resolved to judge for himself, and caused the opera to be played for him alone; and, finding nothing objectionable, notwithstanding the ecclesiastical veto, commanded its public representation. It may be that this opera found special favour in the Czar's eyes because its music has, beyond all else written by Rubenstein, a truly Slav character, for Alexander is loud in his boasts of loving and admiring only what is Russian. He values the national artist Bogoluboff highly, who is his *peintre attitré*, as well as the Hungarian Zichy, who is his personal friend, and often accompanies him on his journeys, for the Emperor has a certain love for the arts and artistic things.

Well is it for the Emperor that he is so happy in his domestic life, for from his relations, whether brothers, uncles, or cousins, he derives little pleasure. Indeed, with his eldest brothers, Wladimir and Alexis, his relations are most strained, and the Czar makes no pretence of concealing his sentiments towards them. He thoroughly disapproves of their mode of life, their conduct, and the people with whom they associate. What further particularly offended him was their failure to return to Russia on hearing of the horrible railway disaster at Borki. The catastrophe had been so terrible, and the destruction of the Emperor, the Empress, and their children so narrowly averted, that it was only natural to suppose that the Czar's brothers would hasten to his side for the purpose of congratulating him on his providential escape. The Czar considers his brothers as the first among his subjects, and that they above all must not neglect the honour and consideration to which he holds himself entitled. Indeed, the Imperial household statute exacts that each member of the family owes to the reigning monarch, as chief of the House and as autocrat, "entire respect, submission, obedience, and subjection." They, however, preferred to remain at Paris, and none of the Czar's relatives were present at St. Petersburg to take part in the unparalleled display of loyal enthusiasm which attended the popular welcome-home of the Imperial party after the accident.

The Grand Duke Wladimir is married to a Princess of Mecklenburg. She has proved the first Princess who, marrying a Russian Grand Duke, has evaded the law that obliges these ladies to embrace the Greek faith. On her arrival at the frontier she was met, as is the custom, by a pope, who sprinkled her with holy water. She recoiled in horror, asking if by this act she was made to enter the Russian Church by force, for she would not be forced, but would only cede to convictions formed after studying the Russian dogma. It seems that these convictions have never come to her, and she has remained a Protestant in defiance of the Imperial household law. This lady is popularly regarded at St. Petersburg as a secret agent of Prince Bismarck. She tries to ingratiate herself with the

Empress by giving many balls. It is she who has introduced the game of roulette into St. Petersburg *salons*, for which she has been much criticised. Over her husband she exerts great influence, and employs it to inflame the ambition of Wladimir, who thinks himself the first personage of the empire. Both husband and wife are jealous of the Emperor and Empress. Wladimir had been the favourite of his mother, who thought to prophesy when one day she announced, after the death of her first-born, "It is Wladimir who will be Emperor, not Alexander." For the good of Russia, it is well that this so-called prophecy has not been fulfilled.

The Empress has a preference for the society of her sister-in-law Elizabeth, Princess of Hesse, daughter of the late Princess Alice of England, and wife of the Grand Duke Sergius, a charming young woman, devoid of social influence, but whose amiability wins all hearts. She is not happy in her union with the most unpopular of the Emperor's brothers.

The Grand Duke Alexis, the sailor-prince of Russia, is a gay cavalier in great favour with the ladies. The fifth brother of the Emperor, Grand Duke Paul, is a permanent invalid, and rarely at St. Petersburg. His future marriage with his cousin, the Princess Alexandra of Greece, has been greeted with sympathy in Russia. The only sister of the Czar is the Grand Duchess Marie, Duchess of Edinburgh. She much resembles her elder brother in disposition, having not only his narrow views, but his uprightness, his almost physical horror of a lie. Neither attractive nor gracious, of inexpressible hauteur of manner, she has not known how to make herself popular in England, but those who know her in her small circle of intimates esteem her.

The Emperor's three uncles, Constantine, Michael, and Nicholas, have almost vanished from Court circles since this reign, and have lost all influence. Constantine is ex-vice-King of Poland, where he and his wife made themselves cordially detested. Under the former reign he was always at the head of the opposition factions. He and his brother Nicholas disgraced their position by the gross scandals in which they were implicated at the close of the Turkish War, when they were shown to have been the recipients of enormous bribes from fraudulent army contractors. The notorious Grand Duke Nicholas Constantinowitch is virtually exiled from Russia, holding a post as chief of a regiment in Turkestan.

Grand Duke Michael, married to a Princess of Baden, is the only one of the Czar's uncles who is above reproach. The worthy couple, however, always live in the Caucasus, where they have made themselves beloved.

A favourite Imperial residence is the castle of Spala, in Poland, where Alexander III usually spends the month of September to enjoy the shooting. But this palace has yet another attraction, for close by is the little parish whose Roman Catholic priest, Ludovic Zumdowski, is an old and devoted friend of the Czar's, whose acquaintance he had made while Grand Duke, hunting in these parts, and for whom he conceived a real affection. Indeed, he often came here for the sole purpose of conversing with his friend, so often, truly, that the late Emperor, Alexander II, fearing the influence of a Polish priest over his son, forbade these visits. But once in power himself, Alexander III made every effort to persuade his friend to come to St. Petersburg, and when he absolutely and repeatedly refused, not wishing to quit his humble parish for the great world, the Emperor built himself this castle of Spala, where he can enjoy his friend's society and forget State cares and ceremonial. This priest is a good, simple-minded man, of some intelligence, energetic, and fond of action, who in his youth had seen the world. It is to this man that the Czar confides his secret cares and joys, with him that he confers without reserve. It is known that Zumdowski makes use of his influence to solicit favours for his poor, but is he also the political counsellor of the monarch? Does he hope to obtain some day concessions in favour of Poland? He loves France and detests the Germans. Does he help to augment this bias in Alexander III?

The chief friends and companions of the Emperor, General Tcherevine and Count Daschkoff, are equally Russophile, Francophile, and Teutophobe. It cannot be denied or overlooked that Slavophile leanings accentuate themselves more and more in Russia, and are encouraged by both Emperor and Empress, though with prudent reserve on account of their positions. The feeling is chiefly hitherto devoted against German immigration. The country is overrun with these strangers, who have penetrated into all departments, but who have never identified themselves with the people among whom they live, but whom they too openly despise because of their inferior education. Russians on their part accuse the German Socialists of having been the first in Russia to sow the seeds of discontent and revolt against authority. In reality, it is an antipathy of race which even the German-loving Alexander II could not overcome, and which threatens any day to become a cause of European carnage. Happily, an aggressive policy is not in favour with the present Czar, who is a man of peace and prudence. It is to be regretted, however, that in their zeal to russify Russia the Czar's advisers insist on forcing the Russian religion upon the people's consciences in those districts that have ever been Catholic or Protestant, such as Poland and the Baltic Provinces. The former are accustomed to oppression, to the latter it is new; and this may drive them into the arms of Germany. Curiously enough, this mistaken policy is not pursued in the newly-acquired Asiatic possessions. Here the people are allowed to retain all their privileges and the free exercise of their religions. The Government has even gone the length of restoring ruined mosques and building new ones where these were lacking. Trade is encouraged, works of irrigation are founded, railways are built, sterile tracts are rendered fertile. Hence in these lands the name of the "White Czar" is blessed among the peoples, who under him taste of security, freedom, and juster rule than under their former masters.

Another fanatical Slavophile in the immediate vicinity of the Czar was the late Count Tolstoi, who was Minister of the Interior. Of upright nature, energetic, full of his duty towards God and the nation, going straight to the goal he fixed for himself without flinching, the great aim of his life was to stem German preponderance, to make the Greek religion triumphant, and to enable Russia to live on her own resources. To him is due indirectly the great increase of Nihilist views among the students, to whom he made himself hateful while Minister of Public Instruction.

For modern ideas cannot be wholly excluded even from Holy Russia, notwithstanding censorship of the press, tampering with private letters, espionage of all sorts and kinds. Nor does the Emperor himself wish to restrict education; he only wishes that its results should lead to given conclusions, and this is not possible. As the homely proverb has it, "You can lead a horse to the water, but you cannot make him drink." Slavophile and retrograde thinkers cannot be made to order. During the present reign primary schools have increased in number in St. Petersburg from sixteen to two hundred and fifty, and they are beginning to penetrate even to the villages.

One of the first acts of Alexander's reign was to destroy in part the work on which his father based his claim to national gratitude—*i.e.*, the liberation of the serfs. He declared that the Government would not continue to buy up the land for the peasants, as had been done since their liberation, affirming that the peasants abused this privilege to satisfy their own cupidity, and that, further, it too much impoverished the proprietors. Instead, he has founded a Mortgage Bank, out of which the State furnishes the nobles, at little cost, with the means of keeping up and cultivating their lands, for since work is free it becomes daily more costly even in Russia, whose peasants emigrate in numbers to Asia. Yet another bank, also under State protection, supplies the peasants with facilities for paying their rent and buying land. Manufactures have, too, been encouraged under this reign, and made great strides; and the inexhaustible mineral wealth of Russia is at last being turned to some account. Still, much remains to be done in Holy Russia, and the accident at Borki, which has opened the eyes of the Czar to the careless—not to say dishonest—administration of his railways, may also make him perceive that in other departments also there is much that halts.

This railway accident, which some persons tried to convert into a Nihilist attempt, but which was undoubtedly a *bonâ fide* case of gross mismanagement, seems likely to have important results for the land. It has certainly immensely increased the popularity of the sovereigns, who, themselves hurt, behaved with admirable fortitude and self-denial in aiding those more severely injured. For once etiquette broke down, and master and servants were men and women together. There were twenty-one dead and thirty-six wounded on this occasion from an accident, the mere result of jobbery and bad workmanship on the one hand and servile adulation of the Czar on the other, no one having the courage to tell him that on this bit of the line the train must not go at the full speed he always demands. When the shock occurred, the Empress, with a scream of despair that rang in the ears of those that heard it for many a long day, cried out in French, "*Où sont mes six?*" meaning her husband and five children, while the Grand Duchess Xenia, thinking it must be a Nihilist attack, called out, "Do not kill me, do not kill me," and ran for protection to an officer. Among the dead were many of the Czarina's favourite attendants, for whom she has never ceased to mourn. She herself received a deep wound on her arm, a fork having run into it, for the Imperial party were at table at the time.

This wound has left behind it a nervous trembling of the arm, while the accident itself proved to have given her nervous system a severer shock than at first appeared, when she bore up so bravely. A sad period of nervous prostration followed, and some feared for her the fate of her sister Thyra. This terrible malady has, however, been averted; the Empress's naturally good health and high spirits have reasserted themselves, and whenever occasion offers she dances as madly as ever, and continues to hold receptions and *fêtes*.

A loss to the Emperor, at Borki, was that of his pet dog Mahzutcha, a Siberian long-haired greyhound, who always slept at his bed-foot, and was his constant companion in his study. When audiences lasted longer than pleased the Czar, or Mahzutcha, she had the habit, on a sign from her master, of pulling at the coat-tails of the importunate visitor. Among the few objects not smashed to atoms in the Imperial carriage was a picture of the Saviour. The Emperor's superstitious nature at once beheld in this a sign. He had the picture reproduced in gold, together with his own and his wife's initials, and presented a copy to each person present at Borki. His superstition has been further nourished by his almost miraculous escape. He regarded it as an indication that the Almighty visibly protects him, and since that day he no longer fears Nihilist attacks, and has abandoned almost all the precautions with which he used to surround himself. And the populace, yet more ignorant and superstitious, hold this view even more strongly, seeing in the escape at Borki yet another demonstration of the truth of their favourite saying, "God loves the Czar."

Russia, and especially ignorant peasant Russia, adores its Emperor. The Moujik figures to himself his Imperial master with head surrounded by a golden nimbus, clad in flowing gown, with three fingers raised in benediction and seated upon a throne of rubies, side by side with the Trinity. When they see the Czar and Czarina in flesh and blood it is often at first a shock to them. But all Russia does not consist of benighted Moujiks. This vast empire is also brim full of discontented subjects, who crave reforms and insist that they will have them. What Russia needs, however, is not a constitution, it is not ripe for that, but a different system of administration.

The Russians themselves do not know precisely what they do want, nor what they lack, but they are advancing and developing daily. The people begin to feel their power as an entity in the State, begin to comprehend that they have the right to be something else than a parcel of ignorant boors, who blindly obey and blindly worship.

From the day of Alexander III's accession all eyes turned hopefully to him. The late Emperor had made himself most unpopular, especially during the last year of his reign; it was hoped his son would inaugurate a new era. And certainly no Czars of late have taken so serious a view of their part, were filled with so great a sense of responsibility and moral obligation towards their God and their subjects, as the present Emperor. He knows that he was called to the throne by dynamite, that he lives and reigns under its constant shadow; but he does his duty unappalled, goes about his work unperturbed, though aware that it is but too probable that his father's fate may be his also, for his ideas run counter to modern aspirations and desires. He cannot, on that account, however, modify or alter them; he believes them to be the right and true ones, and his subjects must accept them so long as he holds the reins. The most kindly and unassuming of men in private life, in public matters his mind is that of an insufferable autocrat. There is also something quixotic in his character, which makes him think it dishonest to take long views and to calculate probabilities. Neither will he listen to the counsels of expediency. When any particular act seems to him clearly wrong, he will not do it, be it ever so convenient. He is level-headed, conscientious, healthy of mind and body. Had he more initiative, larger, broader views, and a little more confidence in himself—for this autocrat, strange to say, is the most diffident of men—he might prove a great ruler for Russia. But to be this many prejudices, personal and public, would have to be vanquished, many ancient traditions must be set aside, many things established centuries since overturned. Will Alexander have the courage, the will, the inspiration to carry out all that is asked, hoped of him? Will he find enlightened advisers able to aid him? That is the question. The desire to act for the good of the people is not wanting; but can such desires overcome natural shortcomings?

THE CROWN OF MONOMACHUS, USED IN ALL RUSSIAN CORONATIONS.

## CHILDREN AND THE POETS.

IS it true, as some modern writers tell us, that life in these busy and anxious days has lost much of its freshness, that we have less capacity for enjoyment than our fathers, and that the simple pleasures which they found the sweetest have no longer the power to charm? Is it true that as knowledge advances, and the world grows daily richer in variety of interest, the feelings become less sensitive, and the craving after excitement more intense?

Questions such as these are of course far more readily asked than answered. We cannot see enough of the age we are living in to estimate it rightly, and amid a multiplicity of voices the loudest is the most likely to attract attention. When dyspeptic magazine-philosophers doubt whether life is worth living, it does not follow that the vast bulk of Englishmen who are neither writers nor dyspeptic, have any uncertainty about the matter. There are jaded men, no doubt, who from moral or intellectual causes are joyless and unhopeful; but for most of us life, though often burdened with sorrow, is full of delight, and many there are, happily, to whom sorrow itself is the most faithful harbinger of joy. And how can life lose its brightness and men and women look upon it with weary eyes while it is still gladdened with the happy voices and sweet faces of children? They give a spirit of youth to everything, and their wistful joy and sense of wonder, their simplicity and trustfulness, their winning ways and innocent mirth, help to make their elders hopeful and happy too; for "of such is the Kingdom of Heaven."

The place children occupy in modern literature is, I think, a significant proof that if they are not loved more than in earlier days, there is in our time a far stronger expression of the interest they excite.

Poets and prose-writers unite in doing honour to the little ones and in trying to give them pleasure, but this was not the case to any large extent until the present century. Greek poetry and Greek art gained little, if any, inspiration from the sweetness and simplicity of childhood. Virgil, the most musical of Roman poets, and, as he has been well styled, the tenderest of poets, is unmoved by the charms of children; and long after Christianity had invested child-life with a new meaning and beauty the lesson was but slightly understood. The painter learnt it before the poet. Raphael taught the world, as Reynolds taught it long afterwards, the loveliness of infancy; but poetry had no song to utter on this theme; and even Shakespeare, whose largeness of nature comprehended every subject, with two or three beautiful exceptions, has little to say about children. Spenser, "our sage and serious poet," the sweetest and most musical of singers, leaves them almost wholly out of his song; and, although Milton writes quaintly "On the Death of a Fair Infant," and alludes more than once to children, there is no indication that he cared about them. It is otherwise, however, with his great contemporary, Jeremy Taylor, whose sympathy with childhood is seen in many allusions in his "Life of Christ," and in the following familiar passage: "No man can tell but he that loves his children how many delicious accents make a man's heart dance in the pretty conversation of those dear pledges; their childishness, their stammering, their little angers, their innocence, their imperfections, their necessities, are so many little emanations of joy and comfort to him that delights in their persons and society."

George Wither, a prolific poet of the period, who died in the same year as Taylor, and who has not yet received all the praise he merits, has written a charming cradle song; and, by way of alluring my readers to the poem, I will extract three stanzas:

"Sleep, baby, sleep! What ails my dear?
What ails my darling thus to cry?
Be still, my child, and lend thine ear
To hear me sing thy lullaby.
My pretty lamb, forbear to weep;
Be still, my dear; sweet baby, sleep.

"While thus thy lullaby I sing,
For thee great blessings ripening be;
Thine eldest brother is a King
And hath a kingdom bought for thee.
Sweet baby, then, forbear to weep;
Be still, my babe; sweet baby, sleep.

"When God with us was dwelling here,
In little babes He took delight;
Such innocents as thou, my dear,
Are ever precious in His sight.
Sweet baby, then, forbear to weep;
Be still, my babe; sweet baby, sleep.

Henry Vaughan, a sacred poet of rare gifts, who also belonged to the seventeenth century, writes of childhood as the "dear harmless age," and in his remarkable poem, beginning,

"Happy those early days when I
Shined in my angel infancy"

he suggested the thought, derived originally from Plato, which Wordsworth enlarged upon with such magnificence in his "Intimations of Immortality from Recollections of Early Childhood." "Men," said Dryden, "are but children of a larger growth;" and it is only of these full-grown children with beards on their chins that he condescends to write. The Queen Anne men, too, as a rule, regard the little ones with slight attention; but Prior has some charming lines "To a Child of Quality"; and Sir Richard Steele, who, with a thousand faults, was one of the most loving of fathers, pleasantly writes of his children's little ways, and has also a few exquisitely tender passages that owe their pathos to the recollections of childhood. One in particular describing a wife's sorrow over her dead husband, while her little child beats the coffin with his battledore, is hardly to be surpassed for tenderness.

Bachelors are not supposed to have much liking for babies and small folk; but Dr. Watts' "Cradle Hymn" is beautiful, and in life as well as verse. Oliver Goldsmith showed a graceful fancy for all young creatures. Dr. Johnson, large-hearted though he was, preferred reserving his affection until they were full grown. The record of a child's ignorant sorrow at the loss of a mother is touchingly described by Cowper in lines familiar to all readers, and Blake, a very child at heart, sings more than one child's song with a sweet but uncertain voice.

It was not, however, until this century opened that the claims and charms of children were recognised in literature, and, in spite of the good work done by Jane Taylor, Mrs. Barbauld, Miss Edgeworth, and others, it is only within the last twenty or thirty years that books for children, or about them, have filled a large and prominent place upon the shelves of libraries. Long before this, indeed, Wordsworth led the way, and the poet, who never seems to have played with children or to have delighted in their society, proved by his "We are Seven," and many another lovely poem, that he understood child-nature on its poetical side. Scott, who, like Southey, was one of the most loving of fathers, and entered into all the joys and sorrows of his children, cannot be said to excel as the poet of childhood, and I think that the Waverley Novels depend as little for their interest upon the representation of child-life as the plays of Shakespeare. The distinguished poets who were Scott's contemporaries found but small inspiration in this theme, but during the last half century our literature, and the literature of America, is abundantly rich in poems of this character.

A traveller, by the way, has said that there are no children in America; but, if so, who reads the charming books for children that come to us from the other side of the Atlantic? The grown-up people, perhaps; and I confess that some of these books, thanks to the art of writers like Mrs. Moulton, Mrs. Burnett, and many another author that might be mentioned, have given me fully as much pleasure as any American fiction written for adults. And one has only to mention the name of Longfellow, deservedly the most popular of American poets, to recall some of the sweetest lyrics, with children for their theme, known in these modern days. It is as if their poets, like our own, had been gifted with a vision of a garden of delights, the gates of which had been but partially opened to their predecessors.

Two interesting volumes lie before me which greatly strengthen this impression. The venerable poet Whittier's collection of poems, entitled "Child Life," consists, with but two or three exceptions, of poems written during this century, and almost wholly of lyrics belonging to the later portion of it. Indeed, so entirely modern is the character of this delightful book, that the appearance in it of such ancient classics as Cowper and Wordsworth seems almost out of place. Mr. Robertson's "Children of the Poets" is an anthology from English and American writers of three centuries, but eighty pages contain all the verse which the editor regards as suitable prior to Hartley Coleridge, the rest of the selection being taken either from recently deceased or from living poets.

If the period of child-poetry is limited, there can be no complaint that the supply of such verse is not sufficiently rich and varied. There is, I believe, no poet of mark writing within the last forty years who has left the children out of his song.

"Around the child bend all the three
Sweet graces—Faith, Hope, Charity,"

says Savage Landor, and may we not add that on the child are centred in these days the poet's three best gifts—imagination, fancy, and love?

It is very probable that childhood is not always so joyful a season as it seems in the retrospect,

for a child's little heart may be full to overflowing of some sorrow which his natural reserve prevents him from communicating. The fears of timid children may appear slight to their elders, but they are often vividly real, and need as much sympathy as our larger cares. Thomas Hood, in his "Retrospective Review," writes of his boyish days as if they were a constant source of enjoyment, and contrasts them, by the help of a string of puns, with his maturer years.

> "A hoop was an eternal round
> Of pleasure. In those days I found
> A top a joyous thing.
> But now those past delights I drop,
> My head, alas! is all my top,
> And careful thoughts the string!
>
> "No skies so blue or so serene
> As then; no leaves looked half so green
> As clothed the playground tree.
> All things I loved are altered so,
> Nor does it ease my heart to know
> That change resides in me!"

The feeling thus expressed may not bear severe scrutiny, but it is common to us all, and has been frequently uttered by the poets who look back to childhood as to a season of unclouded beauty. One peculiarity this season has, which is familiar to everyone, and has been beautifully noticed by Campbell—

> "The more we live more brief appear
> Our life's succeeding stages;
> A day to childhood seems a year,
> And years like passing ages.
>
> * * * *
>
> Heaven gives our years of fading strength
> Indemnifying fleetness;
> And those of youth a *seeming length*
> Proportioned to their sweetness."

And now, to begin at the beginning, let us see what some of the most modern of our poets have to say of the infant—"mewling and puking in the nurse's arms." Mr. Whittier opens his volume, not unwisely, with Mr. George Macdonald's well-known poem of questions to a baby and the baby's answers, which ends with the pretty couplet,

> "But how did you come to us, you dear?
> God thought about *you*, and so I am here."

Perhaps the most perfect picture of a baby we have from a poet's hand is given to us by Mrs. Browning in "Aurora Leigh":

> "There he lay upon his back
> The yearling creature, warm and moist with life
> To the bottom of his dimples, to the ends
> Of the lovely tumbled curls about his face;
> For since he had been covered over-much,
> To keep him from the light-glare, both his cheeks
> Were hot and scarlet as the first live rose
> The shepherd's heart-blood ebbed away into
> The faster for his love. And love was here
> As instant! in the pretty baby-mouth,
> Shut close as if for dreaming that it sucked;
> The little naked feet, drawn up the way
> Of nestled birdlings; everything so soft
> And tender,—to the little holdfast hands,
> Which, closing on a finger into sleep,
> Had kept the mould of it—
> While we stood there dumb—
>
> * * * * *
>
> "The light upon his eyelids pricked them wide,
> And staring out at us with all their blue,
> As, half perplexed between the angelhood
> He had been away to visit in his sleep,
> And our most mortal presence,—gradually
> He saw his mother's face, accepting it
> In change for heaven itself, with such a smile
> As might have well been learnt there,—never moved,
> But smiled on in a drowse of ecstasy,
> So happy (half with her and half with heaven)
> He could not bear the trouble to be stirred,
> But smiled and lay there."

Lord Tennyson has caught the style of baby verse in his musical lines, "Little Birdie," and still more in the lovely song,

> "Sweet and low, sweet and low,
> Wind of the western sea,"

which many a young mother whose husband is on shipboard may have sung over her infant's cradle; and these stanzas, too well-known, perhaps, to be quoted, remind one that babyhood and infancy have given to the song of Victor Hugo, the greatest of modern French poets, its purest inspiration, and that his disciple Mr. Swinburne, after straying many a time into less healthful ways, has found refreshment from the clear atmosphere in which little children breathe. From "A Century of Roundels" I will take one called "Babyhood."

> "A baby shines as bright
> If winter or if May be
> On eyes that keep in sight
> A baby.
>
> "Though dark the skies or grey be,
> It fills our eyes with light,
> If midnight or midday be.
>
> "Love hails it day and night,
> The sweetest thing that may be
> Yet cannot praise aright
> A baby."

There are many such baby verses in the volume from which this is taken. Am I wrong in believing that they will impress the reader more as subtle exercises in a foreign form of verse than as the fruit of poetical emotion? Enough of babies, perhaps, and yet I do not like to pass by the capital lyric of "Willie Winkie," who runs through the town at night, "tapping at the window, crying at the lock," to ask if the weans are in bed; and

a mother who hears him, calls out that her baby boy will not go to sleep:

"Anything but sleep, you rogue!
Glowering like the moon;
Rattling in an iron jug
With an iron spoon;
Rumbling, tumbling all about,
Crowing like a cock,
Screaming like I don't know what,
Waking sleeping folk.

"Hey! Willie Winkie,
Can't you keep him still?
Wriggling off a body's knee
Like a very eel;
Pulling at the cat's ear
As she drowsy hums;
Heigh! Willie Winkie!
See! there he comes!"

I will not quote again from Mrs. Browning, but it would not be doing justice to this department of her art to pass by without mention such lovely poems as "Isobel's Child," "The Romance of the Swan's Nest," "The Deserted Garden," "Hector in the Garden," "A Child's Grave at Florence," and that passionate utterance of a woman's heart, "The Cry of the Children," in which the fire of her genius burns perhaps at its brightest. Truly Mrs. Browning is the poet-laureate of children. Lord Tennyson, too, when he touches on this theme does so with the inimitable charm, not readily to be described, but always to be felt, which for more than half a century has made his song so dear to us.

"The May Queen" belongs to his earliest poems, "In the Children's Hospital" to the latest. This poem of his old age has a pathos and tenderness which show how in all great poets the softer qualities of the woman's nature are linked to that of the man. A few lines only shall be quoted. A sceptical surgeon having muttered to himself, in reply to the Christian nurse who tells the story, "The good Lord Jesus has had His day," she continues:

"Had! has it come? It has only dawned. It will come by-and-by;
O, how could I serve in the wards, if the hope of the world were a lie?
How could I bear with the sights and the loathsome smells of disease,
But that He said: 'Ye do it to Me when ye do it to these'?"

And then she goes on to tell how her little patient overheard the doctor say that he must operate to-morrow, but feared the child would never live through it. So poor little Emmie takes counsel of Annie, who lies in the next bed, and asks what she shall do; and she advises her to cry to the "dear Lord Jesus" to help her.

"'Yes, and I will,' said Emmie; 'but then, if I call to the Lord,
How should He know that it's me? such a lot of beds in the ward!'
That was a puzzle for Annie. Again she considered, and said,
'Emmie, you put out your arms, and you leave 'em outside on the bed—
The Lord has so *much* to see to! but, Emmie, you tell it Him plain,
It's the little girl with her arms lying out on the counterpane.'"

The doctor came in the morning, and the nurse went with him to the bedside.

"He had brought his ghastly tools; we believed her asleep again—
The dear, long, lean, little arms lying out on the counterpane;
Say that His day is done! Ah, why should we care what they say?
The Lord of the children had heard her, and Emmie had past away."[1]

Mr. Coventry Patmore, one of the most popular poets of our day, whose finest work is perhaps the least appreciated, has written a short poem called "The Toys," so remarkable for its thoughtful pathos and depth of feeling that nothing but the fear of overstepping the allotted space prevents me from quoting it. A poem, however, that has found or will assuredly find its way into all selections can be passed over without loss to the reader.

The poems called forth by children, and the merry verses written for their delight, are far from being confined to great singers. The versifiers have been as successful as the poets. Of these some of the happiest are Mary Howitt, Mr. Stevenson, Mrs. Piatt, the author of "Lilliput-Levee," and the authors of "Poems written for a Child," one of whom is Miss Smedley, whose rhymes descriptive of "A Boy's Aspirations" give us a bit of boy-nature that most of us will recognise; but the "Aspirations" belong, I think, to a child of six or seven, rather than of four. Out of ten stanzas three shall be quoted:

"I was four yesterday; when I'm quite old,
I'll have a cricket-ball made of pure gold;
I'll carve the roast meat, and help soup and fish;
I'll get my feet wet whenever I wish.

"I'll go at liberty upstairs or down;
I'll pin a dishcloth to the cook's gown;
I'll light the candles and ring the big bell;
I'll smoke Papa's pipe, feeling quite well.

"I'll have a language with not a word spell'd;
I'll ride on horseback without being held;
I'll hear Mamma say, 'My boy, good as gold!'
When I'm a grown-up man sixty years old."

Mr. Stevenson, one of the latest writers of children's songs, is also one of the best. "The Land of Counterpane," and "My Bed is a Boat," are both admirable. I will quote the latter:

[1] This is the nurse's answer to the remark of the sceptical surgeon; but instead of *His* day, the "Children of the Poets" has the misprint of *this* day, which makes the most significant line in the poem meaning less.

"My bed is like a little boat;
Nurse helps me in when I embark;
She girds me in my sailor's coat,
And starts me in the dark.

"At night, I go on board and say
Good-night to all my friends on shore;
I shut my eyes and sail away,
And see and hear no more.

"And sometimes things to bed I take,
As prudent sailors have to do;
Perhaps a slice of wedding-cake,
Perhaps a toy or two.

"All night across the dark we steer;
But when the day returns at last,
Safe in my room, beside the pier,
I find my vessel fast."

This is just the kind of fancy which an imaginative child loves to indulge in, and the commonest objects will supply all that such a child needs to people his room with imaginary beings, and to make them act their little parts. Mr. Stevenson understands children, and the verses children like; and so does the author of "Lilliput Levee," as a delightful little poem, "The Child's World," proves:

"Great, wide, beautiful, wonderful World,
With the wonderful water around you curled,
And the wonderful grass upon your breast—
World, you are beautifully drest.

"The wonderful air is over me,
And the wonderful wind is shaking the tree,
It walks on the water and whirls the mills,
And talks to itself on the tops of the hills.

"You, friendly Earth, how far do you go
With the wheatfields that bend and the rivers that flow,
With cities and gardens, and cliffs and isles,
And people upon you for thousands of miles?

"Ah, you are so great, and I am so small,
I tremble to think of you, World, at all;
And yet, when I said my prayers to-day,
A whisper inside me seemed to say,
'You are more than the Earth, though you are such a dot:
You can love and think, and the Earth cannot!'

If we pass from the days of infancy and childhood to the happy years that lie between twelve and eighteen, the wealth of poetry suitable for youthful readers is well-nigh unlimited. Nearly all the great poets of the country have contributed to their delight, but they will prefer, I think, in the earlier period the poetry of action of which Sir Walter Scott is one of the strongest modern representatives. A schoolboy likes vigour better than sentiment, and prefers a poem full of eager movement to one that is reflective or descriptive. The rhythm of a lovely lyric like Tennyson's "Break, break," or of Gray's incomparable "Elegy," may attract him, but Drayton's "Agincourt," Campbell's "Hohenlinden," Mr. Browning's "Ride from Ghent to Aix," or Scott's splendid battle-pieces will create more enthusiasm. There are boys and girls who display in their school days a love of poetry which makes Spenser and Milton and Wordsworth as dear to them as Bishop Percy's ballads were to Scott at the age of thirteen; but these are exceptionally gifted, and it would be unreasonable to expect that the finest qualities of verse can be generally discerned by young readers. I well remember in my "salad days, when I was green in judgment," thinking that "Lalla Rookh" was superior to "Paradise Lost," and a false estimate of this kind matters little so long as an enthusiasm for poetry is awakened in youth. Lord Tennyson, who in his old age has equalled the finest work of his early days—for at no period has he written anything finer than "Rizpah"—has done much to make poetry dear to two generations of readers in their teens; and so, in a lesser degree, has Longfellow, a charming but far inferior poet. It is difficult to estimate the noble service rendered by these distinguished men, who, if they are dear to the young, are none the less beloved by readers and critics who have long ago renounced any claim to be called youthful. And, indeed, all noble verse that suits readers in their teens should be an equal joy to their parents. I have been examining with much interest the three school poetry-books compiled by Miss Woods, and have been struck by the fact that these volumes, intended for girls of the lower, middle, and upper forms of high schools, are every whit as well fitted for readers of mature knowledge and of advanced age. It cannot, indeed, be otherwise, for they contain many of the loveliest poems in the language.

When once a young reader has advanced beyond the stage of nursery rhymes he is on a level with his elders, and, like them, can wander at will in the enchanting land of poetry. Only by slow degrees will its full beauty dawn upon him, but a sufficient sense of that beauty may be gained early, and the delight will grow with the growth of knowledge. The anthologies that lead young readers along this pleasant road, where the greenery and blossoms of summer last all the year round, are among the most useful of volumes. They stimulate a taste for what is most noteworthy in literature, and point to "fresh woods and pastures new" at the very season when guidance is most needed.

JOHN DENNIS.

# LORD JOHN RUSSELL.

THE appearance of "The Life of Lord John Russell" recalls a name that will always hold a conspicuous place in the history of England.[1] That he was not only a great political leader, but a statesman of the first rank, is known to all. What were the special features of his character, and what the reasons of his being so famous, is not so well known to the present generation. He seems to belong to a bygone age, for there are comparatively few whose personal memory goes back to the time when he was one of the foremost men in England, and when the great measures were carried with which his name will be associated in history. It is now more than eleven years since his death, and nearly a quarter of a century since his official career terminated. Many events of world-wide interest have occurred since that time; other men and other measures have occupied public attention; new political parties have been formed; and it is therefore not surprising that the memory of the great Whig leader should have begun to fade. It was high time that his biography should be written, and the great services rendered by him to the nation should have an enduring and worthy record.

This task could not have fallen into fitter hands than the author of "The Life of Lord John Russell," who has wisely made this the title of his book, as a name more generally known than his later designation of Earl Russell, and as associated with the national events which made him famous in English history. "*Quorum pars magna fui*," he might, above all men, have said concerning these events. Mr. Spencer Walpole, as the author of "A History of England from 1815," is well versed in the political annals of the period covered by Lord John Russell's career. No biographer has ever had more abundant and more varied materials for the task undertaken by him. Apart from the public and official documents available, the author has had access to the manuscript letters, journals, and private papers in the possession of Lady Russell. The Queen has given permission to use the letters addressed to her and other letters in the royal archives. The representatives of Lord Aberdeen, Lord Clarendon, Lord Lansdowne, the Duke of Wellington, and most of the public men of the time have placed their correspondence with Lord John Russell at the author's disposal, so that, along with the Russell records from Woburn, and the letters and manuscripts from numerous official colleagues or personal friends, Mr. Walpole must have been almost embarrassed by the abundance of his materials. That he has managed to confine his work to two octavo volumes is to be regarded as a proof of great judgment as well as literary skill.

When he began his work an illustrious member of the Russell family spoke of the magnitude of the undertaking, for a "Life of Lord John Russell" must be a history of England and of the Whig party during half a century. "Anyone," says Mr. Walpole, "who shares this opinion will meet with nothing but disappointment in these pages. From the beginning to the end of my book I have endeavoured to recollect that I was not writing a history of England or of the Whig party, but a life of Lord John Russell; and I have been much more anxious to draw a portrait of the man than to write an account of the time." He has succeeded in doing both, and in so masterly a way that the reader has a lifelike portraiture of the man, and at the same time obtains a clear and most instructive summary of the events of the half century when he took part in public affairs.

Lord John Russell, born in Hertford Street, Mayfair, in 1792, was the third son of the Lord John who became in 1802 the sixth Duke of Bedford. The fifth Duke died that year, unmarried. The fourth Duke, who from the fall of Walpole to the rise of Rockingham took a leading part in politics, is familiar in history, and in the letters of Junius. Of older distinction is the Russell who drained the Bedford Level, and those Earls of Bedford who, in the reigns of the Stuarts, got grants of vast areas in the metropolis, the sites of which are marked by the squares and streets bearing the family names of Russell, Tavistock, Bedford, and many more, including Covent (or Convent) Garden and Southampton Street, the last named after Lady William Russell, daughter of the Earl of Southampton. "Strange," says old Malcolm, the topographer, "that a fifth of London should have been erected by this family within two centuries!"

Of higher distinction than all these was Lord William Russell, the patriot-martyr. The Lord John Russell of our time was the scion of a great and wealthy house, and has thrown fresh lustre on the historic name beyond all, except that one Russell to whom Moore referred when he wrote his "Remonstrance" to his young friend on expressing his purpose to abandon political life.

> "What! *thou*, with thy genius, thy youth, and thy name!
> Thou, born of a Russell, whose instinct to run
> The accustomed career of thy sires is the same
> As the eaglet's to soar with his eyes to the sun;
> Whose nobility comes to thee, stamped with a seal
> Far, far more ennobling than monarch e'er set;
> With the blood of thy race offered up for the weal
> Of a nation that swears by that martyrdom yet!
> Shalt *thou* be faint-hearted, and turn from the strife,
> From the mighty arena, where all that is grand,
> And devoted, and pure, and adorning in life,
> Is for high-thoughted spirits like thine to command?"

Happily, Lord John did not abandon politics for literature, as was his intention when Moore

[1] "The Life of Lord John Russell." By Spencer Walpole. London: Longmans, Green, and Co.

penned his poetic remonstrance. In more peaceful and auspicious times he was the chief agent in gaining for the English nation the blessings of civil and religious freedom, which his patriotic ancestor died on the scaffold to obtain.

Of the education and of the early training of Lord John a most interesting account is given by his biographer. It was a preparation for public life strange and almost unique. His earliest years he spent at home with his mother, whose favourite child he was, probably because from her he inherited the delicate health with which she was afflicted at and after his birth. In his old age he recalled these child years in a memorandum dictated by him to Lady Russell, in 1871. "I was very fond of my mother. I used to call her in the morning, and from that hour during the whole day she showed me the utmost affection. I used to delight in reading to her 'Plutarch's Lives' in the morning. In the middle of the day I worked at a little garden, following the directions which my father gave me in a little almanack, partly in print, and partly written by him for me. The place where I passed my early childhood was Stratton Park, in Hampshire (now the property of Lord Northbrook), where Lord and Lady Russell passed many happy years. When I was about eight years old Stratton was sold to my uncle, the Duke of Bedford, and Oakley, in Bedfordshire, was lent to my father instead; I never liked Oakley so well."

He did not stay long at Oakley, being sent to a private school at Sunbury, with his brother William. His mother died when he was at this school, in 1801, and his uncle soon after. His father was now Duke of Bedford, and the boys went home in the holidays to Woburn, or London, instead of to Oakley. In the second year after his first wife's death the Duke married a daughter of the Duke of Gordon, who proved an affectionate and careful stepmother to the children. He had great liberty, and his journals record his youthful enjoyment of shooting, hunting, and other rural sports. In September, 1803, the boys were sent to Westminster School, of the lessons and discipline of which, at that time, there is an amusing account given in his diaries and letters. Fagging was in full force then, and John was rather severely treated by his brother William, whose fag he was. In after years Lord William comforted himself with the reflection that Johnny would have fared far worse if a strange boy had been over him. It was because of his complaints about the "hard life of a fag," and the unwholesome food, that his stepmother insisted on his leaving Westminster, and being sent to a private tutor at Woburn Abbey, Dr. Cartwright, chaplain of the Duke, and brother of Major Cartwright, the famous radical reformer. His tutor took great interest in the boy, and gave him love not only for learning but for mechanical arts. The name of Dr. Cartwright is forgotten now, but it was by one of his inventions, the power loom, that handloom weaving was superseded and a complete revolution in manufacturing England begun. He also encouraged his pupil to write poems, including his first dramatic composition. The kind of education he got at Westminster may be imagined from the anecdote told of the Duke giving his son a short account to sum up, and being astonished by the boy's inquiry what those curious signs ½ and ¼ (halfpenny and farthing) meant!

In 1805 he was sent to board with the Rev. Mr. Smith, vicar of Woodnesboro', near Sandwich, where he had as fellow-pupils the Duke of Devonshire, then Lord Hartington, the Duke of Leinster, Lord William Fitzgerald, and other boys of good families. The vicar, "Dean Smigo," as the boys called him, was a very worthy man, with a motherly wife and a number of pretty and lively daughters. The pupils had a pleasant time at Dean Smigo's, and were not too hard worked, as there were many holidays, including the birthdays of the master's many children. But Lord John was there only for a few months, from February till August, 1805, after which he spent six months at Woburn and in visiting at several country houses.

The schoolboy diaries of those years are very amusing, the most trifling details being given in some extracts, but occasionally there are glimpses of deeper thought, as when he had been on a visit to Mr. Fox, who spoke with levity about charges brought against Lord Melville as Lord of the Admiralty. On this Lord John wrote in his diary, "What a pity that he who steals a penny loaf should be hung, whilst he who steals thousands of the public money should be acquitted." Lord Melville was acquitted of the main charges, but the comment by this boy of fourteen was characteristic.

The last entry in that year, on his birthday, August 18th, records that "he played at cricket, and was 4 feet 9½ inches high, and 5 st. 3 lb. weight, 3¾ inches taller than last birthday," so "little Johnny" was beginning to outgrow his dwarfishness and feebleness. The extracts given from the diary in the following years show how rapid also was his growth in knowledge and intellect, freely criticising and giving his opinion on men and things as well as on books which he read. He also canvasses the merits of actors, being fond of dramatic amusements, and with abundant opportunity of gratifying his taste, both in London and Dublin, when his father was Irish Viceroy under the Whig Ministry, after the death of Pitt. He had also, before this, begun to take deep interest in political questions, and discusses them in his correspondence with great volubility and freedom.

In the holiday months of 1807 he had an extensive tour in Scotland along with the Duke and Duchess of Bedford. The places visited are familiar to every tourist in our day, but were within the reach of comparatively few at that time, when we consider the cost of travelling eighty years ago. From Ayrton, in Berwickshire, Lord John returned alone to Woodnesboro', and he paid for his place in the mail from Ayrton to London, £8 19*s.* 6*d.*; from London to Canterbury, £1 14*s.* 6*d.*; for a chaise to Woodnesboro', 15*s.*; guards, coachmen, and postboys, £3 13*s.* 8*d.*

Without reckoning the cost of food in a journey of three days and three nights, Lord John spent in mere travelling above £15 for a journey which a first-class passenger can now accomplish at little more than a quarter of the cost and in a third of the time.

When Lord and Lady Holland were at Woburn in July, 1808, they suggested to the Duke of Bedford that Lord John should accompany them on a tour they were projecting to the scene of the Peninsular War. To visit Spain was a delightful prospect for young Russell, not only as a land of historical romance, but on account of the stirring events of which it was then the theatre. In 1806 he had entered in his Diary, "How long Bonaparte will domineer over the world, and how long we can make head against him, God only knows, but the rapidity of his conquests is unexampled." The victories of Austerlitz and Jena had placed Central Europe at the feet of the Emperor, and the Treaty of Tilsit had made Russia his ally. England alone maintained the struggle with France. In the Spanish Peninsula the conflict had commenced. Lord Holland's party were at Corunna during the alarm caused by the retreat of Sir John Moore and the advance of the French, and they soon returned home. Lord John saw little of Spain on this first visit, but he went again when Sir Arthur Wellesley was the Commander of the British Army, and was with him in his frontier camp before he began his triumphant advance from Portugal.

Between the two Spanish tours the education of Lord John Russell was continued by his being sent to study at the University of Edinburgh. Here he stayed during the terms of three years, having the advantage of being a private pupil and of living in the house of Professor Playfair. At that time there were not a few young Englishmen who were sent to Scotland instead of to an English university. Lord Henry Petty, afterwards Lord Lansdowne, was living with Playfair's equally illustrious colleague Dugald Stewart, and a large number of young men, both Scotch and English, who in after years rose to distinction, then attended the college classes, and took part in the university debating societies. There could not be a better place for the development of young Russell's intellectual powers, as well as his political enthusiasm. He did not leave Edinburgh till 1812. He was an earnest and diligent student during the college sessions, and in the long vacations he was always moving about either in our own island or on the Continent. In the spring of 1815, after seeing Rome and Naples, he made the usual "grand tour," but with the singular episode of a visit to Napoleon, then in exile at Elba. He was with the Emperor for an hour and a half, in busy conversation all the time. Of Napoleon's personal appearance, and the impression made by this interview, he thus wrote in his journal:

"He has a dusky grey eye, which would be called vicious in a horse, and the shape of his mouth expresses contempt and decision. His manner is very good-natured, and seems studied to put one at one's ease by its familiarity; his smile and laugh are very agreeable; he asks a number of questions without object, and often repeats them, a habit which he has no doubt acquired during fifteen years of supreme command. To this I should also attribute the ignorance he seems to show at times of the most common facts. When he does not like what he hears, he turns away as if unconcerned and changes the subject. From this one might conclude that he was open to flattery and violent in his temper."

We must linger no longer on the opening of that career on which he was soon about to enter. His education, in the ordinary use of the term, had been irregular, and as to book-learning, not deep, but well calculated to develop his mind for active life. It is thus summed up by his biographer:

"If he had not much pretension to exact knowledge, his reading was wider than that of most of his contemporaries; and he had not merely a large acquaintance with authors of many nations, he had thought on what he read. His mind, too, had been enlarged by intercourse with superior men, and by the opportunities of foreign travel. Few men of his age, standing on the threshold of a career, had seen so much that was worth seeing. He had knowledge of every division of the United Kingdom. In London he had breakfasted with Mr. Fox, he was a frequent guest at Lord Holland's dinner-table, he was acquainted with all the prominent leaders of the Whig party, he had already become a member of Grillion's Club. In Dublin he had seen all that was best in society; in Edinburgh he had mixed with all that was best in letters. He had already made the acquaintance of Mr. Moore in one capital; he was on terms of intimacy with Mr. Jeffrey in the other. He had dined with Mr. Parr at Birmingham, with Bishop Watson on Windermere; he had walked with Sir Walter Scott along the banks of the Tweed, and he had passed a night in the poet's home at Ashestiel. He had travelled through the Highlands of Scotland, and had carefully examined the great manufacturing industries of England. Abroad his opportunities had been even greater. He had read his Camoens in Portugal, his Tasso in Italy; he had traversed the Italian Peninsula from Naples to Venice, he had journeyed through the length of Spain, he had ridden with the Duke of Wellington along the lines of Torres Vedras; he had watched a French advance in force in the neighbourhood of Burgos, he had gazed from a British position near La Rune over Southern France. He had conversed with Napoleon in Elba, and he had hurried home to denounce in his place in the House of Commons the inception of a new war. Was there another man in England, who had not completed the twenty-third year of his age, who had seen so much and who had done so much as Lord John Russell? His desultory education had been appropriately ended by his leaving Edinburgh without taking a degree. But the deficiency had been amply repaired. He had graduated in the University of the world."

Russell began his public life when still under age. He was returned to the House of Commons for the family borough of Tavistock. For several years he was almost a silent member, and seemed to take no great interest in the proceedings of Parliament. He continued to enjoy foreign travel, and was absorbed in literary pursuits; but he was watching the course of events, and was being firmly established in liberal principles, and preparing for his career as a reformer. In 1819 he moved a resolution for the disfranchisement of the defunct borough of Grampound, and for preventing corruption at elections. Three years later he moved four famous resolutions affirming the expediency of giving direct representation to great and populous places—such as Birmingham, Leeds, and Manchester. He carried with him 154 members of the unreformed Parliament. Not only the old Tory "boroughmongers," but Canning, Peel, and those afterwards called

"Conservatives," were against him. Canning said, however, in a celebrated speech, that if ever the reform of Parliament was carried, the triumph would be chiefly due to the efforts of Lord John Russell.

We have not space, nor would the neutrality of a literary journal allow of detailed notice of the many Parliamentary struggles in which Lord John was the leading spirit, and of the progress of his career as a reformer. Mr. Walpole gives a masterly sketch of the social and political condition of England when he entered public life, and of the condition of the nation when he retired from the House of Commons, and he shows how, from the darkest and least hopeful times, in the reign of George IV and of William IV, through the early periods of Queen Victoria's reign, Lord John Russell was the recognised leader of the Whig party, and the prime mover in every reform. Whoever might be at the head of the Government, and whether in power or in opposition, Lord John led the party of progress in the House of Commons. With his name, above all others, we associate the passing of the great Reform Bill, of Municipal Reform, the repeal of the Test and Corporation Acts, the admission of Roman Catholics, Jews, and other Nonconformists to every social and political right as citizens, and many other measures of "civil and religious liberty." The names of contemporary statesmen are associated with the passing of some of these measures—as that of Catholic emancipation, carried by the Duke of Wellington as the only way of avoiding civil war, the repeal of the Corn Laws, when Sir Robert Peel abandoned the cause of Protection, and the fiscal reforms which Mr. Gladstone carried to triumphant issue. But in these movements of progress little could have been done but for the long and consistent efforts of Lord John Russell. On the questions of slave emancipation, the education of the people, tenant right in Ireland, improved relations with the Colonies, and many more, his labours prepared the way for the success which others have got the credit for achieving. It is not merely for the measures which became law when he was twice Prime Minister, but for the steady, continuous movements of progress throughout his long period of official life, that his services to the country are to be remembered with thankfulness.

Administrative ability unfortunately attracts less attention than Parliamentary eloquence; and the capacity which a man displays in his office is forgotten when the generation who work under him passes away. It would otherwise be remembered to Lord John's credit that no man in the present century has acquired greater reputation as a minister. He was one of the best Secretaries of State that ever entered the Home Office; and in his short career at the Colonial Office he displayed a breadth of view and a sobriety of judgment which promised to make him the greatest of Colonial Ministers. His great speech on Colonial policy, in 1850, which is in reality an elaborate treatise on the rise, progress, and future of the Colonies, is an eternal proof of the thoroughness with which he had thought out every portion of the subject; while the continuous efforts which he made at the Home Office for the more rational treatment of crime by the construction of better prisons, by the introduction of improved prison discipline, by the gradual abolition of transportation, and by the establishment of a rural police, again afford a decisive proof that his desire was not only to administer, but to improve, what he found. Perhaps modern England owes as much to the improvements he thus introduced as to the passage of the Reform Act.

With regard to his position after the passing of the great Reform Bill, injustice has sometimes been done to his memory. He has been represented as opposed to further extension of political power to the people, and he was even called "Finality John." He never himself used the word "finality," it was a nickname given by less judicious reformers. He did use the words "Rest and be thankful" in a speech which gave wise and statesmanlike caution against too rapid and unguarded advance towards democracy. But he remained a true reformer to the end; and he was never tempted, as other political leaders were, to gain power and place by outbidding his rivals. He had a dread of mob-rule, and giving to mere numbers the influence due to other qualifications. He sought reform, not revolution; and the progress he advocated was always on the lines and within the limits of the Constitution.

It is to his praise, and not to his reproach, that it could be said of him "at eighty he retained the opinions and displayed the spirit on which he acted at forty years of age." The verdict of history has been anticipated by those best qualified to judge. When Mr. Gladstone was called for the first time to form a Ministry, he sought the aid of Lord John, offering him any post which would least disturb his desire for repose after long public service. "My political relations with you," he wrote, "began late in life. I moved to you, not you to me; and ever since we have been in contact—that is to say, during the last fifteen years—my co-operation with you has been associated all along with feelings of warm attachment and regard." This was written in 1867; and Mr. Gladstone adds: "Your fame is not a question of to-day's or to-morrow's popularity, but of the future at large. If you do not stand without a rival, I, for one, undoubtedly do not know where to look for your superior in the annals of British legislation. None of those we see, perhaps none of those we remember, will take so high a place. So long as you have been ready to lead, I have been ready and glad to follow."

Although Lord John did not accept the position offered in so generous a spirit, the mutual regard and affection was increased in after years; and we were told by the late Mr. Winterbotham, M.P., of the Home Office, that one day, in conversation, Mr. Gladstone said that, of all the names that would appear in the political history of England during the nineteenth century, that of Lord John Russell would shine with the brightest lustre.

Mr. Walpole refers to Lord John's fame as likely to rest rather on administrative ability than on parliamentary eloquence; but there were not a few occasions on which he rose to the highest strains of oratory. Of this it was that Lord Lytton spoke in the famous lines in the "New Timon," where he sketches the characteristics of the leading men of the House of Commons. After describing his usually calm and cool demeanour,

" But see our statesman when the steam is on,
And languid Johnny glows to glorious John ;
When Hampden's thought by Falkland's muses dressed,
Lights the pale cheek, and swells the generous breast ;
When the pent heart expands the quickening soul,
And, foremost in the van, the wheels of genius roll."

It was in debate that Russell had no superior, although others might excel in rhetorical display. Sir Robert Peel said to Lord Coleridge, speaking of his quickness and dexterity in reply, "Though bludgeons were not in Lord John's way, he can draw a rapier of the finest temper and polish, and run you through." Of this sharpness was the retort to Sir Francis Burdett, "The honourable member talks of the cant of patriotism; but there is something worse than the cant of patriotism, and that is the recant of patriotism." But it is more pleasant to speak of the nobler strains of eloquence, of which one of the finest examples was the peroration of the speech which carried the voice of the House for persevering in the efforts to suppress the African slave trade.

"I will not despond. I believe despondency itself to be a main cause of failure. Nothing but our being faint-hearted on this subject, and saying that we are unable to cope with the great evils to be met, will finally give a permanent sway and supremacy to the slave trade. There are, Sir, other considerations and other motives which influence the House in coming to a decision on this question. Sir, we have been blessed with great mercies during the past year. We have more than once had to thank Almighty God for the dispensation of His goodness. It appears, then, to me that if we were now to say that the trade in man—that this unhallowed and cruel traffic, against which England for nearly fifty years has been working by the efforts of her greatest statesmen and her best and bravest sailors—that if we were to decide to allow this trade to be pursued freely and unhampered—we should no longer have a right to expect a continuance of the signal blessings that we have enjoyed. I think, Sir, that the high, the moral, and the Christian character of this nation is the main source and secret of its strength; and that, if we give up this high and holy work, and proclaim ourselves no longer fitted to lead in the championship against the curse and the crime of slavery, we have no longer a right to expect the continuance of those blessings which, by God's favour, we have so long enjoyed."

Palmerston was delighted with this speech, and next morning he wrote a note of warmest congratulation—"Your course has been worthy the Minister of a great country, and the House of Commons has maintained its character as the organ of a noble people."

In some of his speeches and acts as Minister of Foreign Affairs, Palmerston himself did not display more generous and patriotic spirit than Lord John. They were rivals at one time, and opposed to each other on some points, but in the main they were animated by the same English and Christian spirit. Their friendship survived any temporary differences, and it was a touching proof of this that Lady Palmerston asked Lord John to unveil the memorial statue of Lord Palmerston, as being "his oldest and best friend."

In connection with the Foreign Office there is an amusing reference to the irrepressible and ubiquitous newspaper reporter, who sometimes caused mischief even before the days of "interviewing." Lord Palmerston consented to receive some deputation at the Foreign Office at the time when there was much sensitiveness on the part of the Austrian and Russian Governments as to the reception of rebel refugees. He did not take the precaution to see the "addresses" before they were delivered, and the Emperors of Austria and Russia were spoken of as "odious and detestable assassins." A report of the interview got into the newspapers, with these words, naturally offensive to the ambassadors of allied powers. The Queen also had expressed to Lord John Russell her annoyance at the effusive reception given to Kossuth by Lord Palmerston. Palmerston wrote an explanation to the effect that he ought to have seen the addresses, and also to have stipulated that no reporter should be present. "It seems," he continues, "that a trading penny-a-liner came as a member of the deputation, and as the price of his commodity would depend upon the number of lines it contained, he swelled it out into proportions incommensurate with the reality, and put words into my mouth about the nationality of countries which were nonsense."

Lord John forwarded this letter of explanation to the Queen, but he had himself already had a sharp passage of the pen with Lord Palmerston on a similar subject. He sent a letter to the Foreign Secretary, suggesting the impropriety of receiving Kossuth at an assembly to which he was invited. The bearer of the letter was to bring back a reply, which came pretty sharp both in time and tone.

"Panshanger, October 30, 1851, 6.0 p.m.

"My dear John Russell,—I have just received your letter of to-day, and am told your messenger waits for an answer. My reply then, is immediate, and is, that there are limits to all things; that I do not choose to be dictated to as to who I may or may not receive in my own house; and that I shall use my own discretion on this matter. You will, of course, use yours as to the composition of your Government. I have not detained your messenger five minutes. Yours sincerely,

"PALMERSTON."

On this occasion an open breach was avoided, but soon afterwards Lord Palmerston thought proper to express personally to the French Minister, in London, his approval of Louis Napoleon's *coup d'état*, of the 2nd December and succeeding days. The correspondence which passed, and the Queen's severe and dignified memorandum, will be found in the "Life of Palmerston," and in Sir Theodore Martin's "Life of the Prince Consort." There was never again any possibility of cordial co-operation between the two great statesmen, but Lord John's kindly feeling towards his old friend and colleague was renewed in after years.

Of the connection of Lord John with the Aberdeen Cabinet, under which the nation drifted into the war with Russia, it is not our purpose to speak. It has been truly said that this connection brought little profit or reputation to any of the persons concerned, and Russell himself needed all the pressure that a sense of duty and the representations of the Queen could bring to bear, to induce him to enter the Cabinet, and to remain in it. One of the Royal letters, printed by Mr. Walpole,

shows the high estimate in which both Russell and Palmerston were held. It was written immediately after the death of Palmerston.

"The melancholy news of Lord Palmerston's death reached the Queen last night. This is another link with the past that is broken, and the Queen feels deeply in her desolate and isolated condition how one by one of those tried servants and advisers are taken from her. . . .

"The Queen can turn to no other than Lord Russell, an old and tried friend of hers, to undertake the arduous duties of Prime Minister, and to carry on the Government."

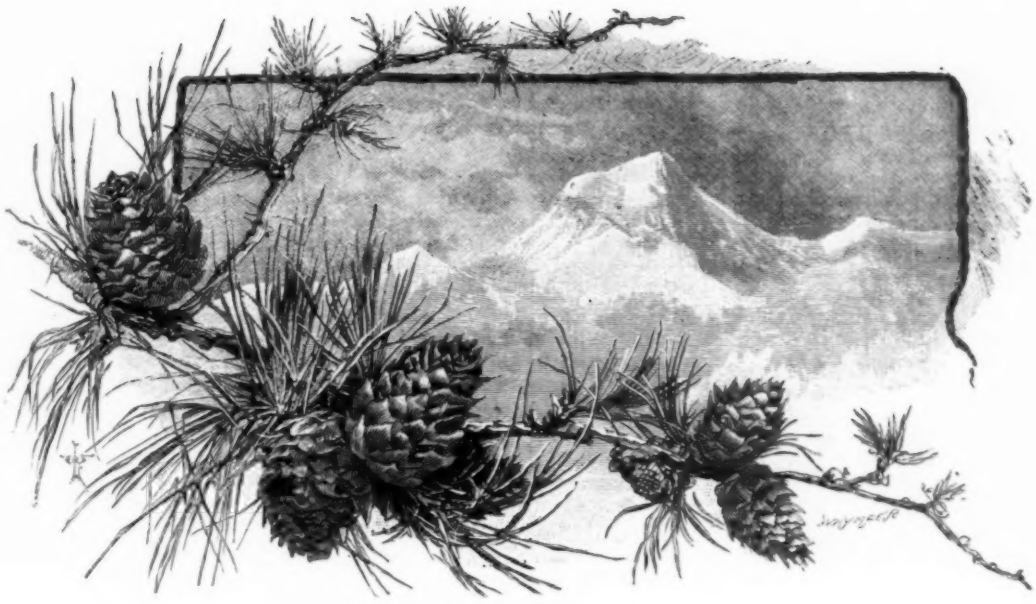
This letter shows how deep and enduring was the regard in which the Queen held Lord John, to which she had given expression many years before, when he had reported to her Majesty the result of the decision in the House of Commons which led to the fall of the Whig Government under Lord Melbourne.

"Windsor Castle, August 28th, 1841.

"The Queen has received Lord John Russell's letter of this morning, containing the account of the division in the House of Commons.

"Long as the Queen was prepared for this event, she does not for that feel it the less painful. She is deeply grieved to have to part from those she has such confidence in; she trusts, however, that at no very distant period she will again see Lord John Russell in the office which he has filled so much to the satisfaction of both his Sovereign and his country.

"The Queen feels very grateful for Lord John's kind wishes for herself, and cannot conclude without expressing the lively interest she will ever feel in his personal welfare and happiness, as well as in his career in public life."



When Earl Russell sought a rural retreat for himself and family, it gave her Majesty true pleasure to place at his disposal Pembroke Lodge, in Richmond Park, where the venerable statesman closed his days. Among the memorable events witnessed in that delightful home, one was the reception of a deputation from London, on the jubilee of the Repeal of the Test and Corporation Act. The aged patriot spoke with much feeling and cheerfulness, and expressed his gratitude for having been permitted to do so much for freedom and his country.

Most people have heard of Sydney Smith's witty description of Lord John's self-confidence and courage. "There is not a better man in England," he wrote, "than Lord John Russell, but his worst feature is that he is utterly ignorant of all moral fear; there is nothing that he would not undertake. I believe he would perform the operation for the stone, build St. Peter's, or assume (with or without ten minutes' notice) the command of the Channel Fleet; and no one would discover by his manner that the patient had died, the church tumbled down, and the Channel Fleet been knocked to atoms." Sydney Smith adds that "his measures were often able and his motives always pure." That he made some mistakes, like other statesmen, is true, but, unlike some statesmen, he had the honesty and moral courage to own them. Very touching was the scene on his death-bed, when he said to his sorrowing wife, "I have made many mistakes, but in all I did my object was the public good." To Lady Russell, after his death, Mr. Bright wrote a sympathising letter, in which he spoke of his having "always observed in Lord John's public life a moral tone, a conscientious feeling, something higher and better than is often found in the guiding principles of our most active statesmen." The "Life" as presented by his biographer will show to all the world how great a statesman and how good a man his country possessed in Lord John Russell. Much of the book bears on questions still before the public, and contains lessons of wisdom, prudence, and patriotism to the statesmen and politicians of our own time.

Mr. Walpole has much to tell of the literary works of Lord John, but these have little interest in comparison with his political career. Of his numerous writings, those most worthy of remembrance are "The Memoirs of Charles James Fox," "The Life of William Lord Russell," "Inquiry into the English Government and Constitution," and "The Memoirs and Correspondence of Thomas Moore," edited for the benefit of the family. For Tom Moore he retained to the last his friendly feeling, and to him, as to many struggling men of letters, he proved a generous benefactor.

Many subjects we have to leave untouched in the record of Lord John's public career, nor have we space left for referring in detail to what will be to many the most delightful part of Mr. Walpole's book, the gentle and sweet home life which, from his first marriage till his retirement from office, forms the background of the stirring movements of his public career. His home was of the purest and noblest type of English life, and few readers can close the book without feelings of increased affection for the man as well as higher admiration of the statesman.

JAMES MACAULAY, M.D.

# A MOUNTAIN ROMANCE.

BY LINDA VILLARI.

I.

UNTIL my last daughter married and went off to India I had never known what loneliness meant. When the elder girls left me I had missed them of course, but it seemed quite natural to see them take flight, and I had always Maggie—my little Maggie! Now she too was gone. Her Prince Charming had dropped from the skies and won her with lightning speed. Almost before I had time to take breath I was left alone in my big silent house, too listless to leave it, life at a standstill, energy crushed. And, being supposed to be strong-minded, no one pitied my loneliness. Had I been one of your meek, mild, helpless, clinging little women, plenty of friends would have flocked round me. As it was, they all said, "Oh, Joan Stewart is so energetic, so full of resources!" Even my children seemed to think mother could get on very well by herself. I managed to live up to my character so far as to make no moan, but I was thoroughly hipped. Accordingly it was a delightful surprise one day when my brother, Christopher Crane, walked in. He had just come from Paris, seemed surprised to find me on the sofa, looked at me closely as I gave him Maggie's last news, and then suddenly said, "Look here, Joan, I'm off to Italy next week, to escape the season and finish my book in peace. Couldn't you come and take care of me?"

This was startling. I kissed him, sighed, and said I wished I could.

"What's to prevent you?" he asked; and somehow before five minutes were over all difficulties and doubts had been swept away. I had called him my good angel, closed with his offer, and felt a delicious sense of freedom quickening my pulse.

It seemed a return to the boy-and-girl days when we two had faced the world side by side. Since my marriage circumstances had kept us apart, and, though our love remained strong as ever, intimacy had slackened. Now, on this pleasant journey we picked up all the familiar threads, rediscovered each other, and found that years had changed us less than we supposed. There was much of the old Kit under the famous novelist's literary crust, while the old Joan began to reappear with a vigour surprising to herself before we were half way to Piedmont.

That was early in May; since then we had passed a happy month among the vines near Ivrea. Italian villa life was a novelty to both of us, and, with May Zanzi and her charming Italian Count at a stone's-throw from our door, we had the best of company within call. The peaceful hours rolled placidly on. Kit built up his book, unharassed by notes or engagements. I pottered about among the flower-beds, revived my faded Italian, wrote endless letters to my scattered children, and helped Kit with his proofs and references. Then later in the day, unless the Zanzis came to us, we dropped in on the Zanzis, and, lounging on their shady lawn or pacing the

terrace overhanging the river, held long discussions on books and men, politics, art, and society. May Zanzi was a cousin of ours six or seven times removed, so I was an adopted grandmother to her pretty babes—and almost to her pretty young self. We drove and rambled about the country together, explored old castles, made acquaintance with one or two interesting neighbours, and closed our gates against bores.

The scenery was enchanting. Just here the foothills of the Alps sank rippling into the plain. We were near the mouth of the Val d'Aosta, and beyond its rocky jaws rose a grand background of shadowed peaks and glittering snow-crests, grim precipices and gentle slopes. The flashing waves of the Dora coursed through the trees at the base of our hill, and, after gambolling about the walls of Ivrea in silvery arabesques, streamed away through the level land towards Turin. I rejoiced more and more in our nest, in our free, unconventional life. Age and care slipped from me; I felt ridiculously young, even began to talk of buying the little house among the vines and giving up the desolate London home. That was all in the first month; then the dream changed. The sun blazed more and more fiercely, the plain quivered with white heat; all day the cicalas' ceaseless note stabbed our nerves as with red-hot pins, frogs croaked all night, and the strange, flattened ridge of the Serra, thrusting forth into the plain, became odious to the sight—in spite of its geological dignity as an ancient moraine—when we thought of the cool wooded region it hid from our eyes. Our ink was always drying up, our fingers were always sticky, we had to keep our rooms airless and dark; we often fell asleep over our books, clothes became a burden, exercise impossible. We only sought our neighbours after sunset, and even then conversation flagged, our main interest being in iced drinks or the chances of rain. We were stupid and limp or wrathful and snappish. Was it always so hot here, we grumblingly asked, and were told, of course, that no such heat had been known in the memory of the oldest inhabitant. My daughters no longer made fun of the friskiness of my letters, but wrote me sermons on the folly of staying in a furnace instead of returning to our own temperate clime. We fumed and fussed, but how could we desert the Zanzis, who had refused a good offer for the little house in order to secure our companionship?

Then—I had almost said, fortunately—one of May's babies fell ill, and was ordered to the sea. Should we stay to roast alone? No, we would go also, but not to the sea. Friendship dissolves above 28° centigrade; we declined to brave the glare and crowd of a Mediterranean bathing-place; we would go to the mountains instead. Said and done. A day or so of preparation and packing, and one morning, soon after dawn, we were all at the Ivrea station waiting for our respective trains, the Count and family bound for Genoa, ourselves for the Val d'Aosta.

May and I were soothing the sick baby, when Christopher came to me with a startled face and hurriedly whispered, "Look there to the right! See what a resemblance!"

I looked as directed, and one glance at the slender girl standing beside an elderly nun was enough to explain my brother's agitation. Both face and figure were those of the girl-bride torn from him by death twenty years before. It was the strangest, most exact resemblance. I took Kit's arm and led him to a quieter part of the platform. This vision of the past had completely unnerved him.

"So like, so like!" he murmured. "If I could only hear her voice! It might be my Nellie herself!"

His emotion astounded me. So, this cheerful middle-aged man of the world, this humorous observer of life, was still faithful to the love of his youth, the brief romance of which he had long ceased to speak, even to me! But of course not to me! I had had troubles enough, it was true, but however keenly felt at the time grief always slips from me as water from a duck's back. I felt a twinge of shame for my slighter nature as I gauged the depth of Kit's fidelity.

A bell rang, a horn sounded, guards were shouting "Partenza!"

"Oh, Kit, we shall miss the Zanzis! We must say good-bye to them!" I cried.

In fact, the Count was already lifting his little girl into the carriage, his wife beckoning to us. She was speaking with the nun, and Nellie's double was smiling.

"Oh, Christopher—Joan! I want to confide these friends to your care. They, too, are bound for Pont St. Martin, and there is no ladies' carriage."

Kit silently bowed, but I hastened to express a hearty assent. A few minutes later the Zanzis were gone, and we were in our train with girl and nun on the opposite seats. After politely stowing their bundles and baskets up aloft with our bags, Kit withdrew to the further corner with an Italian newspaper spread before his eyes. It was upside down, but it served as a screen, and the flimsy sheet shook a little whenever Nellie's double opened her mouth, for her voice, too, was almost the same—soft and low, with a plaintive note in its cadence. But the nun and I did most of the talking, and the former's headgear of black hood and white veil, thrust forward in a poke, framed a face of quite unconventual vivacity. She was a teaching sister, she said; their house comprised among its pupils all the rank and fashion of the province. Her dear young charge had finished her education, and was returning to her home in the Val de Lys. Did I know the Val de Lys?

I should know it in a few hours, I replied, for we were bound for Gressoney St. Jean, near the head of the valley.

"Guardi!" and two fat, brown hands were raised in amazement. "Elena,"—so Nellie's double had even Nellie's name!—"dost thou hear, child, the Signori are going to Gressoney!"

The girl murmured her pleasure with a sweet smile to me and a timid glance towards the silent man behind the paper.

"I go only to Pont St. Martin," continued the

nun; "but Elena will not incommode you. Her father will meet her at the inn. Signor Denabian, you know," she added, *sotto voce*, "is one of the richest proprietors of Gressoney, a descendant of the ancient race that once held sway over a vast territory."

The poked veils nodded with quite a worldly emphasis as their wearer enlarged on the social standing of her pupil.

Fresh from perusal of guide-books to the quaint region we were about to explore, I nodded in sympathy. So this pretty girl in the modest stuff frock was the representative of the daring German Captain Denabian, whose prowess had won from his emperor, Otho III, somewhere in the eleventh century, the gift of the lands of Gressoney!

Meanwhile, losing her shyness, Nellie's double was gazing out on the landscape with pleased cries of recognition. It was six years since she had seen it, she told Kit, who had dropped his paper to let down the sash for her, and, though so happy with the kind sisters, she had often yearned for her mountains. The nun was amusingly shocked and surprised to see her pupil talking with Kit, and eyed the latter with a certain suspicion. Yet even convent decorum could scarcely take alarm at the mild courtesies of a stout, bald-headed, grey-bearded Englishman. It was almost comic to note how reverentially my brother spoke to this little chit of a schoolgirl. Her resemblance to his Nellie had raised her on a pedestal.

Arrived at our station, Sister Michela collected her pupil's belongings with businesslike promptitude and bade us farewell, with many thanks for our kindness. Signor Denabian would be waiting for his daughter at the inn, and she must hurry back to Ivrea by the next train. Nellie's double shyly returned my kiss, saying she hoped to meet me at Gressoney, and the couple presently disappeared, in a cloud of dust, down the straight white road through the vineyards.

We were detained some time at the station by having to telegraph to Ivrea for a missing box of books, and this loss recalled my brother to actualities from dreams of twenty years ago. It was a delicious morning; the leaping waves of the Dora gave a cool effect to the landscape, and the sight of the brisk, smiling muleteer arranging our luggage on pack saddles woke the holiday spirit in my matronly soul. Hunger, too, was strong within us, so, leaving the cavalcade to follow at leisure, we also drove off to the inn.

The little town of Pont St. Martin spreads among vineyards and gardens at the base of steep wooded slopes, and straggles up the side of a narrow gorge, through which the Lys torrent, spanned on high by a noble Roman bridge, comes leaping down to the Dora.

We were soon seated among the oleanders on the terrace of the "Golden Rose," and a dramatic hostess placed the whole resources of her establishment at our disposal. As these included black coffee, trout, and that ideal form of bread, crisp *grissini*, we fared well, and before long Kit remarked, in a cheerfully commonplace way, that the pretty Elena must be miles on ahead by this time. But half an hour later, while our mule-driver—or *cavallaro*, as he was styled—was fastening our bags to his packs, and I was watching the process with a certain anxiety, our travelling companions suddenly appeared at the further end of the balcony on which I was standing. Sister Michela came straight towards us. She looked flushed and annoyed.

Such a strange thing had happened, she said, hurriedly. Signor Denabian had been prevented from coming, and sent a message begging her to escort his daughter all the way to Gressoney. It was most vexatious, most bewildering! She had never, never mounted a horse in her life; she was expected at the convent! What the Mother Superior would say—*Basta!* And the poor flustered woman closed her lips with a snap and hurriedly crossed herself as she checked the evident temptation to express her sense of the monstrousness of Denabian's request. The girl stood in the background with meekly folded hands, but her pretty eyes sparkled with amusement, as though she already beheld the nun in the saddle.

Kit glanced at me, then, turning to Sister Michela, "If we could be of service—if you would trust the young lady to us," he stammered in laboured Italian, "we would take every care of her—see her safely to her father's door. She shall have my mule. I shall enjoy stretching my legs on a mountain road."

The nun caught his meaning at the first word, and it was curious to see the play of startled caution and relief on her honest countenance. She hesitated a moment, cast up her eyes, murmured a hasty prayer, and then, with the air of one taking a most adventurous and dare-devil resolution, closed with the offer. I added a few motherly assurances, and in reply she pressed my hand, declaring she knew she might trust her pupil to us—such staid, worthy people, and relations, moreover, of her kind friend, Countess Zanzi. If Signor Denabian and the Mother Superior should blame her—well, it could not be helped. The gentleman would not have to resign his mule, the horses had been sent. Raging beasts, they seemed to her, but Elena said they were lambs. In fact, two sturdy, placid animals were already by the gate with our mules. I glanced at our charge; she had remained demurely aloof, but, now the matter was settled, seemed pleased with the arrangement.

"You are not afraid to come with us?" I asked, with an encouraging nod.

"No, indeed—very glad," she replied, in her ready French, and clasping her hands with a charming little air of relief. "The ride is long, the way rough; dear Sister Michela would have been *killed!*"

So it was all settled, and I could see that we had risen many pegs in the estimation of our dramatic hostess and the other bystanders.

In a few minutes we were all mounted, and the nun, after taking Elena to her arms in true motherly fashion, and impressively bidding her return to the convent should trouble overtake her in the world, withdrew to the balcony, and stood waving farewells with a half-guilty air, and a few

tears trickling down her cheeks. Off we jogged in single file: first the pack mules bearing our poor trunks, roughly secured with ropes and sticks, then burly Kit, with his dust-coat flying loose, next Elena, then myself, the spare horse sent for the nun in the rear, and Beata, our nimble *cavallaro*, running to and fro along the line. It was a good thing that Sister Michela had refused to come, for, once through the crooked little town, we turned up a steep, slippery causeway, sharply zigzagged on the mountain-side, leading to the mouth of the gorge above the Roman bridge. It was a stiff beginning for the day's work. I could scarcely keep on my animal's back, expected to fall off at every jerk, and could give few glances to the fair valley beneath us, or to the growing army of guardian peaks. Our mountain-bred companion, however, seemed quite at ease in the saddle, and was chatting gaily in dialect with the youth at her bridle, who was evidently an acquaintance of old standing. At last the ascent

CHARCOAL CARRIER OF THE VALLEY.

came to an end; huge chestnuts shadowed our path; we halted to take breath, and Beata was again busy with the never finished task of re-adjusting the burdens on his mules. The glowing landscape of the Val d'Aosta was all shut out now. We were in a deep, narrow valley, with billowy forests of chestnuts on either side, above and around us. Far beneath, at the bottom of the gorge, raced the Lys, its white-crested rapids subsiding now and again into still, blue-green pools.

There was a ruined castle on a height across the valley, clustered brown roofs and slim white belfries peeped here and there among the trees; but we seemed almost out of the world in this cool sylvan solitude, where tiny half-hidden streamlets coursed past mossy rocks with melodious babble, and the sky seemed a scrap of blue enamel crossed by a network of chestnut leaves. The light came filtered through an emerald screen; but now and then we passed meadow slopes, where stately women, broad-browed, blue-eyed, and with red cloths knotted round their heads, stayed their work as we went by, to exchange smiles and jests with the *cavallaro*.

My delight in the scene soon drew Elena to my side. The girl's shyness was gone; convent manners left behind with the nun. It was good to see how frankly she rejoiced in her freedom, in her return to the mountains. Few questions were needed to extract the tale of her life. It was simple enough. She could not remember her mother; a kind old aunt had brought her up. She used to go sometimes to the village school, but in summer had spent most of her time in the woods and fields, clambering over rocks, mounting even to the snow with her cousins and Franz. Franz was her favourite playmate, he was so strong, so kind. In winter—oh yes, it was dull in winter, though on fine days it was nice to go sledging. But during the great snowfalls they would be shut indoors for weeks at a time, could not even go to mass, and generally lived in the stable.

Probably I showed some amazement at this, for the girl hastened to explain that there were no such stables in the world as those of Gressoney. I should see how clean and pleasant they were. The best people made *salons* of their stables, she added, with a touch of convent primness, and the poor folk always slept in them during the winter months. She had been very sorry to leave home. That was six years ago, when she was nearly twelve. Her grandmother had returned from Paris, been vexed to find her so ignorant, and made her father send her off at once to the convent. "Grandmamma was extremely despotic; everyone had to bow to her will." But she accompanied this remark by a mutinous little grimace, that gave no promise of implicit obedience for the future.

"Your father must have been very unwilling to part from you," I said, thinking how natural it was for the poor widower to prefer to let his child run wild at home.

"My father! oh no, he didn't care; he had forgotten my age. He is always occupied with his farms."

"Depend on it, he'll be glad enough to have you back; you will brighten his home," remarked Kit, very gently.

Elena smiled vaguely, but made no reply. She did not seem much attached to her father, I thought, and began to meditate on the fatal slackening of domestic ties brought about by convent training. Just then a village priest came trudging towards us down the path. He had a folded surplice on his arm, and a boy at his heels carried the little vessels used for the sacraments. He halted to say a word or two to our guides, whereupon Elena pushed hastily on with a little cry, and Beata explained that there was an accident,—someone hurt in blasting a rock further on.

II.

SURELY enough, at the next turn we came on the tragic sight. Just where the path dipped down towards the torrent, under a bower of chestnuts, where sunbeams flashed merrily through breaks in the foliage, stood a litter, the bearers of which had halted for breath. The poor victim lay stark and still, with blood-stained cloths about his head and a rough canopy of branches to shield him from the glare. The livid rings beneath his closed eyes seemed all the more ghastly by contrast with the streaks of gore on his tanned, brown-bearded cheeks. Strong, workman's hands, knotted and toilworn, rested passively on his breast. A young lad, with a miner's lantern still alight in his hand, leant huddled against a tree in an agony of grief. Elena Denabian had dismounted, was eagerly questioning the bearers, and when they shook their heads in reply I saw her quietly empty a very small purse into the pocket of the weeping boy.

For the poor man there was nothing to be done—he was past human help. Elena tearfully explained that he had been struck on the temple by a fragment of rock, was being carried back to his home, and she pointed to a cluster of sun-kissed roofs high up among the woods on the opposite side of the valley. "He has a young wife and several children," she added. "Imagine what they will feel! It is all too horrible! Why should death strike down the young, and in this peaceful, happy place?" And then she hurriedly crossed herself as if repenting these words of revolt.

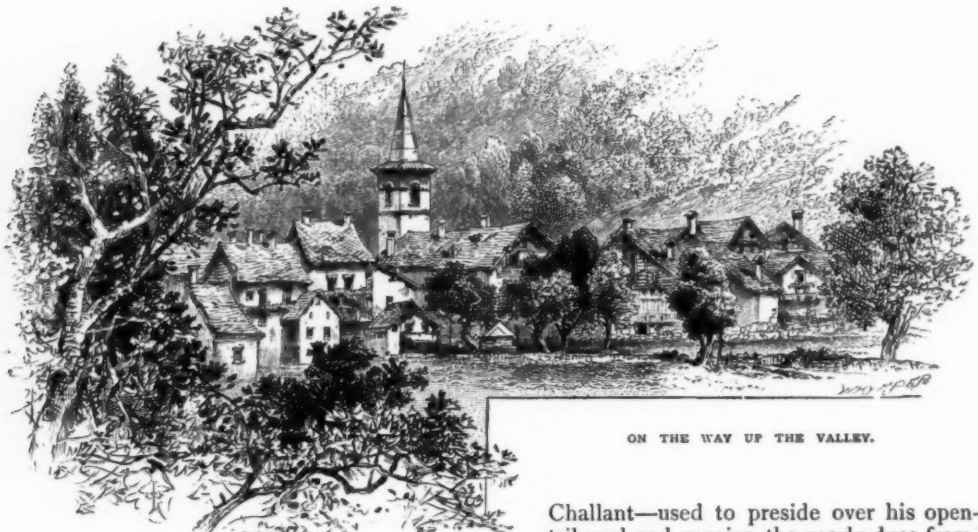
"After all," remarked practical Kit, "the poor fellow may have some life in him still. A doctor was more needed than a priest. We might send him one from the next village."

The girl shook her head. "If not dead yet, he will be dead long before the Pont St. Martin doctor can get to him, and there is no other medical man in the valley excepting at Issime, four hours further on. No, not even at Gressoney," she added; her father and the syndic had agreed that the women would always be ailing if they had a doctor within reach.

Kit laughed. "Sensible people!" he exclaimed. "It speaks well for the healthiness of your native place, Signorina, but so Spartan a mode of life must be inconvenient at times. Is the Issime man ever to be found at home, and is he clever?"

Elena did not know; she thought there was a new one there now from Turin. And then she once more recurred to the spectacle we had just seen, and I grieved that the joy of her home-coming should have been damped by so dismal an experience.

Now the valley grew wilder at every turn. Our path sometimes skirted the water's edge, sometimes passed high above it by frail bridges across side ravines, where torrents thundered down to the Lys. Our guide told us that in winter these gorges were choked by hard snow and ice, and that he often had to strike out a new path much higher up when bearing the mails to and fro. It was a rough life, but he liked it. He always rode my mule, it was the most surefooted of all. He often slept on its back, leaving it to pick out the way. This cheery *cavallaro* was on the most confidential terms with his beasts, reasoning with them when they stopped to snatch tufts of grass, encouraging them up steep ascents, watering them at wayside troughs, and feasting them on dried chestnuts in the tumble-down village of Lillianes.



By this time we had forgotten our breakfast, and were glad enough when the bell-tower of Fontainemore came in sight. Passing through a labyrinth of huddled houses, terraced gardens, and yawning archways, we clattered over a high-peaked bridge to the inn, and dragged our stiffened limbs up uninviting stairs to the room where we were to lunch. Elena anxiously explained that this was not like Gressoney—we should find no dirt there. At first she refused to join us at table—had no appetite; would rest while we ate. But, remembering what she had done with her purse, we guessed how matters stood, and insisted on her being our guest. In fact, the child was as ravenous as ourselves, and did full justice to the meal. Now that she was flushed by her ride, the resemblance to poor pale Nellie was less apparent; but my motherly heart warmed to the bright young thing chance had thrown on our hands. She was a charming companion, with natural winning ways beneath the crust of convent demureness, and with all the legends of the valley at the tip of her tongue. There had been rich gold mines down at Lillianes, she said, until the lord of the place cheated the Church of its dues and cast the Pope's collector into the smelting furnace. From that moment, hundreds of years ago, the vein failed, and a curse had rested on Lillianes. We had seen how poverty-stricken it was.

In her turn she was surprised by our guide-book lore, and proud to find that so much was written on her valley in a foreign tongue. She was eager to hear about England—chiefly, I thought, from having heard it stigmatised as a pagan land, and she evidently regarded it as an Arctic region of eternal night. Kit excited her amazement by a highly-coloured sketch of an English girl's life, in which the pursuits of a Girton student were skilfully blended with those of a Belgravian fashionable and a sister of the poor.

"Can your daughters do all these things, Madame?" she asked, with a puzzled look in her violet eyes. "I thought English ladies only cared to climb mountains."

"My nieces do everything, and have dozens of babies into the bargain!" interposed the exaggerative Kit. "And as for mountains, you'll see my sister on the highest peak of Monte Rosa before long. You must come with us, Signorina."

"God forbid!" exclaimed the girl, crossing herself. "We, sir, fear the ice; it is no playground to us. Like the monster in a fairy tale, it claims its victims every year. There is no family in Gressoney that does not mourn for someone lost on the ice. My own grandfather perished in a crevasse twenty years ago, and ten passed before his body was found. I remember seeing it laid in the churchyard. Oh, the glaciers are terrible!'

ON THE WAY UP THE VALLEY.

and the girl shivered as though she already felt their breath.

We were in the saddle again by this time, and soon the steepness of the track stopped all conversation. We had stood on the bridge over the famous "Gouffre de l'Hellex," where the pretty Lys, transformed into a fierce cataract, tore its way through the rocks far beneath; we had seen new peaks—grey, purple, and snow-crested—start up on either hand; we had left the chestnut-glades behind, and were in a region of ashs, walnuts, and alders. The rock-walls above us were dark with pines; the rush of waters was ever in our ears, we were dazed by the sun, shaken and weary, before we reached the broad valley of Issime.

Here it was hard to realise that we were still in Italy. Every passer-by greeted us in German. The peasants working in the fields were tall, stalwart men, with red or flaxen beards, and strode about in clumsy wooden shoes. The buildings were equally Teutonic, having broad, shingle roofs, wooden balconies, and flower-gardens, neatly enclosed by green and white palings. Many of the houses were solid, well-kept, spacious mansions. Elena explained that nearly all the male inhabitants went abroad to make their fortunes, and then came home to live at ease. Their woods, pastures, and sheep-farms could not give employment to all, so these active Gressoney folk supply North Italy and Switzerland with engineers, road-contractors, masons and navvies, and regard Switzerland as their special El Dorado.

After the solitude of our mountain-path Issime seemed almost a town, and it is practically the capital of the valley. Its ancient, quaintly-frescoed church fronts a spacious green, on one side of which is the Gräfenstuhl, a high stone seat flanked by lower benches, where the feudal lord of the valley—generally some Count of the House of Challant—used to preside over his open-air tribunal and receive the yearly dues from his vassals. There was time to examine the place while our mules were being watered at the fountain. This mountain-girt centre, half town, half village, seemed curiously typical of half-developed social needs. It had a few arcaded stone houses and public buildings, flanked by lanes of rustic hovels; it had a mayor and corporation, but no hotel; wealthy inhabitants, but no shops.

We had just remounted, when a young man on a rough pony came in sight trotting down the road. Like everyone else we had met by the way, he had a word and a smile for Beata, bowed slightly to us, and seemed about to pass on, when, glancing at Elena, he started, and riding up to her seized her hand with exclamations of delight.

For a moment the girl seemed surprised, if not frightened, by his impetuous greeting; then a glad light flashed from her eyes as she cried, "Franz, dear Franz! Is it really you? But you are a man!"

"No doubt as to that!" whispered Kit in my ear; "a very fine one, too."

A rapid duet followed, and then our companion turned to us with a radiant face.

"This is my old playmate, Franz Bondaz. I thought he had gone away for ever."

Thereupon the young man raised his hat with quite a town-bred air, and said that, having heard the signorina was expected, he had been on the look-out for her and the nun.

"Why didn't you come to Pont St. Martin?" asked Elena, quickly.

The young man laughed—a cheery baritone laugh that was good to hear.

"Not so easy to play truant now, Lena, as in old times—too many patients to visit. Indeed, had I not waited for a glimpse of you I should be at La Trinité by now."

"Pray ride up the valley with us, doctor," said Kit, who seemed most favourably impressed by this new acquaintance.

"What!" cried Elena, "are you the new doctor from Turin? I am glad! Now you cannot run

away from the valley. Yet you always said you would go to the end of the world. What made you change your mind?"

"I can't tell you now," said Bondaz, gravely. "Much water has run to the sea during the six years you have been at school."

We rode on quietly for some minutes, when Elena suddenly reined in her horse, saying, "Oh, Franz, I had forgotten! You must not come with us!" and then she spoke of the dying man at Perloz.

He listened attentively, his eyes fixed on her sweet face, but shook his head and turned appealingly to me.

It was hard, he said, to have to say no to Lena's first request. He would have gone willingly, although Perloz was not in his district, but he was called to a serious case at La Trinité, and, in fact, would be obliged to leave us and hurry forward as soon as we reached easier ground.

We had just climbed up a stiff ascent, amid a chaos of fallen rocks, had left the fair vale of Issime, and were winding through the defile that is the natural gate of Gressoney. The Lys was thundering in wild leaps through a series of cauldrons fed by tributary cascades flashing into it on either side; and, in spite of the blazing sun, the air was deliciously cold and exhilarating.

Elena and her friend chatted rapidly in German until we reached a wayside shrine at the summit of the pass. Then, without even waiting to breathe his pony, which was plainly accustomed to a quicker pace than that of our luggage-laden cavalcade, the doctor raised his hat and clattered briskly downhill. The girl looked after him with wistful eyes. I remarked consolingly, that our journey must be nearly at its end.

"Yes, we shall soon reach my dear Gressoney; and it is so wonderful to me to find Franz here when I thought he had gone away for ever!"

"It is plain that he is a very old friend of yours," remarked Kit, in a fatherly tone.

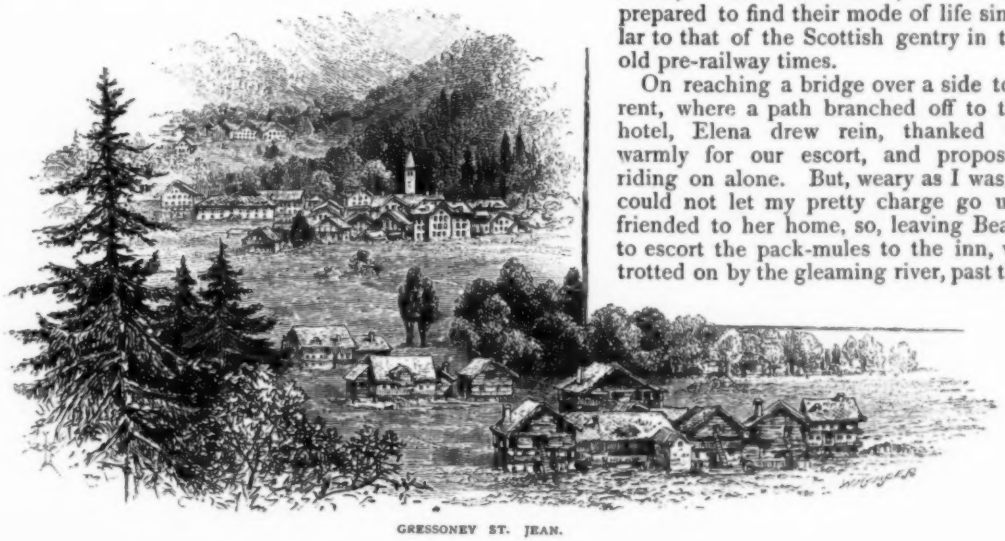
"We were always together," was the simple reply; "and he used to stand by me against my big, rough cousins, who always wanted everything their own way."

"They will be meeker now, and content to obey you," rejoined Kit, gallantly.

"Even then, I shouldn't like them any better," replied Elena, with puckered brows. "They were as tyrannical as grandmamma herself. I *hope* they are not at Gressoney! But—ah, see, Madame, there is the Lyskamu! Is it not beautiful?"

The rock-walls had fallen back; we looked on a pleasant smiling vale, and a great glittering snow-crest rose before us, where pine-clad heights and serried peaks drew together at the head of the basin. Little hamlets lay dotted about on the plain, dark woods streamed down to the edge of the fields, and here and there we saw the silver flash of our river among the trees. Another sharp descent, and our course lay over fairly level ground, between bushes and rocks, past one or two villages, and there was the spire of Gressoney above a confusion of roofs.

Elena clapped her hands and looked round with joyful eyes. "That must be my cousin's new château," she said, pointing to an imposing building of composite architecture, half castle, half chalet, against the hillside; "and there, Madame," she added, "is your hotel close by it—that house with balconies on every floor."



"And can you see your own home?" I asked.

No, she said; that was on the piazza near the church, and hidden by her grandmother's old house.

Kit rode to my side with a contented face. "We have found a true vale of rest, Joan!" he cried. "No fear of strong emotions here!"

I was too weary to be capable of enthusiasm, but I liked the look of the place, and our new friend, this lovable girl, gave it an added charm. We might see something of local life, instead of being reduced to Pension acquaintances. These Denabians would be interesting specimens, no doubt, of rural aristocrats, and I was prepared to find their mode of life similar to that of the Scottish gentry in the old pre-railway times.

On reaching a bridge over a side torrent, where a path branched off to the hotel, Elena drew rein, thanked us warmly for our escort, and proposed riding on alone. But, weary as I was, I could not let my pretty charge go unfriended to her home, so, leaving Beata to escort the pack-mules to the inn, we trotted on by the gleaming river, past the

GRESSONEY ST. JEAN.

château, and over a stout bridge to the village square. This was an irregular space, flanked by substantial houses, with a Gräfenstuhl, like that of Issime, against the further wall. At one corner of the square we saw a grey-headed woman craning over a balcony filled with bright flowers.

"Tante Luisa, Tante Luisa!" cried Elena, joyfully. "Franz has told her I was coming!"

Just as we drew up at the neat brass-handled door beneath the balcony, a queer figure ambled towards us from a side street. It was a bottle-nosed, hunch-backed old man, his head half buried in the collar of an enormous great-coat, concealing nearly the whole body of his horse under its wide green skirts. This figure blinked at us distrustfully with watery little eyes, and, nodding coldly to Elena as she leapt from her horse, said, in grating tones,

"So, you've come at last, Lena, no thanks to those foolish nuns. There, get indoors to your aunt. I shall be back soon," he added, waving her away, as, springing towards him she stood tiptoe, raising her sweet face for the expected caress. She shrank back at the harsh rebuff; her eyes filled with tears.

"Won't you thank this kind English lady, this gentleman?" she stammered timidly, "they have been very good to me on the journey."

"Your servant, your servant; much obliged," mumbled the old boor, with a half-nod to each of us, and, riding away up the side street from which he had emerged, afforded us an excellent back view of his big green coat and shapeless hat.

"Pray excuse my brother, he does not understand; we are most deeply indebted to you," said a gentle, quavering voice, and turning from contemplation of the noble Denabian, I saw Tante Luisa on the doorstep and Elena clinging round her neck. She was a withered little woman, dressed like a peasant, but her voice was refined, her face full of feeling. Kit and I said a few polite words, and as I bent down to kiss the dear young girl, Tante Luisa joined her in entreating us to come to drink coffee with them the following afternoon.

As we rode away, a tall, swarthy young man, with a gun over his shoulder, came across the square to the door we had just quitted.

"That is the Signorina's cousin, Baron Felsen," said our *cavallaro*, who had just rejoined us. "He is the richest man in Gressoney; half the valley belongs to him. People say he is to marry the Signorina, but his grandmother, the old baroness up at Chamonal, doesn't find him easy to manage. He, too, has a will of his own." And Beata accompanied his words with a gesture expressing little love for the village magnate.

"So that sweet girl's fate is already settled!" remarked Kit, meditatively. "There's material for a sensational novel in this primitive valley. An impossible father, a despotic grandmother, a fascinating doctor, a black-browed baron, and this blue-eyed innocent fresh from the convent. Poor little thing! I might have had a child just her age. I hope her people will be good to her Don't you pity her, Joan?"

"Oh! yes," I murmured faintly, "but I'm too done up to feel much interest in anything. Thank heaven, here is the hotel! We can rest at last."

Oh, the comfort of that perfect little inn! No angel could have ministered better to our wants than the charming hostess in red-cloth skirt and black bodice, who, welcoming us as though we were old friends, led us to dainty wainscotted rooms overlooking the valley. We were lulled to sleep by the murmur of falling water, and awoke new beings—albeit with some aching reminiscences of our nine hours' ride—to rejoice in the crisp air and jocund sunshine of this tranquil mountain retreat.

## Father's Room

WITH eager footsteps, every night,
Five little ones repair
To father's room, and with delight
They cluster round my chair.

And Bertie brings his picture-book,
And all in chorus plead—
While baby climbs my knee to look—
"Now, father, will you read?"

For nurse's step is still unheard,
Though she may shortly come;
And so—afraid to lose a word—
The rosy lips are dumb.

Stories of lions, and of men
Who crawl on hands and knees—
Truths written by a golden pen—
Their faith is great in these!

They deem all hunters carry guns
That never miss their aim;
Oh, tiny daughters, little sons,
My dreams were once the same!

Come, teach me how to rise above
My thoughts of doubt and gloom;
Come, children, with your faith and love,
And brighten father's room.

J. R. EASTWOOD.

# A CRUISE AMONG THE SOUTH SEA ISLANDS.

## III.—ATIU AND RAROTONGA.

CONTINUING our cruise, we arrived at the island of Atiu, one of the Cook group, on the day following our departure from the Hervey Islands. An entire change of scenery relieved our eyes, somewhat wearied by the continual sight of coral and cocoanut. Atiu we found to be an island of some twenty miles circumference, rising in gentle ridge-topped hills to a height of 380 feet above the sea. It was discovered by Captain Cook in 1777, the natives then, as now, being remarkable for the friendliness of their disposition. The hill-sides showed plantations of cotton, banana and cocoanut, or, where uncultivated, patches of red-brown earth half-hidden among bushes and scattered trees. The valleys between the ridges and the level country by the sea-shore were full of luxuriant vegetation, which reached down to, and overhung, the grey volcanic rocks backing the sandy beach. The whole island looked cool, fertile, and inviting. Closely adhering to the shore was a fringe or belt of coral, about eighty yards in width, whose smooth surface was only a foot or two below the sea level. Upon its outer side the sea broke in a gentle surf—the wind being light—and each receding breaker showed the table-like edge of the brown coral, there descending precipitously to a vast depth. Even within a few yards of this belt we could obtain no anchorage, and accordingly had to lie "off and on," during our visit, abreast of the landing-place. The latter was only practicable for canoes, which could ride over or through the surf, traverse the shallow water covering the coral, and so reach the beach inside. Leading up from this beach, through the rocks behind, was a red road winding away in shade among the trees.

On our arrival, a few of the natives came off in canoes; others assembled on the rocks at the landing-place. The visit of even a small craft like ours was something of an event, for the vessels calling at this island, though regular, are infrequent.

With a companion I landed in one of our own boats, which took us to the edge of the reef. One of the natives came ashore with us, and carried us on his back over the reef to the beach. He was a burly, good-humoured fellow, whom we afterwards found to be the king's son, and heir to the local throne. Local, because no less than three chiefs ruled over the island—two kings and one queen, each governing a separate district independently.

Dropped in somewhat undignified style from the royal back, we greeted the natives assembled on the beach, who returned our salutation in friendliness, but with much curiosity. Walking up the road already mentioned, a few yards above the beech we found, under a big bread-fruit tree, the king, to whom an officious native introduced us. His majesty was a pleasant-looking man of massive build, attired in an Oxford shirt, a pair of grey trousers, and a straw hat. He received our remarks with genial guffaws, signifying rather approbation than comprehension. After the interview, brief by reason of mutual limitations of language, we proceeded on our walk, intending to reach the chief town, or rather village, about three miles distant.

The road leading thither was extremely beautiful, in this lower part winding through a wood of glorious variety and richness, whose trees shaded the way pleasantly. Beneath them, on either side of us, the ground was rocky and volcanic, forming dark nooks and curious grottoes, in which grew abundant ferns and spreading creepers, many of which ran gracefully up the tree-trunks.

Now and then we passed through a plantation of bananas or cocoanuts, characteristic of tropic scenery, whose wide and curving branches waved over our heads. Winding along the pathway towards us came groups of the island women, dressed in the loose, gaily-coloured gowns already familiar to us, and with flowers twined in their hair. They were carrying baskets of fruit down to the ship.

Soon we began to ascend a hill, the vegetation thinning as we mounted A cool breeze sweeping over the woods from the sea replaced the shade we lost. It was perfumed with the sweet smell of limes that grew here and there on the hill-side. Arrived at the summit of the ridge, the village appeared ahead of us, apparently surrounded with a palisade, or fence, for we entered through a rude gateway. The huts forming the village were scattered apart, each standing in its own enclosure, which contained bananas and cocoanuts, besides other less useful trees, such as the hybiscus (by the natives called *burao*), whose delicate, cup-like, yellow flowers strewed the ground, and a shorter dark-green tree, bearing a sweet-scented white flower, apparently a kind of gardenia. The whole aspect of this wooded village was exceedingly pleasant and pretty.

The huts were built of wood, and thatched chiefly with the leaves of the pandanus, which are largely used by these islanders for various purposes, such as making mats, fans, and hats.

Our appearance in the village attracted some attention, and we had ample opportunity of observing the natives, who assembled round us in great friendliness, evincing a merry, fun-loving, and withal gentle, disposition. As usual, the fair sex predominated in conversation, chattering and laughing among themselves, and speaking to us with a mixture of shyness and forwardness that was as charming as it was amusing. These natives were greatly superior to any we had yet seen; lighter as to colour, more delicate in feature, and symmetrical in figure. A

description of one girl will suffice for all, since the difference in dress was that of colour only. She wore the usual cotton gown, of pink striped with white, flowing from shoulder to heel. Her black hair, glossy with scented cocoanut oil, fell in two plaited tails down her back, and was bound with a wreath formed of white gardenias and separate scales of pineapple rind strung together, which emitted a sweet and powerful perfume. Behind each ear was stuck another flower, its red petals to the front. Her feet were bare, and their shape, like that of her hands, almost perfect.

All the women were similarly adorned with wreaths of flowers. The principal colours of their dresses were pink and dark red, but varicoloured stripes were also popular, and few devices were of the same pattern. The only garment worn beneath this gown was a "pareu," or waist-cloth, worn as a petticoat, which was either of scarlet or dark blue, and stamped with a gigantic pattern of leaves and other devices in white or yellow.

The men wore a variety of costumes; sometimes a coloured jersey, or a shirt flying freely outside trousers, though a gorgeous waist-cloth, similar to that worn by the women, often took the place of the latter; and in most cases their heads were similarly bedecked with flowers.

Christianity was here fully established, and a native minister conducted services in the Congregational method. The church was a large, but rather dilapidated, building of stone, and a substantial school-house testified to the fact that education was not neglected. The king's house was a large wooden building of two storeys, rudely furnished in semi-civilised fashion. Not far from it were some curious stone tombs of former kings.

Returning to the landing-place, we found that several of the natives, chiefly of the fair sex, had gone on board the ship—some on business bent, with fruit and shells to sell, others merely out of curiosity. Some of our men struck up music, in forecastle fashion, which filled our visitors with delight, and instantly set them dancing, a pastime of which they never seemed to tire. It was a matter of time to get them on shore again, but by dusk they were out of the ship, and we proceeded on our way, while they waved farewell to us. They are a merry, friendly, happy people, gentle and refined to a degree surprising, considering that not many years ago they were absolute heathens and undoubted cannibals.

We now shaped our course for Rarotonga, the principal island of the Cook group, arriving there a day or two later. Here another change of scenery appeared. The island, roughly oval in shape, and about twenty miles in circumference, is split up into rugged mountains and ravines, the former rising to a height of over 3,000 feet, and exhibiting steeple-like peaks, pinnacles, and tremendous precipices. Thick woods, rich and green, cover both hill and valley, except where the rocky peaks protrude. Clouds, at the time of our visit, clung to the mountain-tops, enriching the island with moisture, and feeding the mountain streams that ran down the steep valleys to the coast.

Partly hidden among the close-growing trees along the beach were nuts and houses, forming the settlement of Avarua. A fringing reef of coral extended round the coast, on the outer edge of which, about two hundred yards from the shore, a line of white breakers roared. Two gaps in the reef formed two miniature harbours, affording an anchorage for small vessels and a landing-place for boats. In one of these we moored very snugly.

A walk ashore showed that progress in civilisation had been made to a considerable degree. The queen, Makea (who, by the way, was married to one of the kings of Atiu), lived in a well-built house standing in a park-like enclosure. Close by stood a really fine church and large school-house. Behind the former, in a beautiful spot at the foot of a wooded hill, was the mission-house. The work of the mission, besides the general religious superintendence of this and neighbouring islands, included a college for training native ministers.

By the side of a well-kept road skirting the beach (which road extended completely round the island) stood several pretty houses in their own well-stocked gardens, the better ones occupied by Europeans; others, less carefully tended, by natives. A few shops of the "general store" description supplied the wants of the people.

We had occasion to stay here some days, in the course of which we came not only to know but to form friendships among the natives, and to appreciate the hospitality of the white residents. The more we saw of the natives, the more struck were we with their gentleness, refinement, and simple kind-heartedness. They were of course not without faults. Favoured by nature with a land supplying all their wants, the needlessness of work tended to make them indolent and sensual. They could prove themselves, too, to be dangerous; if once roused, we were told, never forgetting or forgiving an injury. But law and order prevailed, crime was rare, and immorality not apparent, at any rate, to the stranger.

Queen Makea hospitably invited some of us to dinner with her. Assembling at the "Palace," we met most of the Europeans of the island, nearly all of whom were married to native wives, who accompanied them. Many of the principal natives were of the party also, though on what principle of selection we could not tell, for there seemed no recognised distinctions of class among the people. Noticeable among the latter was the adopted daughter of the queen, an exceedingly handsome girl, familiarly known as "Jacky," who was a striking figure in her flowing gown of coloured stripes and flower-bound hair. Her classically regular features (betraying European blood), straight eyebrows, and olive skin would have furnished a painter with a perfect model for a Cleopatra.

Dinner took place in one of the lower rooms, and was served in European style, the national

luxury of baked pig forming a prominent portion of the *menu*. The queen did not sit down with us (the British Consul genially presiding), but appeared occasionally, beaming benevolence on the proceedings. At the doors and windows natives crowded in curiosity, trespassing unchecked upon the royal precincts, and encroaching, indeed, into the house itself.

After dinner we adjourned to another large room which had been deprived of its furniture and prepared for dancing. The walls were hung with wreaths and festoons of flowers, leaves, and pine-apple skin, perfuming the room. On the floor all round were seated a number of the native ladies, dressed in their best gowns and adorned with flowers. A harmonium, belonging to one of the white residents (whose sister played it), and a violin, played by another European, furnished the necessary music. Dancing soon began, in customary civilised fashion. It was a curious and picturesque scene—a wonderful mixture of civilisation and barbarism. The ladies, in their gay gowns, and dancing with bare feet, behaved with demure decorum, returning after each dance to their seats upon the floor. Conversation was of course limited, but perhaps no more lacking in brilliancy than the average small-talk of the civilised ball-room.

The heat of the room was great, free ventilation being prevented by the natives massed at doors and windows. The dances were therefore occasionally relieved by songs, chiefly sung by some of the Englishmen present. But the most interesting part of the entertainment was the singing of the native women. Songs, whether secular or sacred, are called by the natives "hímini," a corruption of the word *hymn*, introduced by the first missionaries. The "hímini" now sung were of a sacred character, being, in fact, native versions of Sankey's hymns.

The fair singers, about twelve in number, grouped themselves on the floor in the centre of the room, turning their backs towards the queen and the main body of the audience. This, it appears, is their custom—possibly through bashfulness—but the effect was amusing. Each song began with a short introductory solo of two or three bars, the remainder of the singers then bursting forth in a powerful chorus. The result was peculiar, barbarous but not unpleasing, caused by the deep, sustained, drone-like note of some of the women, and the curious timbre of the others' voices, which is difficult to describe. It was neither metallic nor mellow, but rather strident and narsh, not unlike that of a "breaking" boy's voice, loud, and deficient in expression. The general effect resembled something between a reed-organ and a powerful Jew's-harp, the latter being caused by the peculiar vowel sounds *é*, *o*, *ai*, *ah*, being peculiarly rich in sonorous vowels. Time was kept with precision, and the harmony of parts preserved, although the tunes were often altered so much that the original was barely recognisable. Princess "Jack" sang the solos and led the proceedings generally, her strange and powerful voice increasing the interest awakened by her remarkable appearance.

The affair broke up early; "God Save the Queen" was sung, and the large party quickly dispersed. We bade the kind-hearted Queen Makea "good-night" with sincere gratitude for the pleasant and interesting entertainment she had given us.

The general contentment and happiness of the natives struck us forcibly during our stay at Rarotonga. The island is divided into several districts each governed by a separate chief or "king" (sometimes a "queen,"), who makes his own laws subject to Queen Makea's approval. The Protestant religion is firmly established, and, judging from published extracts from their sermons, some of the native ministers maintain the religion with great intelligence. Marriages are celebrated according to the rites of their church. Limitations are placed by law upon the sale of liquors.

The products of the island are copra, cotton, coffee, and fruit, all of which are almost entirely in the hands of white settlers, the indolent natives not taking the trouble to pick their own cottonsince the market price fell. Cloth provisions, and general goods are imported in exchange.

A walk into the country filled one with admiration, not only for the beauty of the scenery, but for the fertility of soil, the plantations of bananas, pineapples, oranges, and cocoanuts, and the fields of taro, yam, and potato showing the generosity of Nature to this favoured island. Bread-fruit, mangoes, limes, and other useful trees grew wild.

One industry is maintained with some vigour, that is hat and mat making by the women. The materials used in this work are the leaves of the cocoanut, sugar-cane, and "pandanus"—the latter tree, common in these islands, having strong and pliable leaves which are utilised in many ways. The hats made by these women are really works of art, displaying an immense amount of delicate labour, skill and taste, and are made in great varieties of pattern. The mats are plainly woven with smooth strips of leaf, (some of which are dyed red,) and are largely used for flooring the huts, giving the latter a neat and clean appearance.

The interiors are scantily furnished, having little else in them besides plain wooden beds. Meals are eaten on the ground, as often outside the hut as indoors. For lighting purposes, "candle-nuts" are used, the tree growing wild all over the island. The dry nuts are strung on a leaf stalk, so that the burnt out one ignites the next below it, and the light given is sufficient for the ordinary purposes of Rarotongan domestic life, in which reading and writing form a very small part.

Our stay at Avarua was exceedingly pleasant, and it was with genuine regret that we bade farewell to the islanders, whose friendliness and simplicity had made a great impression upon us. Presents of fruit and flowers, and "home-made" hats of no small value were given to most of us on our leaving, and as we sailed away for Tahiti, we agreed that it would be long before we should forget the pleasant island of Rarotonga, fading into mist astern of us.

# THE WINTER LIFE OF ANIMALS.

BY GORDON STABLES, C.M., M.D., R.N.

HAS the reader ever been in a blizzard, or what is nearly as bad, abroad among the hills of Scotland or Cumberland, or even on the bleak bare moors of Yorkshire, when a snowstorm has suddenly come on? People who live in the southern counties of England seldom see such a thing. But when it does take place, deaths in the snow-drift are by no means rare, for those who are out in the blizzard are often entirely without any previous experience of such terrible weather; they do not know what to do, they become nervous, flurried, frightened, then sink and sleep and die. I have weathered many a snow gale in the Highlands, and must confess to having felt a certain amount of pleasure in fighting the storm; and still more in my welcome home, the brightly lighted room, the happy faces round the fire, the cosy drawn window curtains, and—the dinner. Ah! that, indeed; while after an adventure of the sort, as one draws his chair up to the table he may well say with Burns—

> "The storm without may roar and rustle,
> I dinna mind the storm a whustle."

But on nights like this, when the snow gale is at its very wildest and worst, roaring round the chimney, rattling the casement, and dashing the mingled hail and flakes against the panes—when to open the hall-door but for a moment causes a feeling of suffocation akin to that a weakly child feels under a shower-bath—then somehow my heart goes out and away to the birds and beasts of the field, that cower shelterless in corners or shiver on the naked frozen branches of trees and hedges. After such a storm I have found blackbirds and thrushes hanging by the claws on the twigs from which they had dropped dead. I have seen dead deer on the forest borders, and hares in the ditches, while rooks and even larger birds have come hopping to my door to share in the sparrows' humble meal.

The destruction of bird and beast life during severe snowstorms is far geater than most people imagine, for we seldom find the dead, they creep into holes and crannies to die.

Seven or eight years ago a snowstorm of extraordinary violence, a blizzard in all truth, raged for about twenty-four hours in the Midland and Southern counties of England. In Berkshire, the day on which it came on is still alluded to as "that terrible Tuesday." The temperature fell low and suddenly; the wind was fierce and gusty; sometimes it seemed to blow from a dozen different directions in a minute. Suffocating ice-dust, as it is called, filled the air, and abroad in the fields the strongest man could hardly have faced it and lived. We noticed the effects of this storm for at least two years afterwards, in the scarcity of those birds that stay with us all the winter, and in the subsequent slow decay of trees. These last only died in parts where they had been twisted and frozen, and not all in the same year. Some struggled on for a summer, but succumbed to the frosts of the succeeding January. Let me here say, parenthetically, that the word "ice-dust," which I have just used, seems to be of Yankee origin, and is somewhat misleading. We have long known it practically in Scotland, and during two cruises to the Arctic regions I had reason to know it only too well, but we never gave it so fine a name. It is an impalpable powder, whirled about in the air, or blown along on the wings of the gale, and is in fact composed of the wind-tossed flakes of snow, broken up as they fall, or relifted after they have reached the ground. But it is this dust, coupled with the frost and debility from want of food, that kills our wild birds and other denizens of our fields and forests.

The winter life of animals in this country is not a very enviable one, and more happy are those birds to whom nature has given the instinct to fly away and be at rest in more genial climates than ours. The migration of the feathered race is far too voluminous a subject to enter into at present. Neither is it one that naturalists know everything about. I do not think, for example, that the sight of a flock of birds making their way in some certain direction at some particular time should be taken as conclusive proof that these birds always migrate so. We want to notice them not once but a dozen times, for all animals are subject to sudden whims, owing to influences we know nothing about. So, too, are migratory fishes, though this may seem like a digression. But did the reader ever hear or read of the wonderful herring panic, that took place on the eastern or north-eastern shore of Aberdeenshire? I have the story direct from an eye-witness, and there are doubtless people living who remember it. The herring shoals appeared to have gone suddenly mad, some said they were pursued by a foul fiend in the shape of a "kraken" or sea-monster. However, they threw themselves on shore in heaps, in ridges, in myriads. There was no doing anything with the multitude of stranded living fishes, and for a whole week at least carts from all the neighbouring farms were employed carrying them away for manure, the people being naturally afraid that a plague would break out as the fish decayed.

Down where I live at present, in the sylvan depths of wooded Berks, the oncoming of winter is very gradual. Nature goes slowly to sleep, but slumbers well when her eyes are really closed. In our gardens the flowers die very hard, especially the roses; they struggle on till it is far into November, and until the first hard frost kills their beautiful buds. But many good old-fashioned flowers go to sleep singing "Resurgam," and with their buds almost ready to bloom, then these are first up in spring. Early in November the leaves come earthward in showers from our deciduous

MOUNTAINEERS SEEKING SHELTER FROM A COMING SNOWSTORM

trees, and in much the same fashion year after year. First comes a day or two of soaking rain, then towards evening the sky gets bright and clear, and all night long the stars shine like diamonds, and many a long-tailed meteor goes flashing across the firmament or descends like an inverted rocket. Next morning the air is bracing, the ground is hard as flint, but there is neither breath nor motion, only a little whispering high up among the tips of the weird and stately poplars. Never a hush till sunset, perhaps, when the wind begins to moan and the trees give voice; they are singing their last song, for in less than forty-eight hours they are leafless and bare—with the exception of the oak, ash, and acacia; but the limes, elms, and gaily-tinted sycamores, that in summer were bee-haunted cloudlands of green, are now a mere network of twigs and branches, looking as hard and dark as if traced in ink.

We miss, now, many of our creeping or crawling garden favourites. The wasps that buzzed around me in autumn, and wanted to drink my red ink, who threatened to sting but never did, who carried away armfuls of my best plums and greengages, flies and caterpillars, and even the dogs' food, are all gone, dead or lethargic. Their representatives will come prospecting round in spring again, however. My gallant friends the stag-beetles have hid themselves deep down in the ground in the neighbourhood of old wood. The earwigs that swarmed two months ago, and are so great a plague, have gone to sleep in their cracks and blue-bottles in crevices. On a mild day moths and midges, or gnats, still flutter out. There is neither song nor poison in the latter now, and towards evening they seem to feel sorry they were ever born.

My sly "pawky" old toad has worked himself, stern foremost, far in under the green bank on which my garden wigwam stands, and here he will dream away the winter. In beneath the wooden floor of this wigwam sleeps also a hedgehog. He rolled himself in leaves first till every spike had half a dozen on it, then sunk himself among the earth and roots of the wild convolvulus. When days get long once more, and the primroses are in bloom, he will come creeping out, shivery, weak, and as lank as a weasel. In the gnarled old apple-tree yonder a dormouse has made his winter's bed, and none knows he is there but I.

While early winter is yet green the earthworms have a bad time of it in my gardens. They may be seen at any time hurrying up out of their holes in the path, and well they may, for some vicious tiger-looking larvæ have seized them by the tails, if I may so speak, and are eating them alive. They usually get diseased and die after this, or attempt a little migration, get caught in a shower, and succumb.

Where are the frogs that hopped about so merrily when summer days were fine, that used to stalk the flies so nimbly, so gracefully; that my little ones used to catch and kiss, or hold miniature race meetings with, or bring to me to be healed when they got in the way of John's scythe in the paddock, and were grievously wounded? They are asleep in knots and in bundles in the muddy bottom of the pond, or under the long green weeds in the still waters of the mill-dam.

Bats are always summer favourites with us down here. They wait at home in their caves, or under bridges, until the swifts and martins have quite done wheeling and singing in the air, then they come forth, but so swiftly do they fly, that, if your sight is not of the best, you may easily mistake them for swallows. They skim across the ponds like these latter, and like them, too, they first eat a fly, then, without alighting, sip a drop of water to wash it down. They come into our bedrooms at night, if a light is burning, and after flying around the room till exhausted, alight and patter about the floor. When the light is extinguished they mount a chair, and, spying the stars, fly away through the open window towards these. But they have gone to their winter's rest long ago, hanging in bunches head downwards, and wrapped round with their wings, like a Highlander in his plaid, and in their caves they will sleep till spring-time returns.

Spiders are exceedingly lively and energetic in the early days of November, but when the frosts of winter come they seek for shelter, curl their legs under them, and go to sleep—perchance to die. Household flies sleep in winter on very cold days, but come out in fine weather and take pot-luck with the family.

Our field-mice make themselves very cosy wee nests for winter. Who does not remember the words of our tender-hearted poet, Burns, on turning up the mouse's nest with the ploughshare?—

> "Thou saw the fields laid bare and waste,
> An' weary winter comin' fast,
> An' cozie here beneath the blast
> Thou thought to dwell;
> Till crash the cruel ploughshare past
> Out through thy cell.'

But it is time to say a word about the birds. The spirit of wanton destructiveness is not yet extinct. But the Wild Bird Act has done a little good, yet not so much as might have been expected. There is a close season for many of our beautiful feathered friends, it is true; but Tom, Dick, and Harry, towards the end of it, are counting the very hours, and it is hardly finished ere they are down like the wolf on the fold to maim and to murder. Again, almost every evening all the winter through, wretched, brainless boys are out around the hedges and the ivy with lamp and clap-net, and every sheltering bird is ruthlessly captured and killed right out, or reserved for gunning-matches.

This is not all yet, and the upper classes are no less guilty than the juvenile lower. Larks upon toast! So long as this is a favourite addition to our *menu*, so long will these charming song-birds be caught in thousands throughout the length and breadth of the land, and we shall soon have to go to very desolate places indeed if we wish to be charmed with the skylark's delightful music; or that of the woodlark, who often on sultry nights of summer sings among the clouds all the livelong night.

Well, now that winter has come we miss many birds that we were wont to see and hear in summer. The swallows, *et id genus omne*, have gone long ago. Our very last nests were hatched in October; after that we watched them while in training wheeling round and round in the sky, feeding the young while on wing, and every now and then alighting on the telegraph wires in myriads. No, I do not think that the swallows hybernate in caves of the hills. Some few may, but these are the sick and the delicate, and instances are not unknown of nests of young having been entirely clayed up by the parents, the young sinking into lethargy and sleeping through all the weary winter.

The rooks never leave us, though sometimes they are hardly pushed. They sleep in the forest lands and woods, but their favourite feeding-grounds are the fields and banks along the side of the Thames and smaller rivers.

In green winters we often have the lapwings in flocks till green leaves come again. They get plenty to eat among the mangolds and turnips. Sometimes I have noticed three different army corps in our field, each under the command of a leader. In the air it is wonderful how these can mix and mingle and get clear again, each bird doubtless keeping staunch and true to his own regiment.

It is well on in December while I write, the thrush is still in song, however, and he will sing away till the snow falls. But not even the snow will check the sweet notes of our beautiful robins. Singular to say, our robins come to be fed every day all the summer as well as winter, and bid defiance to our large army of Persian cats. The sparrows, like the poor, are always with us. The cocks make marital arrangements even now, though building or breeding does not commence till February. One particular sparrow sits with his *two* hens all night on a twig under the verandah.

Talking of winter, Burns says—

> "Ilk hopping bird, wee helpless thing!
> That in the merry months o' spring
> Delighted me to hear thee sing—
> What comes o' thee?
> Where wilt thou cower thy chittering wing
> An' close thy e'e?"

Well, the sparrows, at all events, have studied the science of hygiene to some purpose. They know well how to take care of themselves in winter, and to this fact with others I attribute their great increase in this and in other countries. Here with me they nestle among the ivy that clads the poplars, always on the lee side, they also fill their summer nests, make common lodging-houses of them, huddling together for warmth, and they build shelters that are not nests in the Wisteria trees and among the Gloire de Dijon bushes that trail over the stable walls.

Many of our blackbirds go away in winter, but a few always remain, and build about the same places every year. They build early in February, and we notice that they do not sing until the nest is completed, their rule being business first, pleasure afterwards. Wild geese, swans, ducks, etc., sometimes pass overhead in winter on their way to water, and quite a number of birds may be found about springs and ponds that do not freeze over, for here they can pick up food—notably the wagtail family—and in our copses we have wrens.

The starlings do not very often come to be fed; they prefer living with the rooks or with the sheep, which they keep clean as monkeys keep each other.

I must say that our birds are somewhat improvident. When no frost has occurred there are plenty of insects; yet they will eat all the hips or fruit of the wild briers, and commence upon the holly berries, wasting more than they eat. We feed them daily in severe weather, morning and evening. Most kind-hearted people do so, but they should do something more; let them, during snow, in their country rambles take a pocketful of crumbs and scatter them for the wild birds that never leave the woods or copses, or strew them near springs.

The snow seldom fills up the foot of a hedge, and here and beneath trees woodland birds find many a delicious tit-bit even when the wildest wintry winds are blowing. But nevertheless we cannot be too mindful or too kind to those shivering songsters that in the sweet spring-time fill our woods with music and our hearts with joy.

Our illustration depicts quite a multitude of wild and semi-wild mountaineers seeking shelter from a coming storm. If those Highland bulls will only admit them the deer will be cosy enough for a time; the sheep will force their way between their legs, and even that white hare and ptarmigan will find a corner. But, alas! as with our human shelters, hundreds will be turned away from the door.

The sheep will be buried perhaps for weeks, and finally dug out, living, trembling skeletons.

Not nearly enough of those shelters are built either in the Highlands or with us in England, and although in hard winters the deer are fed, they seldom get more than barely keeps the heart fluttering. What else have they to live upon? They scrape away the snow where not too deep and find frozen herbage beneath it, and they even eat the bark of the trees.

To come a little nearer home, let me conclude by saying that even our domestic creatures, such as dogs and fowls, are often too little thought about in winter. Dogs should never be left out of doors during severe snow-storms, they ought to have a warm dry bed either indoors or in an outhouse, and plenty of food and water. The pitiful howling we often hear of a night comes only too often from dogs who are starving of cold and thirst, the water-dish being frozen.

It is the same with fowls, snow sifting in through the crannies of their houses, their toes getting almost frozen to their perches, and their water frozen in the pans. Yet their owners wonder why they get no eggs!

Considering, then, all the hardships they have to endure, I think we cannot be too kind to God's creatures in winter.

# NOTES ON CURRENT SCIENCE, INVENTION, AND DISCOVERY.

## THE MOLECULAR THEORY AND INDUSTRIAL SCIENCE.

THE hypothesis of the molecular constitution of the matter, stuff, or substance which makes up the sensible material world around us, has claims to-day on average readers which could hardly have been urged a few years since. It may safely be said that the subject has now entered into the domain of industrial physics, as will be readily acknowledged by those who keep even a casual watch upon the manufacturing industries of the day, and the journals read by the workmen employed therein. The molecular theory is no longer a notion of philosophical students, or confined to the pioneers of scientific thought and speculation. The progress of metallurgical industry and of the science of engineering materials has made necessary a more exact and intimate knowledge of the properties of those materials, their powers of endurance, and their internal structure. In blast furnaces, rolling mills, and our great iron and steel industries wherever carried on, a new and larger interest is taken in questions which have hitherto been left in the hands of the chemist and the physicist.[1] A few elementary notes setting forth some of the later illustrations of an exceedingly difficult but fascinating subject may be of use to the general reader. So grand a cosmical theory, refined as it has been in late years by the labours of Clausins, Clerk Maxwell, Tait, and Thomson, until it now takes rank with the Newtonian theory of gravitation, can hardly fail to enrich and ennoble our mental conceptions as well as to advance material well-being.

The molecular theory, as it is somewhat elliptically called, is one of the many tenets of modern science which require us flatly to disbelieve the evidence of our senses. It undoubtedly asks us to reject the testimony of our own eyes and to fall back upon those higher faculties of mental investigation which control, regulate, and supplement the agency of the physical organs of sight. Demands like these need not astonish us when we remember that they began when Galileo publicly denied that the sun moved round the earth, and they have gone on increasing with every century's progress in scientific discovery. To-day this distrust of the uncorroborated testimony of our senses has been transferred from telescopic to microscopic objects, from the macrocosm to the microcosm, from the grander objects of the universe to the most minute, from the domain of molar to that of molecular physics. It is true that the minute and microscopically small in Nature is being followed up with wonderful skill and success by improvements in the "armed eye of science"; whilst astonishing mechanical feats are achieved in the subdivision and manipulation of material substances, of which Nobert's mechanically-ruled gratings with 112,000 lines to the inch and the splitting up of metallic gold into films of exactly the same fineness (just half the wave-length of violet) are examples. Yet the same microscope which can successfully partition a wave of light is utterly useless for the inquiry we have under consideration: it takes us hardly an appreciable distance on the path which leads to an estimate of the size of the visible molecule.

It is, in fact, fully recognised that the ultimate particles of the matter, stuff, or substance which make up the sensible and material world, though by no means inconceivably minute, are and will continue to be hopelessly beyond direct visual observation. Notwithstanding, from the point of view of the science of to-day, the conclusion is arrived at that the sight of those particles utterly revolutionises our old conceptions of material structure, and compels us to abandon our notions of solidity in matter. Instead of appearing compacted together in a fixed position they are revealed as to a certain extent independent of and isolated from one another. Moreover, instead of their being at rest, they would be seen in a state of perpetual motion. Whether in wood, stone, or metal—which have to be cut, sawn, broken, or otherwise violently treated to destroy their cohesion and break them visibly asunder—these particles would be seen in a state of individual freedom, with a motion of rotation, oscillation, or revolution within a determinable space.

Professor Mendeleef, the great Russian chemist, illustrates our subject by drawing an analogy between the constitution of the stellar universe and that of matter as we know it on the earth. Examined from a sufficient distance, the planetary system itself would appear as a concrete whole, and not, as we see it, composed of separate bodies. But as a matter of fact each planet and each satellite is instinct with motions which there is good reason to believe extend to the ultimate atoms of which they are composed; and, moreover, these motions may even exist, as Professor Tait has suggested, in the atoms themselves.

Let us now take another point of view. At a recent *soirée* of the Chemical Society of Great Britain, the amenities of the tea-table were pleasantly varied with an apt illustration of our subject. A piece of white lump sugar was submitted by an inquiring undergraduate to an eminent professor of physics as being in itself a simple, easy, and conclusive refutation of the molecular theory, so obviously were the constituent particles in contact. The professor at once denied the assumption; not one of the molecules of the "solid" lump before him was really touching another; all were separate, and we were looking at a discrete

[1] The Presidential Address to the Mechanical Science Section of the Newcastle Meeting of the British Association in September last by Mr. William Anderson, M. Inst. C.E., will be found to be full of instruction as to the newer attitude of industrial science to the molecular theory, as well of illustrative facts drawn from our manufacturing processes. Some of the newer statistical and quantitative data quoted in this article are taken from Mr. Anderson's paper.

mass. According to this theory, there is no such thing as a "solid" known to science. Neither the coldest iron nor the hardest granite is truly solid; like the lump of sugar, each consists simply of discrete disjunctive particles. Each body or mass is really porous; other material substances can and do pass through them, just as truly as a man may pass through a crowd of people without touching any of them, and emerge on the other side. Such was the dictum laid down by the professor; such tenets have now become the commonplaces of the men of science of to-day.

Let us now look at the nature of the evidence by which so revolutionary a theory is supported, and consider briefly some of the leading facts which are adduced as illustrations or proofs.

In the case put by Professor Mendeleef, we are asked to note the motion of a group of stellar bodies which at a distance might appear as a concrete whole, whilst the fact is that they are really separate from one another, and in motion; and we are then bidden to extend this generalisation to smaller objects lying apparently solid and inert on the earth's surface. If in responding to the professor's invitation, as we propose to do, we should find that metallic, stony, or other dense bodies are really not solid, but permeable, and able to take up, absorb, and find room for other matter without increase of bulk, or to permit the passage of other bodies through them, the illustration from the larger cosmos will well have served its purpose.

We may take our first illustration of the modern molecular theory from the fluids which we call gases. It was by studying the demeanour of gases and vapours that the foundation was laid for the theory which has now been extended to bodies in every stage of density. The now well-known "kinetic" theory of gases is a step so important in the way of explaining the seemingly static properties of matter, that it was scarcely possible to help anticipating in idea the arrival at a complete theory of matter in which all its properties would be seen to be merely attributes of motion. Researches from the days of Bernouilli, in the seventeenth century, down to the mathematical investigations of Krönig and Clausins, Rankine, and Clark Maxwell, have led to the establishment of the kinetic theory of gases, according to which a gas consists of free particles in quick agitation amongst themselves.

This kinetic theory of gases is an entirely modern view, and differs totally from its predecessors. A mass of gas is no longer regarded as an absolutely continuous fluid, as was commonly assumed, with no break in its continuity. It is compressible, and there is room in it for the infusion of other contents. The particles of gases, as compared with their own diameters, are widely separated from each other. Between the interstices, other gases can find room without increasing the original volume. Hence one gas will rapidly penetrate another, and blend evenly with it. Thus the pressure on the vessel containing the gas, whether it be a huge gasometer, a small glass tube, or an india-rubber bag, is due to the agitation of these particles and their impacts upon one another. Every surface in contact with a mass of gas is being constantly bombarded with the molecules: hence the pressure. The result deduced from the kinetic theory of gases agrees so remarkably with experiment, that it is now, in the words of Sir William Thomson, "accepted as a surest article of scientific faith."

The behaviour of the molecules of gases under different conditions has been the subject of an enormous amount of research and observation by minds of the highest order, and the results have been correspondingly fruitful. Indeed, the modern molecular theory of the constitution of matter was born with the kinetic theory of gases. Amongst the achievements which may be referred to are the determinations of the length of the free path of a molecule in the atmosphere and in gases confined within closed vessels; the number of impacts between the molecules per second, and even the approximate size of the molecules themselves. In high vacua, as in glass tubes from which the air has been so extremely rarefied as to exist at the pressure of only one sixteen-millionth of an atmosphere, an induction spark can actually be made to illuminate the places of the collisions, and to show the dark spaces or intervals between the successive impacts of the molecules, which constitute their mean free path.

Before leaving the subject of the molecular constitution of gases, it is all-important to the theory to notice that all known gases can now be compressed into the liquid condition. In fact, during the last twelve years, the so-called "permanent gases" have entirely disappeared from science. This result is of the greatest importance in illustrating a cardinal *datum* of the molecular theory—viz., that the various physical states of matter merge into one another by imperceptible gradations, and by the varying interstitial distances of the molecules.

Next to the gases, the liquids claim our attention. Have they, too, the interstitial molecular constitution we have seen illustrated in the gases, or do they form an absolutely compact, homogeneous, and continuous medium? It may at once be assumed that the molecules of a liquid, as compared with those of a gas, are comparatively close together, so that their free motion is impeded by frequent collision. Nevertheless, it is an induction of observation and experiment that the molecules of liquids are constantly moving about; the mass can take up and find room for other bodies without increase of volume.

Water at the freezing-point "occludes" above one and three-quarter times its own volume of carbonic oxide, and as much as 480 times its volume of hydrochloric acid, with an increase of volume in the latter case of only one-third.

Sulphuric acid absorbs as much as 600 times its bulk of methylic ether.

Liquids, then, are, in fact, more or less porous bodies, whose constituent particles are widely separated, have great freedom of action, and in many cases can find room in the interstitial spaces for volumes far exceeding their own.

Lastly, when we come to solid substances the

same phenomena appear. Solids, like liquids and gases, can take up other substances and find room for them in the interstices of their texture without increase of bulk. They "occlude" the molecules of gases in a most remarkable manner. Here are a few instances.

Platinum, the heaviest solid known, will take up five and a half times its volume of hydrogen.

Palladium will take up nearly 700 times its volume of hydrogen.

Copper will take up 60 per cent., gold 29 per cent., of hydrogen.

Silver will take up 21 per cent. its volume of hydrogen, and 75 per cent. of oxygen.

In each of these cases there is no increase of bulk as a result of the absorption of the additional molecules.

Again, the actual passage of molecules through solid bodies is illustrated in the following cases.

Red-hot iron tubes will permit the passage of gases through their substance with great readiness.

In certain cases liquids can make their way through metals, appearing on the other side. Petroleum will pass through a red-hot boiler-plate half an inch thick. Mercury, as is well known, will penetrate tin and other metals with great rapidity, completely altering their structure, their properties, and chemical compositions.

Space does not allow of the citation of numerous cases of the absorption of water by granites and greenstone, and other comparatively compact and impermeable rocks, as described by Professor Heddle. A familiar instance of the power of liquids to penetrate into the interior of hard minerals is seen in the process employed by German lapidaries for the purpose of imparting brilliant colours to agates.

In fact, the industrial science of to-day abounds with illustrations of the molecular theory. In the process of the manufacture of steel by cementation, or in case-hardening (we quote from Mr. Anderson's Presidential Address, already alluded to), the mere contact of iron with solid substances rich in carbon is sufficient to permit the latter to work into the heart of the former. In the formation of malleable cast-iron the carbon makes its way out of the castings with equal facility; it is a complete case of diffusion of solid substances through each other.

"Again, when by the agency of heat molecular motion is raised to a pitch at which incipient fluidity is obtained, the particles of two pieces brought into contact will interpenetrate or diffuse into each other; the two pieces will unite into a homogeneous whole, and we can thus grasp the full meaning of the operation known as 'welding.'"

Such are a few of the innumerable cases in which the industrial science of everyday life illustrates the molecular theory.

In this sketch we have purposely restricted ourselves to illustrations of the first great elementary postulate of our theme, namely, that there is no such thing in Nature as a solid in the old sense of the term, and that all the matter, stuff, or substance of which the sensible world around is composed — the earth's crust, the ocean, the atmosphere, and all their inhabitants—consists of particles which, however inert and compact they may look in the mass, really exist out of contact with and in a state of isolation from each other, and are moving with astonishing rapidity and freedom within a determinate space. Thus, however solid and inert a mass of stone or metal may appear to the eye, it has a comparatively roomy interior into which almost numberless molecular guests can be received. In the language of Professor Tait, there is no portion of matter whatever that is not capable of further compression.

A few instances in practical illustration of this microcosmic condition of matter have been given which the reader may perhaps choose to return to again in connection with Professor Mendeleef's analogy between the macrocosm and the microcosm as given in an earlier part of the paper.

The aspect of the subject we have chosen, fundamental as it is, by no means presents the whole of the molecular theory. For the present we leave it in this elementary stage. A subsequent paper would show why it is that the leading physicists and chemists have no hesitation in claiming the highest rank among cosmical hypotheses for this of the molecular constitution of the material world, and why it bids fair to rival in completeness and importance the Newtonian theory of gravitation itself.

### THE SCIENCE OF FLOATING ISLANDS.

Floating islands are among the marvels of antiquity, as may be seen in the classic pages of Herodotus, Seneca, and Pliny. They also figure in the writings of authors of modern date, Darwin having described them as in Lake Tagua-cagua, in Ohiti; and other writers mentioning similar phenomena near Gerdauen, in East Prussia; Lake Kolk, in Osnabruck, and elsewhere. Coming to our own country, there are the floating islets on Esthwaite Lake, in Lancashire; at Copesthorne, near Macclesfield; and lastly, the Derwentwater floating island.

The floating island, or islands, of Derwentwater, differ from all other floating islands hitherto described. For the best summary of information on the subject, science is indebted to the researches of Mr. G. J. Symons, F.R.S.[1] The differences are these: (I) All floating islands except Derwentwater are always on the surface; they are not connected with the bottom of the lake, and at some period in their history move from place to place. (II) Derwentwater islands are usually at the bottom, and float perhaps one month in four years; they are part of the bottom of the lake, and are always in one locality.

Careful examination shows that the Derwentwater floating island consists of a peaty mass several feet in thickness. It is, in fact, the highest part of a great blister-like upheaval of the peaty lake bottom. When this blister-like elevation subsides the island is submerged and disappears. The island only rises in hot weather. The immediate cause is the presence in the peat of

1 "The Floating Island in Derwentwater." Stanford, 1888.

an excess of gas. This gas may be collected by pushing an iron tube about fifteen feet long through the island, through which it rises, and may be received in a wide-mouthed bottle. It is this gas which floats and sustains the island on the surface. Recent analyses show that just as Dr. John Dalton found, seventy years ago, so now the gas consists chiefly of carburetted hydrogen, or marsh gas (identical with the fire-damp of collieries), and of azote or nitrogen. But whereas Dalton found their volumes equal, Dr. W. J. Russell to-day finds sometimes the one and sometimes the other to be in excess.

The facts thus collected have narrowed the problem to the issue, why is this Derwentwater peat the only peat that floats? The answer is to be looked for in further information of a partially geological character as regards the rocks at the bottom of the lake. Mr. Symons says, "We want to know (I) over how much of the area the base rock of the Skiddaw slates is absolutely uncovered except by water? (II) What is the area and the thickness of the clays and diatomite resting on the slates? (III) What is the area and thickness of the peat? These questions are themselves a contribution to the solution of the problem, reducing it to the simplest form, viz., What are the causes that give rise to the evolution of gas at this particular spot in the Derwentwater lake?

It may be added that the island did not rise during the present year. Its last appearance was in 1877, when it rose July 15th, sank July 24th; rose again August 12th, and continued at the surface until after September 2nd.

# Varieties.

### John Ericsson.

In the summer of 1889 passed away one of the greatest inventors the world ever saw, John Ericsson. Less notice was taken of the event than is bestowed on far smaller men. This was due partly to the modest and retiring nature of this son of genius, and partly to the fact of his having survived to an age when his works had well-nigh been forgotten, or at least been thrown into the shade by the more brilliant discoveries in recent electric inventions. He was eighty-five when he died.

A Swede by birth, he got his rank of captain of engineers by merit after seven years' service. Soon after, he emigrated, and was naturalised in the United States. It was he who by the building of the Monitor saved the honour of the American navy, and began a great revolution in naval warfare. But for the sudden apparition of the Monitor, the ironclad Merrimac might have laid every seaport in the Northern States in ashes, or levied ruinous contributions as conditions of safety. His later ship, the Dictator, led to the turret-gun ships, and the great rivalry in the art of attack and defence in ironclad vessels. He it was who first proposed to put the engine-room and propelling power below the water-line. He was the inventor of the screw propeller, though it was first put in use in England. He first constructed a wrought-iron gun, and strengthened it with bands, in which he was followed by Krupp and Armstrong. He invented the twin-screw propeller, now to be used in great Transatlantic steamers, but which he showed fifty years ago in a Thames river tug-boat. When a reward was offered in England for a locomotive that would travel at the speed of ten miles an hour. Ericsson built one that went thirty miles. Another gained the reward only because his engine pulled greater weight; freight, not passenger traffic, being then the chief source of railway revenue in England.

Engines for submarine warfare, floating forts, and other warlike inventions were made by him; but his chief delight was in contriving new forms and applications of power for industrial purposes. Some of his proposals are meant for the far future, as his "solar engine," to utilise the sun's rays as a motive power in times when coal shall become scarce and dear. On the banks of the Nile, in Upper Egypt, he dreamed of factories being erected with power many times greater than that now employed by all the manufactories of Europe!

In "Lippincott's Magazine" for July, 1889, an enthusiastic admirer has given an interesting account of his life and his works. The strangest thing is that when the great Centennial Exhibition was arranged, in 1876, Ericsson was utterly ignored and forgotten. He emerged from his retirement, and the old man printed, for private circulation, a book containing descriptions of about fifty of his inventions, some of them familiarly used, but the author unknown to the public. The opening sentence of the book was as follows: "The Commissioners of the Centennial Exhibition having omitted to invite me to exhibit the results of my labours connected with mechanics and physics, a gap in their record of material progress exceeding one-third of a century has been occasioned." This is the only utterance of disappointed feeling in the book. His first settlement in the States was in 1839. He never pushed himself forward, took no patents, lived a quiet, lonely life, and was contented to be useful to his adopted country.

In his native town there is a memorial shaft to John, and his brother, Nils Ericsson, who remained in their father's profession of mining engineer. The inscription has the words: "The way through work to knowledge and fame is open to every Swedish youth." This is good, but the Americans also ought to have some visible memorial of John Ericsson.

**The Return of Stanley.**—By general consent, as well as in his own estimation, the wonderful journey which Mr. Stanley brought to a close in the first week of last December is the most extraordinary of his African explorations. At the time we go to press, telegrams of congratulation are pouring in upon him from crowned heads, societies, and private friends; and preparations are being set on foot to give him a fitting reception when he regains our shores. Lost to sight for two years, and believed to have experienced the fate which befel many of his followers, he has emerged on the further side of the African continent unharmed and victorious, bringing with him those he was sent to rescue, and bearing news of discoveries which will be eagerly waited for by the whole civilised world. New lakes have been found, the courses of heretofore unknown rivers have been traced, and he has at last, he says, located beyond a doubt those mysterious Mountains of the Moon which for many centuries have alternately appeared upon and disappeared from the map of Africa. Until further information can be procured we can only present our readers with a portrait of the great traveller from a photograph taken shortly before his departure on his last journey. Recent telegrams say that his hair has become white.

**Opium in China.**—Dr. Edkins, the well-known missionary and scholar at Pekin, has issued a historical tractate on the history of Opium in China. The Arabs took it to the East in the eighth century, when there was a flourishing trade be

tween the ports of the Red Sea and the Persian Gulf and Canton. It was cultivated extensively in China, and its medicinal properties are described in a Chinese book of the tenth century. The smoking of opium seems to have come in during the same century as tobacco-smoking, probably early in the seventeenth century. At various times there were Imperial edicts against opium-smoking, but it was difficult to enforce them, as the habit was indulged in by court favourites and official personages. Opium has long been a common article of trade in the remote province of Yunnan, with which there was no traffic with any foreign land except Burmah. The researches of Dr. Edkins are opposed to the common opinion that opium was first introduced into China from India.

**Montyon and other Prizes of Virtue and Merit in 1889.**—The virtue prizes, eighty-six in number, were announced at the Academy, the address being delivered by Bishop Perraud, of Autun. The two chief prizes of 2,500 francs were awarded to Pierre Leopold Crouzillat, of Sables d'Olonne, Vendée, and the Abbé Brassier, of St. Georges de Reintembault, Ile et Vilaine. Crouzillat is captain of a lifeboat, and has rescued more than forty crews, French, English, German, and Norwegian. He has also saved two lives from fire. He believes that Providence specially protects those who thus risk their lives in saving others. The Abbé Brassier served as military chaplain during the siege of Paris, and was repeatedly under fire. He now carries on an orphanage, with fifty inmates. Among the literary prizes were 2,000 francs to M. Georges Lyon for his "Idéalisme en Angleterre au XVIII Siècle," 2,000 francs to M. Bonvalot for the account of his Central Asia explorations, accompanied by Prince Henry of Orleans; 400 francs to M. Auguste Monod for his translation of J. R. Green's "English History"; 400 francs to M. de Varigny for his translation of Darwin's Life; 1,000 francs to Mr. Marion Crawford; and 1,000 francs to Madame Dronsart for biographical essays on eminent Englishwomen.

**Fruiterers' Company.**—The late Lord Mayor Whitehead was admitted to the freedom of the livery of the Company of Fruiterers in acknowledgment of his zealous advocacy of fruit-growing in England. The Lord Mayor, in thanking the Company for the honour, said it was his firm belief that fruit farming and the cultivation of orchards might be profitably revived throughout the country, and that instead of importing so much of our fruit from foreign countries it might be grown here with profit to the farmer and with advantage to the public. At all events, he would spare no effort, both now and when he left office, in throwing his heart into making the movement a success.

**Demand for Paper.**—"The Stationery Trades' Journal" (published by Whitaker, of the Almanack) says that all paper mills are now at full work, having as many orders as they will be able to execute for months ahead. The demand is not only for cheap sorts of writing and printing paper, but for better class papers, both machine and hand-made. The same journal states that "General" Booth and the "Salvation Army" consume an average of above twenty-six tons weekly for their papers, posters, and other printed matter. The circulation of the "War Cry" is given at 277,000 weekly, and of the "Young Soldier" nearly 200,000. A very large proportion of this sale is due to the zealous colportage efforts of distributors. The managers have acquired the patent rights of a new printing press, turning out 10,000 copies an hour, and capable of printing six colours simultaneously.

**The Solomon Islands.**—In the "Australian Star," a Sydney paper, Captain Drevar (whose life-saving inventions may be remembered at the Fisheries' Exhibition in London) gives a long account of a visit, in a schooner, to the Solomon Islands. He gives an account of scenes of violence, probably caused by "labour agents" seeking to kidnap natives for the Queensland plantations. Of the Solomon Islands he gives a glowing description, describing them as the finest group in the Pacific, seven islands, averaging 100 miles in length and 30 in breadth, with numerous smaller islands, and deep water around them all. He concludes by calling on the New South Wales Government (why not the British Government?) to take possession before the islands fall into worse hands. "New South Wales has a good claim now; her citizens have done nearly all the little commerce that has been done with them; her sons have been murdered in cold blood and there is no redress. Some German or French subject may get slain, and the rulers of these nations may seize the opportunity. As the natives have no hard cash to give as indemnity, or no recognised ruler to give satisfactory terms, their whole country may be seized. And, rave and talk as we may, the opportunity lost can never be recalled, though it may never cease to be regretted."

**Financial Success of the Paris Exhibition.**—The Exhibition accounts show 49,000,000 francs receipts, and 41,000,000 expenses, leaving a surplus of 8,000,000; whereas in 1878 there was a deficit of 31,000,000, and in 1867 a surplus of 4,000,000. It should, however, be added that the so-called receipts include a subsidy of 18,000,000 francs from the State and 7,000,000 from the city. Wonderful stories are told of the gains made by the restaurants and by various contractors during the season.

**"Mr. Pips, his Diary."**—By the death of Mr. Percival Leigh, last autumn, journalism lost one of its oldest representatives. The author of "Mr. Pips, his Diary," of the "Comic Latin Grammar," and the "Comic English Grammar," belonged to an earlier generation. The friend and collaborator of Leach and the Mayhews, of Thackeray and Jerrold, of Dickens, of Albert Smith, who took a close and active part in many, if not all, of the literary periodicals of the time, his chief title to recollection is his long labour in the service of "Punch." That service began almost with the beginning of the journal, and continued till his death at the age of nearly 77. There is, perhaps, only one other literary man who assisted at the beginning of "Punch," and not one artist; but the engraver who engraved the wood-blocks of the first number, and who has had personal intercourse with all the artists and the successive editors, still enjoys a green old age, Mr. Swaine, of Bouverie Street, Fleet Street.

**New Zealand.**—From the last report issued by the Canterbury Chamber of Commerce, it appears that New Zealand is beginning to share in the renewed prosperity of the British Empire. The exports of the colony for the year ending June, 1889, were valued at just under nine millions sterling, which is an increase of 1¾ millions on 1887-8, and nearly two millions over the record of any previous year. This gratifying result is due not merely to increased values, but to greater production. Wool, wheat, oats, barley, frozen meat, coal, and timber all show increases. While the total exports have increased, the imports have receded somewhat. The imports were valued at just under six millions sterling, a decline of £304,000. This is said to be due chiefly to the reduction in expenditure on material for public works. Increased immigration is wanted.

**A French Heroine.**—Sister Marie Thérèse, superior of the Sisters of Charity now serving in Tonquin, may be styled the Florence Nightingale of France. She was recently decorated by the General commanding the troops in Tonquin, who gave some particulars of her remarkable career. When she was hardly twenty-five she was wounded at Balaclava. At Magenta she again received a wound in the forefront of the French army. She accompanied French soldiers to Syria, China, and Mexico. In the Franco-German war she was grievously wounded at Reichshofen while attending the cuirassiers who fell in that memorable charge. At a later stage of the same campaign she distinguished herself by seizing a bomb which fell into an ambulance, and carrying it away eighty yards, when it burst, seriously injuring her alone. She was scarcely recovered from the effects of this injury when she volunteered for service in Tonquin, where she is still engaged in her noble work.

**Oxford and its Professors.**—An article in the "Edinburgh Review" for October, 1889, on professorial teaching at Oxford, has caused no little surprise to those who are interested in University education. A list is given of fourteen professors with aggregate incomes of £8,500, who give lectures to

classes the whole of which combined are smaller than one average class at a Scottish or German University. Some of the professors give no lectures at all; others have from five to fifteen hearers, more usually ladies than undergraduates. The only classes with any number of listeners are those of theological professors, because some of the bishops require attendance from candidates for ordination. The total expenditure on the professorial body is nearly £50,660 yearly; and the "Edinburgh Review" asks whether the amusement of idlers in Oxford is a justifiable use of endowment so large. The professors ought to be men qualified for lecturing tours all over England. There is little likelihood of improvement without Government interference, as the professorial system, so far as Oxford is concerned, is unpopular with most of the resident Fellows of Colleges. It is high time for the appointment of another Uuiversity Commission.

**A Good Wish from Mr. Gladstone.**—The American journal "Science" publishes the facsimile of the following letter from Mr. Gladstone, dated September 13th, 1889, written in response to a copy of "Science" sent to him, containing General M. C. Meigs's article on "The United States—their growth in population in two hundred years":—"Dear Sir,—Your estimate, the boldest I have seen, is full of interest. Evidently there is to be a vast development of material power in the world, and most of all in America. May we hope that moral power is to keep pace with it, that there may be a corresponding growth in the sentiments of humility and reverence towards the Giver of every good and perfect gift.—Your faithful and obedient, W. E. GLADSTONE."

**Dr. Joule.**—In proposing, at the Council of the Royal Society, the foundation of a suitable memorial to the late Dr. Joule, Sir Henry Roscoe said, "It is only proper that the Royal Society, representing as it does British science at once in its highest and widest forms, should take the initiative in promoting the national recognition of one whose services to science and to mankind are conceded by all scientific men to be only second to those rendered by Newton himself." We fear that many people who associate "science" chiefly with the vague and theoretical controversies about "evolution" and the origin of species, are not aware of the services which make Joule to be spoken of as second only to Newton himself, a place which some have given to Darwin. To James Prescott Joule we owe the demonstration of the relations of heat and of electric action to mechanical power, a discovery applied to many practical uses. He received all the honours and medals which scientific and learned societies could bestow.

**Light on Old Testament from Cuneiform Tablets.**—The Assyrians kept a strict chronological register by means of certain officers called "limmi," or "eponymes." The eponymes are changed every year, the years being named after the several eponymes who presided over the lists. These eponymes have been discovered, and consequently a continuous chronological table exists which extends from the tenth to the middle of the seventh century B.C. The date of a king's accession is always recorded, and in some of the lists the principal events that marked the years are mentioned. As the Assyrian kings were careful to give the names of the eponymes who presided over the different years in which the events they record took place, we now determine exactly not only the date of the accession of a Tiglath-pileser or the death of an Esar-haddon, but also the year in which Sennacherib invaded Judah, or Menahem of Samaria paid tribute to the Assyrian lord. The conquest of Judah by Sargon is another instance of the unexpected light which the Assyrian inscriptions have cast upon the pages of the Old Testament.—*Life and Times of Isaiah, by Professor Sayce.*

**The Prince of Wales and the Khedive.**—The special correspondent of the "Times" thus referred to an incident which gave great pleasure to the Khedive, and to the Egyptian people, when the Prince of Wales was in Egypt last autumn. "The review of the British and Egyptian troops at Abbassieh afforded his Royal Highness an opportunity of performing a graceful act of courtesy to his host, which elicited the warmest thanks of the Khedive and the hardly suppressed enthusiasm of the crowd of spectators of all nationalities. The troops had been inspected, had marched past in three different formations, saluting the British and Egyptian standards, and were drawn up in line facing the Khedive and his royal guest, when the Prince was observed to speak a few words to his host and, riding across the intervening space, to take command. Placing himself at the head of the British regiments, the Prince drew his sword, gave the order to 'Advance in review order," and, followed by the whole line at quick march, he advanced to within a short distance of the Khedive, giving the Royal salute, while the massed British bands played the Khedivial Hymn. The Khedive, to whom the incident was entirely a surprise, was visibly affected. Advancing to meet the Prince, the two shook hands so warmly as to preclude any idea of mere conventional courtesy, and amidst the salvoes of artillery the pair rode off the field. The French papers assure us that the visit of the Prince of Wales will not affect the solution of the Egyptian question; they perhaps omitted to add that it will have no appreciable influence on the rise and fall of the Nile."

**Agricultural Shows in India.**—The Directors of the Agricultural Department in the Madras Presidency have hit upon a sensible and useful kind of agricultural show. Here in England it has been of great service to have agricultural meetings at different centres each year, for diffusing knowledge and spreading interest in farming. In India there is a dead stagnation in agriculture, the peasants, or ryots, plodding from generation to generation on their old systems and with the clumsiest of implements. The Madras Government has sent an itinerating show to many districts, and the natives are made to see with their own eyes the light ploughs and other implements which would lessen labour and increase the produce of the soil if used by them. They are shown also the kinds of artificial manure best for different soils, and get other practical lessons in agriculture. Something of the same kind of teaching has been attempted in Ireland, where it is as much needed as in India.

**American World's Fair in 1892.**—The nations of the Old World are to be invited to a show which will equal if not surpass that of Paris in 1889, the occasion being the celebration of the discovery of the New World by Columbus in 1492. There are wonderful sights in New York, but there are also disgraceful sights for a city of such magnitude and wealth. The quays and wharves are as bad as those of Melbourne were in primitive times of Australia. The streets are in many parts badly paved, and there are "slums" such as one could hardly expect to see in a city so modern. A good deal of "cleaning up" and preparation will be needful, not only in the Irish quarters, but in other sections, if a fair view is to be presented to strangers from Europe. The Centennial Exhibition at Philadelphia was a grand success, and so will this semi-millennial show be at New York if the authorities begin to bestir themselves for the Old World's reception.

**Limited Liability Companies.**—The practice by private firms of turning their businesses into limitied liability companies has increased to a wonderful extent in the course of the last three or four years. Scarcely a week passes which does not see some well-known house reconstitute itself in this way. We wonder whether the creditors of such houses ever give serious consideration to the change in their position which is effected by the addition of the little word "(Limited)" to the style of Smith and Son or Brown Brothers! We have not the slightest inclination to contemplate cases of downright fraud, which are rare and capable of being dealt with by law. What we wish to point out is, that when a business is converted into a limited company the security of its creditors may often be seriously diminished.—*Stationery Trade Journal.*

**Anti-slavery Conference at Brussels.**—It is no small honour to Belgium that the capital of one of the younger and less powerful of European States should have been chosen as the place of meeting of the Anti-slavery Conference. No such assemblage of eminent men from all lands has been seen for a long period, and it is hoped that great moral results will follow the deliberations held at Brussels, under the sanction of the King of the Belgians, who takes so enlightened an interest

in Africa. The conference holds its meeting in the Belgian Foreign Office. The opening address was by Prince Chimay, the Belgian Secretary for Foreign Affairs. Reply was made by the Dutch Minister as *doyen* of the diplomatic body, which includes ambassadors from almost every European State. The presidency of the conference was then formally assumed by Baron Lambermont, Belgian Minister of State. The King gave a special audience to the British delegates, and courteously expressed his gratification at the support of England, where so much had been done in this great cause. He also expressed regret at the unavoidable absence of Mr. Sturge, the venerable president of the British and Foreign Anti-slavery Society.

**Irish Home Industries.**—One of the School Inspectors of Ireland says: "For six months of the year the Irish peasant is idle. Could not work be provided for him during that time at home? Could not the men weave baskets, carve bog oak and serpentine, make straw bottle-wrappers; the women, in addition to these, weave cloth, knit stockings, make articles of female attire, keep bees and poultry, plait straw hats, work embroidery and lace? Cannot these occupations, which already exist, be spread over the country? The wicker baskets in use in this country are mostly brought from France; they should all be made at home; osiers . . . will grow along our bogs and rivers; basket-making is easy to learn, and a worker can earn at it a pound a week; osiers, too, can be worked up into chairs, tables, and other useful articles. A hundred thousand pounds' worth of straw bottle-envelopes is yearly brought to Ireland from France; . . . they should all be made in Ireland. Straw-plaiting, which used to be done in Ireland, is now scarcely done at all."

**Lord John Russell in Caricature.**—The place held by Lord John Russell in caricature, which is, in fact, one of the most popular forms of contemporary history, shows how soon and how long his individuality figured in public view as one of the foremost men of his time. Long before "Punch" began his records, the pictures of little Lord John were familiar. From the first his diminutive stature was seized as a notable characteristic, as when Doyle presented him as Hop o' my Thumb in the "Faggot Cutter and his Sons," or the very small lamb beside big O'Connell as the wolf in sheep's clothing, or as the wolf coming to Little Red Riding Hood. The same use of boyishness and smallness gave force to some of the most telling of the cartoons in "Punch," as when the little boy chalked "No Popery" on the wall, and then in fear ran away; or in the page boy who was told he was too small for the place; or the nursemaid unable to wheel the perambulator with the baby Reform Bill up the steps of the House of Lords. Many of the pictures showed him in less juvenile or humble position, as when the hansom cab driver looks down with amused contempt on the Jew lad with his bag, who asks the way to Downing Street, and "Dizzy" is told that for him it is a long way round. Always, even in the boy-like portraits, there is a shrewdness and humour, such as would belong to "an old head on young shoulders." So numerous are the caricatures in which Lord John occupies the central place, that the series would almost form a complete though comic biography and history of English political life for half a century.

### Richard Cromwell's Descendants.

We have received the following communication in consequence of the statement in "Leisure Hour" for August, 1889, that Mr. Clark, late head master of Derby School, claimed to be the last lineal descendant of Oliver Cromwell, the Protector, tracing descent from Richard Cromwell.

Our correspondent says: "We have letters from Richard Cromwell signed by various names in later years—Clark, Cranbourne, Richardson, etc.—as he feared to cause danger and difficulty to himself and to others if he were identified with Oliver Cromwell's name.

"I do not see how Mr. Clark can have derived his name direct from Richard Cromwell, *alias* Clark, for the tradition in my family has always been that he left daughters, but no sons. His only son who lived to man's estate died unmarried in 1705. The family are always entered in the parish register at Hursley as Cromwells. (See 'Noble,' vol. i.)

"My mother's father, Oliver Cromwell, was the last male tracing his descent in direct line from Henry Cromwell, Lord Lieutenant of Ireland, the Protector's second son. The line is as follows: Oliver Cromwell, Lord Protector; Henry Cromwell, Lord-Lieutenant of Ireland; Henry Cromwell, major; Thomas Cromwell, London merchant; Oliver Cromwell, solicitor, of Brantingshaye, or Cheshunt Park, and lord of the manor of Theobalds, in Hertfordshire.

"The latter died in 1821, bearing only a daughter, Elizabeth Oliveria (whose name he originated as feminine of Oliver), from whom there are many descendants.

"ELIZABETH OLIVERIA PRESCOTT."

### A Shakespearian Acrostic.

IN PRAISE OF ——.

All hearts by her were swayed,
Half eager, half afraid,
To win her favouring glance "whom all commend."
Bound by restriction strange,
No living hand could change,
It brought the one true lover in the end.

I.

No more potent charm he(1) wrought,
Who by sore mishap was brought,
Far from friends and princely state
To an island desolate,
Where within his wizard's cell
Wove he many a wondrous spell,
Summoning at his desire
Sprites of water, air, and fire;
But her eyes' sweet influence
Subtler magic could dispense;
And a brighter gold than ever
Crowned an alchemist's endeavour
From her tresses one might sever.

II.

She all hearts could overthrow
Easily as, with twist of toe,
He(2) could floor his athlete foe—
Who, before a Court competing,
Boldly the duke's wrestler meeting,
Strove, his huge opponent beating;
While the glance of one fair face
Shed a glamour o'er the place—
His whole soul and thews to brace.

III.

Riches did become her well
As the pretty forest gear
Her (3) whom glade and leafy dell
Saw in brave disguise appear;
When, with one true friend, she roved
Through green Arden's lawless ways,
Seeking far for him she loved,
Parted from her longing gaze.

IV.

Hard the quaint proviso seemed.
Why had love so idly schemed?
With such blind laws hedged about,
From the world she felt shut out,
Harshly as ingratitude
Did that hapless wight (4) exclude,
When, his vast possessions spent,
To his feasted friends he went
And the lips that o'er and o'er
Came to taste his goodly store,
Coolly cursed him from the door

v.

Till her true-love should appear
By her dead sire's word she stayed.
Passion fired her not, nor fear
From her calm resolve betrayed;
Not more constant she (5) who proved
Steadfast in temptation's hour,
By a brother's tears unmoved,
And the lures of thronèd power.

VI.

But when trust and patience brought
The prizè by such quaint method sought,
Then, from cold restraint set free,
Joy gave voice to Love, and he
Filled with sweeter sounds the air
Than that vassal spirit rare (6),
Who, upon an island shore,
Piped a prince's steps before.

The initials of the six characters described in the verses form the name of the subject of the opening lines. All the characters belong to Shakespeare's plays.

# Household Queries.

**Dumb-Bells.**—*Do you recommend dumb-bells for home use, or can you suggest any good system of home gymnastics?*—The systematic use of *light* dumb-bells (from 1 lb. to 2 lbs.) has the most beneficial effect, especially where there is any predisposition to consumption. Heavy bells are exhausting and injurious to all but strong men. The weak point is, that such home exercises are apt to be felt dull and spiritless, and hence it is that all systematic gymnastics are usually found so much more beneficial in classes. They are *enjoyed* more, and hence do so much more good. If a large bare room is available, there is little better exercise than battledore and shuttlecock, which *may* be played as sharp and lively as tennis, and so as to help a great deal to get and keep the eye and hand in for that game. The next most agreeable exercise is probably the trapeze or single-bar swing, which is available for plain swinging by way of change, but will give any amount of arm exercise as well.

**Dressing Rabbit-skins.**—*Which is the best and easiest method of cleansing and preparing rabbit-skins for using them as doormats, etc.?*—Of various processes the most suitable for home use are the following: (*a*) Tack the skin, fleshy side outwards, on a clean board, straining rather tightly, and clear off all bits of fat or fleshy matter. Then rub in well either cayenne or black pepper, after which, with a brush, lay on some methylated spirit. Repeat twice a day for three days, and then leave till quite dry, when it may be removed from the board. (*b*) Tack the skin out in the same way, and remove all other matter as before. Then rub well and long into it powdered alum, mixed with about one fourth of powdered salt. Not much powder is needed; it is the rubbing in is the chief thing. In a day or two repeat this, and then leave in a very gentle warmth till dry, when it may be removed, and the powder knocked and shaken out. The skin will feel harsh and hard at first, but soon becomes soft. The second is, on the whole, the best process.

**Silvering Glass.**—*The silvering from the back of a pier-glass has been slightly rubbed off. Is there any way of replacing it, or substituting something that will prevent the damage being noticed?*—It is not very easy to exactly match the old silvering in colour, but silvering is easy enough. Clean off the whole place, finishing with a little spirit of wine to remove all grease, and build a little wall of wax round, a little outside. Prepare a small bottle of oil of cloves mixed with three times as much spirit of wine or alcohol. Then you may either fill the wax wall with solution of nitrate of silver in distilled water, brushing it with a clean-washed camel-hair brush over all the place so that it perfectly wets "or catches on" to it as it were, after which you drop a few drops of oil of cloves into it, each drop in a different place; or you may make your silver solution thus (Drayton's): 1oz. silver nitrate in 2oz. water and ½oz. liquid ammonia, filter, and then add 3oz. alcohol and 20 drops clear oil of cassia. After standing six hours to settle, the clear fluid is used as before. Too much oil of cloves precipitates too quickly—it should take about two hours. You might try a little of each on plain glass, and see which does best in your hands, and best matches colour of the old silver. When thick enough pour off, wash with water, dry, and varnish the back with gum damar dissolved in benzol and toughened with a little gutta-percha.

**Colours.**—*An unæsthetic housewife, with but little training, would be obliged if you could give her some idea of the harmonies of colour. She is puzzled in arranging her rooms, and is sometimes startled by the comments of candid friends.*—Do not be too much put out about the latter. A great deal of the presumed æsthetic criticisms of the day are very ignorant, and merely conventional, without much real artistic sense; and the man or woman who affects to shudder at some supposed vulgar combination, and talks as if harmony of colour was the end of existence, may know as little even of colours as of some other things. We can remember when yellow was an "ugly," vulgar, "horrid" colour. Where is that opinion now? We can remember when it was "horrible taste" to have blue and green in proximity, and the more ignorant dressmakers say so still, but real artists have learnt better from the blue sky and green grass, which God has married together all over the world. There is generally some one in a household with fair taste, and this is better than rules, which can only go a certain way. Still they may assist, and if you are really troubled over this you may get considerable help from some little manual of colour, like Professor Church's, which will enter more fully into the matter than we can here. But briefly: 1. Very *brilliant* colours are bad, as a rule, because they give no *repose* to the mind—hence the "comfortable" look of the slightly-dull tertiary tones so general in carpets and curtains. There is some reaction towards brighter colours now, but this is less safe, and "quiet" colours will always be in fashion. 2. Very violent *contrasts* are bad: such colours are often said to "swear" at one another. There is positive physiological reason for this. The rainbow colours are in a certain order—violet, indigo, blue, green, yellow, orange, red. These have such different properties that the two at the extreme ends—red and violet or blue—positively cannot be seen in focus at the same time; hence a bright blue and full red, together, give a sort of actual strain to the eye. 3. On the other hand, *a certain amount of contrast* is necessary to real harmony. Thus a thing part yellow and part orange looks very bad. Two shades of yellow might do, but orange and yellow one feels should either be nearer in colour or more different. We try red and yellow, and feel that will not do either: it is worse still. Now one rule about this is always safe. There are pairs of the colours that always make white if added together; these always look well together. Such are yellow and blue,[1] orange and blue, red and green, purple and green. Green and yellow also look well. But the pure colours, as above said, are best avoided, choosing tints toned down or diluted either with other colours or white. 4. A room should have a sort of tone about it, and not all kinds of contrasts. In a room with furniture chiefly of dark wood, and perhaps some black chairs, Austrian bent wood of *light* colour would look conspicuous and therefore bad. Water-colours, or chromo-lithographs, in their light frames, look staring and bad on a dark-coloured wall, and

[1] Yellow and blue when *added* together make *white*, not green, as popularly supposed. The green derived from mixing paints is the result of double *absorption* from the white.

oils or oleographs on a light wall. Warm colours, as a rule, suit dining-rooms best, and lighter, cheerful colours drawing-rooms. Thus, a dining-room may look well with sage-green and gold paper and sage-green table-cloth, with reddish-orange curtains, or terra-cotta. Drawing-rooms are often done with the pale, so-called "sparrow-egg" blues and greens for the paint, when papers may be still paler of the same, or pale yellows picked out with white—with such colours some blue carpets are great favourites, with white in the pattern. Yellow and white papers, with darker ivory paint, is also a nice combination. In all cases curtains may be of the same prevailing hues, or their complementaries as above. A room kept pretty quiet in colour, and mainly confined to a pair of the complementaries, with no obtrusive display of another set of colours, can never look really bad, but with pale sparrow-egg tints, or subdued tertiaries, full and brilliant pure colours are offensive by contrast.

**Better Dinners.**—*Can you suggest any plan by which middle class families might be more easily provided with varied dinners? Could not something in the style of the soup kitchens be set on foot for us poor wives and children who cannot afford a cook?*—This is hardly a subject to be dealt with here. Some such project has been proposed more than once in daily papers, but all English habits and manners are against it. Why, however, give up and talk of "poor wives who cannot afford a cook"? Any wife with decent health ought to know or learn enough to teach her one servant sufficient for all reasonable necessities. For the most ignorant there are now published real lessons in cooking, as well as mere catalogues of *recipes*, and no woman worthy to be a wife should neglect to master sufficient to perform what is as distinctly her duty, under the circumstances, as the bread-winning is that of her husband.

**Typhoid Fever.**—*Typhoid fever is prevalent. Can you tell me from what it springs? In what degree is it contagious?*—There is practically no doubt that typhoid fever germs are spread through the fæcal discharges of patients, and have to be *swallowed* in some way, either through contaminated water or milk, or very probably by breathing sewer-gas so contaminated. Many cases have been traced to particular wells, or to the milk from particular farms where cases have occurred. Typhoid fever is not contagious in the ordinary sense at all, and is not, as commonly supposed, at all identical with typhus, which is dangerously so. You may sit all day by a typhoid patient with really no risk, and in hospitals typhoid cases are not isolated. It is the discharges which have to be looked to; and, with outbreaks around, the water and the milk (boiling kills the germs), and the state of the drains.

**Basement**—*In a house built on clay soil, is it best during the damp winter months to shut up the basement to prevent the entrance of damp air, or should a current of air be uniformly allowed to pass throughout the year?*—Keep aired and in use by all means. Stagnation can never do anything but harm.

**Cough Linctus.**—*Can you give me a recipe for a simple cough-mixture for children?*—Most cough-mixtures contain morphia, which is very undesirable for children. We are very reluctant to take the place in any way of a medical man, any of whom would give you a prescription perhaps specially suited to the circumstances of your own family, for different families require very different treatment sometimes. But a very simple and good one of a mild type will be—Syrup of tar, 2oz.; syrup of Virginian prunes, 1oz.; water, 1oz. Give one to two teaspoonfuls pretty often. Two halves in succession of a Keating's cough-lozenge will be found a good expectorant and relief to irritation at night. The half is, of course, for a child; an adult would take two whole ones. They contain no opium. The great majority of colds may be warded off if one drop of camphor essence on sugar be taken every quarter of an hour during or after the very first chilly symptoms, followed, as soon as the slightest feverishness appears, by an aconite tabloid containing one drop of tincture of aconite, one every quarter of an hour for four doses, then every hour for a day, or longer if needed. The tabloids contain small but not homœopathic doses.

**Diet and Teeth.**—*Can the tendency to decay of teeth in young people be checked by dieting or any other means?*—So far as caries is undoubtedly increased by the greater modern use of sweets, meat, gravies, and sauces, it may be said to depend upon diet. But we can do little to revolutionise this—at least the majority in this country are never likely to be vegetarians—and all likely to be done in this direction is to encourage the greater use of such foods as wholemeal bread, oatmeal, and beans or lentils. Such will have influence upon sound teeth; but the main reliance must be placed upon training young people to the constant and systematic habit of cleaning the teeth both morning and evening, and more important at evening than morning, using salt or simple dentifrices slightly alkaline.

**Manuring Garden.**—*Which is the best time to manure an ordinary London flower-garden—late autumn or early spring?*—There is no such absolute rule. The nearest to one is, perhaps, that organic manures—such as stable or farm manure, or vegetable refuse, which act slowly by gradual decomposition—are best applied in autumn. Also permanent plants, such as roses, are best treated so, the manure being applied first as a mulching, and forked or dug in later on, when partly decomposed. Ground that is cleared, as after summer bedding or kitchen crops, is also best treated so. But mineral manures, and such as guano-water, are usually applied for immediate action, and of course different plants require such aid at various times, according to the cultural directions for each. But there is great elasticity and power of give-and-take in all culture, and no need to fret if things cannot be done exactly at the time laid down.

**Carpet-Sweepers.**—*Do you think the new patent carpet-sweepers are more likely to destroy the pile of the carpet, than an ordinary broom?*—There are several, but you are presumed to refer to the rotary ones, which work much like a mowing-machine. A wire-brush on such is rarely seen now: these were very destructive. Very hard brushes do wear the carpet. The machines with moderately soft brushes are good and do no harm.

**To Correspondents.**—One or two queries are unanswered, as not coming within the intended scope of these columns. One correspondent asks about snuff-taking; there is no reason why we should give here *opinions* on questions of this kind. Another asks if "anyone" can suggest employment for two elderly and blind women, whose hands are partially crippled. What *can* be done in such a case, save to get them if possible into an asylum? And we can neither undertake to solve almost insuperable problems of this nature, nor throw our pages open to correspondence about them. The intention was to answer practically, as far as possible, definite questions of a "household" character; and the continuance of the effort must depend upon how far such replies seem to supply any real help to our readers. One or two queries are answered with some hesitation as to their character; and in particular, while questions on general sanitary matters are proper enough, it is not intended at present to offer anything in the shape of personal medical advice. Correspondents should remember also the early date at which magazines go to press. It has been intimated that, in refusing to recognise anonymous letters, we deter some who may wish for information. Our object is solely to secure a *bonâ fide* correspondence, but we can assure our friends that names and addresses will not be divulged.

AN APPRECIATIVE AUDIENCE.

# SENIOR AND JUNIOR:

## A COUNTRY TOWN CHRONICLE.

BY LESLIE KEITH, AUTHOR OF "GREAT GRANDMAMMA SEVERN," "THE CHILCOTES," ETC.

### CHAPTER XIII.—A NICE LITTLE SCHEME.

SIR JAMES LOOKED AT HIS MAMMA FOR INFORMATION.

MELCHISFORD was not the only place in which Miss Kelynge's eccentric fortunes made a bustle, though the talk and the wonder and the conjectures originated there.

Like a stone which you drop into a pool, the news made ever-widening circles, till the rumour of it reached the big country houses half across the county. In Eastshire news travels slowly, but none of it is lost on the way. It is very precious, because—unless in the hunting season—there is nothing to do. If you cannot become enough of an Athenian to take an unflagging interest in your neighbours' concerns, Eastshire is not the place for you.

Very late in the history of her fortunes the vicissitudes of Mary Kelynge had reached the ears of Lady Hemmingway. The Hemmingways were, indeed, the nearest neighbours of old Mr. Hallett on the Broomfield side, and so, by a quite natural law, were among the last to hear of his sudden death and his eccentric bequest of his fortune. Lady Hemmingway had not immediately called, however, nor had she made her son, Sir James, call, because there had been no visiting between the two families.

The common people, with that passion it has for accounting for everything, said that this coldness arose from the fact that Lady Hemmingway, while she was still Miss Capel, had refused to become Mr. Hallett's second wife. As Mr. Hallett had never wanted a second wife, there was no foundation for this assertion, but Lady Hemmingway was willing enough that it should circulate without distinct contradiction on her

AN APPRECIATIVE AUDIENCE.

part; to have refused, or to be supposed to have refused, so excellent a match was a distinction she could appreciate.

Sir Robert Hemmingway, whom she did marry, was also dead, and his only son, now Sir James, succeeded to the title. It was about the only thing to which he did succeed, and possibly, if his mother could have taken his style as well as her own, she would not even have allowed him to be Sir James.

Sir James was about three-and-twenty, very solidly built, with neat side whiskers and a clean-shaven lip and chin. The lower part of his face was a little weak, and it was thus a pity to expose it; but somehow or other it seemed quite right that he should not have a moustache, as it undoubtedly might have made him look foolish. He did not look in the least foolish as it was, but eminently staid and respectable; and if an irreverent stranger sometimes mistook him for his own butler, especially towards dinner-time, we know that a similar blunder has been made now and then about gentlemen of much higher degree than our country squire.

The butler of Spens was indeed a much more imposing person than his nominal master, and, as Lady Hemmingway found, a great deal more difficult to manage. She had to use a little diplomacy when she wanted Cooper to do anything that was not in his bond, and to consider his easily injured feelings. But James had no feelings that particularly required consultation—or perhaps we ought to say his feelings were so exactly what his mother decreed that she had really only to consult her own.

"James is the best son in the world," Lady Hemmingway was fond of saying to her various acquaintances, "and so careful and considerate of his old mother."

She would not have liked anyone else to call her old, but perhaps she said it that she might have the pleasure of being contradicted. The late Sir Robert had been rather a difficult husband—that is to say, he had occasionally taken his own way instead of Fanny's, but James had no way of his own to take. He was, indeed, scarcely worthy of the powers of a lady who had so long practised a mild diplomacy that it was just a little flat and tiresome to be obeyed without having to make even the smallest struggle for victory.

James was so very good that Emily Smee used to profess a great deal of surprise that he had actually outgrown a pinafore and a rattle; she would even have invited him to nursery tea with her own little Harry if she had not felt that she would hopelessly offend her second cousin Fanny; and, much more serious, possibly hurt her husband's practice in the county.

It chanced that Mrs. Smee drove over to Spens in her little pony-carriage one day in June, when Melchisford had begun to lose the first glow of its interest in the Hallett-Kelynge affair. Now it also happened that Lady Hemmingway had conceived and matured a very brilliant plan between breakfast and luncheon which she was anxious to put into execution without delay, and when she recognised Emily Smee's fat pony leisurely walking up the drive, she prepared to receive her with something more than the usual cordiality. Fanny was not always charmed to see Emily, unless when James or any of the servants were ill, and it became useful to have a second cousin who had married a country surgeon; but on this occasion she even went down to the hall-door to meet her.

"Emily," she called out, "you are the very person I wanted to see. You have not brought that child with you?"

"No," said Mrs. Smee, yielding the reins to the small boy who was perched up behind, but stopping a moment to pat the fat pony. She looked up, and there was a laugh in her merry eyes.

"I knew what a disappointment it would be to you—you who are so fond of children—but I couldn't risk the blistering of his little nose in this hot sun."

The blistering of Master Harry's nose did not interest Lady Hemmingway in the least, but she bore the explanation with patience.

"Your boy had better take the pony round to the stables," she said; "you have come to spend the afternoon, I hope? We have had lunch, but I daresay Cooper wouldn't mind letting you have a little cold meat—"

"I couldn't think of troubling Cooper for the world!" cried Emily, who took pleasure sometimes in playing the rôle of poor relation; "but I will come upstairs with you, Fanny, and by-and-by you shall give me a cup of tea."

She followed her hostess to the drawing-room, privately wondering whose tongue that hard-worked man, her husband, would have to examine gratis in payment of that generous offer of cold meat.

"How is Sir James?" she asked, when the two ladies were comfortably seated in easy-chairs by an open window.

"He is quite well; indeed, my dear Emily, I may say he is remarkably well. Not that James does not always enjoy good health, except for a bilious attack now and then."

"Yes," said Emily, who had an excellent memory of Sir James's bilious attacks, since they generally required her husband's presence in the middle of the night. "I thought perhaps he might be having one now."

"What could make you think that?" said Lady Hemmingway, opening her round grey eyes. "My dear Emily, I think being continually with a doctor must make you a little fanciful. Dear James was never better in his life, and his spirits are quite wonderful."

It was on the point of Mrs. Smee's wicked tongue to ask if he had got a new pop-gun or go-cart, but she resisted the temptation, and presently she was rewarded.

"Indeed," Lady Hemmingway went on—"take a footstool, Emily, and make yourself comfortable—it was about James I wished to consult you, and if you had not happened to come over to-day I should very likely have driven into Melchisford this afternoon."

This was an honour; indeed, to be consulted about Sir James was almost like being con-

sulted by Fanny herself, since they had but one mind and will between them. Mrs. Smee had a lively imagination, and she rapidly reviewed all sorts of possibilities. Could it be that James had developed symptoms of insanity? But no, his mother had said that he was perfectly well; and, besides, she reflected, James had really no mind to go out of. Before she could conjecture further, Fanny said, rather abruptly,

"I want you, my dear Emily, you who have such good opportunities of hearing everything, to tell me all about this strange affair at Hallett Place."

"Oh," said Emily, suddenly pulled up, "we've actually begun to put that exciting topic second at the Melchisford tea-parties. Old Mr. Turnbull's marriage—he is eighty, you know, and he has married a girl of eighteen—is the absorbing subject at present; we are profoundly anxious to know what she took him for, since she has money and he has next to none."

Lady Hemmingway waved her hand as if she would brush aside old Mr. Turnbull and his patriarchal wooing. It was rather vulgar of Emily to interest herself in all the local gossip, and on other occasions she would not have scrupled to tell her so; but she had a use for Emily, and she summoned her patience.

"We live out of the world here," she said, with dignity, "and we are not in the way of hearing every rumour as you are. James does not encourage idle tale-bearing, and consequently we hear nothing—absolutely nothing."

Emily smiled demurely. It was rather hard to be stigmatised as a gossip, and yet compelled, at the same time, to pass on the last whisper of scandal. Then she remembered that simile of the stone in the pond, and she knew that the widening circle had at last embraced Spens.

"Tell me what you want to know," she said, "and I will do my best to be a tale-bearer."

"I called at Hallett Place yesterday. I took James with me. I should have felt it my duty to call on poor Miss Kelynge earlier, but I thought she might like to wait before seeing people till she had got her mourning" (Lady Hemmingway had not been able to mourn Sir Robert till the proper amount of crape had been decreed for her in Paris), "and—and till she had got over things a little; it is always painful and awkward at first, especially after a sudden death." She spoke as if it was most inconsiderate of any one to die suddenly. "But it seems I have put off too long, for I was extremely amazed to find the house shut up—actually shut up without a servant in it, except an old person without a cap, and not even a black gown."

"Miss Kelynge has come to Melchisford," said Mrs. Smee, who began to have a very lively understanding of the point towards which Fanny's remarks were verging. "She found it very dull at Hallett Place, and she is living with her lawyer and guardian, I suppose you would call him—anyhow, he is the arbiter of her fate."

"Not the proper place for her," said Lady Hemmingway, with the decision of a superior mind. "I went yesterday intending to ask her to come here—to pay us a visit. It would not be dull for her here. Of course, just at first she could not go much into society; but there would be no harm in a quiet little dinner, or one of those dreary concerts in your corn exchange, and on other evenings James would play bagatelle with her. He is remarkably fond of bagatelle."

If his mother had said that dear James was remarkably fond of his hoop it would not have surprised Emily.

"But, Fanny," she said, and she laughed quite merrily, "don't you think there might be some little risk if there was too much bagatelle? Not that Miss Kelynge is a very susceptible or inflammable person, or dear Sir James either; still, you know, bagatelle every evening!"

Then Fanny found that she could no longer beat about the bush. Indeed, to do her justice, she generally took a straight path if she could manage it, even though she trespassed on private ground to do it.

"Emily," she said, looking straight at her visitor, "I am sure you, as a mother yourself, must understand the great importance of fixing on a suitable wife for your only child."

"Yes," said the irrepressible Emily; "yes, I haven't *quite* decided on Harry's bride yet."

But Lady Hemmingway ignored the frivolous interruption.

"Dear James has never seen any one whom he would like to put in my place; he has not yet even thought of marrying." This was very true, since James had not as yet been told to think of marrying; but Emily understood that he was to be led forthwith to entertain this idea. "Now, Emily," she went on in a firmer tone, "there is a good deal of nonsense talked about marriage; there is no subject, indeed, on which people can be more foolish. I am not a romantic person myself—not romantic as *you* were, Emily—but when I accepted Sir Robert I knew that we should be very comfortable together. Dear James is like me: he is sensible, and not foolish or romantic like you, and when he marries I am sure it will be some one suitable in every way: in rank, and position, and fortune."

"Yes, yes; and in intellect," said Emily, so gravely that Fanny never detected the irony.

"And in intellect. James is not, perhaps, brilliant, but he is solid and sensible. These are far more lasting qualities than mere brilliance; happiness does not lie in the intellect." When Fanny was interested in any subject she always spoke as if she were preaching. Perhaps it was because James's solid and sensible mind preferred that form of instruction. She liked the last phrase so well that she repeated it—"Happiness does not lie in the intellect."

"No," cried Emily, "it lies in a house in town and a house in the country, and a wife whose estate marches with your own, and whose income trebles yours."

This time Lady Hemmingway perceived the sarcasm, and she took one of those short, direct cuts that were the promptings of an instinctive honesty struggling to assert itself.

"Emily," she said, "I should like James to

marry Miss Kelynge. It is a suitable arrangement—a very suitable arrangement for both of them, and for me. From what I can hear she is a most amiable girl, and she would not thrust me out of my place. I should not like to be thrust out of my place even for the sake of my son's advancement. But if she is an amiable girl we should get on. I would be very good to her if she did not thrust me out of my place." She meant, "If I am able to manage her as I manage James," but this was how she put it. Then suddenly she paused, she even blushed a very little.

"You think all this very worldly-minded, Emily; you are shocked."

"No," said Emily stoutly. She had really been secretly pleased with the frankness of the avowal. Then she laughed.

"I am not a bit shocked, in spite of my romantic tendencies. There is nothing that so convinces you of the advantages of being worldly-minded as marrying a poor doctor with nothing to speak of in the way of an income. Catch the heiress by all means if you can, but make sure she is an heiress first."

"Not an heiress?"

"It wouldn't be quite safe to adopt her for some months yet," said Emily with twinkling eyes. "I think Sir James should restrain his ardour for a little while. Haven't you heard of the lost grandson about whom nobody knows anything—not even whether he is flesh and blood or simply dust and ashes? A dead man wouldn't be a formidable rival, but a living one to step in at the last moment! Better wait, Fanny, better wait."

"But this Mr. Hallett must know."

"Nobody knows anything. If I had only some young cousin in want of a career, I would set him up as a claimant, but I haven't, and my own boy is in petticoats. Such a lovely pie, and I can't get even my littlest finger into it!" She rose with a laugh. "Fanny, I must go without even your kind offer of tea."

"No, sit down," said Fanny urgently, "you shall have tea; I will ring for it at once. Are you quite sure of this, Emily?"

"Quite sure."

"And you think this young man will be found?"

"No, honestly I don't, but he may."

"One must take some risks," said Fanny, thoughtfully, "but perhaps it is as well to be cautious and not to invite Miss Kelynge here for a little while. I had been thinking, Emily, before you came that *you* might have her on a visit."

"Impossible, quite impossible, even to oblige you. Where should I put her? Our house is like a gown made a size too small: it pinches us everywhere, and really there is no room in it for so expansive a creature as an heiress."

"Then you must have her to dinner or to lunch. Lunch would be better, because James is often at Melchisford at that hour and he could drop in. It will do Dr. Smee no harm if James is seen dropping in."

"It certainly would be more convenient if he happened to have one of his bilious attacks when he is in Melchisford at any rate," said Emily demurely. "Then he could drop in, as you say, and if Miss Kelynge chanced to be with me she might cure him."

"You must help me, Emily," said Fanny impressively, giving Emily quite a liberal share of cream. "We are cousins; we must stand by each other. And now about your house—you must really get the doctor to think of London. Harley Street—Harley Street is the place. I was speaking to the Baxters the other day, and telling them how clever he is and how speedily he always cures James's bilious attacks—you ought to urge him, you really must persuade him, to go to London."

"But not before dear Sir James is married," said Emily innocently.

When the fat pony was brought round, and the ladies were crossing the hall, Sir James came out of a little side room, where he kept the whips and guns and fishing-rods he never used, and the books he never read. He looked less like the butler in his morning clothes, but more than ever to Emily's eyes like the good little boy just brushed and pinafored and sent down from the nursery to shake hands with the visitors.

She smiled when she held out her hand.

"I hope to have the pleasure of seeing you in my little house next week," she said.

Sir James looked at his mamma for information.

"I have been telling Cousin Emily that you will drop in on her next time you are in Melchisford," she said. "Cousin Emily will give you some lunch. You know, James, the sherry at the King William never agrees with you."

"I shall have great pleasure in lunching with Cousin Emily," said Sir James, with his prim, good-boy manner, as he helped her into the pony carriage.

Emily laughed softly to herself all the way home, to the consternation of the small boy who sat behind, and who thought his mistress had gone mad. But she was not mad, only very much amused.

When she got home she flew straight up to the nursery and hugged her baby boy.

"My dear Harry, I must seriously begin to consider a suitable matrimonial alliance for you," she said, in her solemnest tones, to the staring baby. "You are only one year old, to be sure, but a mother must look a long way into the future."

At dinner she was in her liveliest mood, and kept the doctor amused; but he had to go out, after a hurried meal, and so she could only give him a very imperfect sketch of her visit.

"I think, dear, Sir James is going to have another little illness very soon," she said—"perhaps next week."

The doctor groaned; then he frowned with a sudden resolution.

"The brown mare has got a strain," he said; "she is not fit for a ride like that. And, what is more, Emmy, I've made up my mind that I can't, and I won't, go to Spens again, except as a regular medical adviser! I don't see why, because Lady Hemmingway is your fourth cousin—"

"Not fourth, Harry; nearer a cousin—sister

almost!" cried Emily, getting up and perching herself on the arm of her husband's chair. "And Sir James isn't going to put you to the trouble of going to Spens any more; he is coming here to consult you—dear James is so sensible!"

"What do you mean, Emmy?" cried the doctor, staring up at her; "I don't want the fellow to come bothering here, getting my opinion for nothing."

"Oh, not for nothing; he will pay you cheerfully if you send in your bill. He is coming here next week to lunch because the sherry at the King William always disagrees with him. And, Harry, Fanny was saying that it is a shame of you to waste your talents in Melchisford, and that you really ought to go to London—to Harley Street. She has been telling the Baxters that Harley Street is the place for you."

"Pooh, nonsense!" said the doctor, getting up and pulling down his waistcoat; "Melchisford is good enough for me."

But in his secret heart he was not displeased that he was considered too good for it—even by a woman whom he a little despised. It was only his gruff coadjutor, Dr. Rose, who held himself disdainfully above all such flatteries.

### CHAPTER XIV.—A DIVIDED ALLEGIANCE.

LAVINIA MOSS went back to Chalk End on the very morning of the evening already described. She set out so early, indeed, that her uncle was still asleep, and her aunt, with a handkerchief tied over her head, was engrossed in those household concerns which she took betimes so as to leave a great part of the day free for that minute observation of the street that was her sole pleasure.

At sight of Lavinia, with her hat on and her jacket buttoned, Mrs. Mellish laid down the duster and waited for an explanation.

"I'm going," said Lavinia, shortly.

"Not before you've had breakfast?"

"You can give me some bread-and-milk, if you like; I can't wait till you make tea or cook anything."

Mrs. Mellish never wasted words, and she did not pause to oppose Lavinia's wishes. She got the bread-and-milk silently and quickly, and arranged it on a corner of the dining-table, then she picked up her duster, but she did not go on with her task.

Lavinia ate and drank for a minute or two in silence, then she looked up.

"Aunt Hannah," she said, "why do you look at me like that? I haven't lost my appetite!" She laughed, a little hardly. "I'll have some more milk if you'll be quick in getting it, for I must set off."

"The carrier won't pass this hour and more."

"I'm going to walk," said Lavinia; "I'm just as able to walk as ever I was, and more. Did you think I was going to sit up in my room and cry?" she asked, with a sudden disdain. "I'm going home. Father and the girls won't expect to see me, though I daresay father doesn't know I've ever been away. I'm going home, Aunt Hannah, and that's all I've got to tell you now." She got up and pushed back her hair. "When there's anything more, you'll hear it."

Hannah Mellish looked up into the moody, passionate young face, and her eyes glittered with sudden fire.

"Lavinia Moss," she said, "he's been false to you!"

"I never said it!" cried Lavinia, with a sudden burst of anger. She put her hands out and caught the little rigid figure firmly by the shoulders as if she would have shaken it. "I never said it, and you—you'd better not dare to say it! I'll take my own time and way to say what I've got to say, and if you so much as whisper a word to anybody—to Uncle John, even—" Then she suddenly withdrew her hands and laughed, giving her aunt a half-playful push from her.

"I'm awfully cross!" she said. "Won't the girls catch it when I get back, unless I work it off on the way! But you, Aunt Hannah—I needn't have worried myself about you; you are safe enough; you will say nothing, for you are a Moss, like me!"

Mrs. Mellish neither resented this rude assault nor the forgiveness which Lavinia kindly bestowed upon her, and when the girl nodded an abrupt good-bye, and went quickly out of the room, she stooped down to dust the table-legs as if nothing had disturbed her in the regular course of the morning's work. But Lavy was right: Hannah Mellish was first and foremost Hannah Moss.

On that same afternoon Mrs. Hallett failed for the first time for many months to exchange the afternoon greeting with her brother that had come to be a bit of her day's incident. She was at her post, but John Mellish was not at his, and his absence disturbed her strangely. She felt it was extremely foolish to connect it in any way with the Mosses, but she had seen Lavinia at the opposite window on the day before; and somehow, rational or irrational as was the suspicion, she blamed the girl in her secret heart for keeping John away.

Lavinia, of course, had nothing to do with it, as she had been for many hours at Chalk End, and when Mary Hallett found this out by accident she was very much ashamed of herself. To suspect anybody wrongfully is always a pain to a good and simple nature. It was at dinner-time that she discovered her mistake.

On summer mornings Hester often rode very early with her father before the business of the day claimed him. She had ridden with him that morning, and the talk being turned on the expedition, Mary Kelynge remarked that it must be queer, "and wasn't it lonely to be out so early?"

"That is the beauty of it," said Hester, with enthusiasm. "It is so lonely and so still that we seem to have all the world to ourselves—a fresh, new world, just made for us. We met no one to-day." She paused, and then added, with abrupt precipitancy, "Except Lavy Moss." She

coloured as she spoke the name—it brought back so vivid a consciousness of her first estrangement with Andrew.

"Lavinia Moss!" said Mrs. Hallett—and she too blushed, though from a very different cause—"at that hour in the morning?"

"Farmers' daughters are used to be up betimes," said Andrew, with perfect ease, smiling frankly at his sister; "they've got to catch the early worm."

"Neither Moss nor his daughters will ever catch anything worth picking up," said Mr. Hallett, grimly. "Moss is a hopeless muddler, and his girls are giddy, silly fools. That one we met to-day had a feather in her hat—I noticed it. What right has she to feathers when her father can't so much as pay his tithes?"

He looked round but nobody answered, the subject had its awkwardness for everybody present but himself.

"Mellish should take care how he gets mixed up with Moss; you should give him a word, Mary."

No more impossible task could have been set Mary Hallett than this of giving her brother a word about his wife's connections. His love for his Hannah would alone have deterred her, for she cared too much for this only brother to hurt him by even a hint that she held him to have chosen unwisely.

This struggle between opposing affections is one to which a wife is often subjected, and it is one for which, as a rule, her husband has very little sympathy. It is so much more easy for a man to cut himself adrift from entangling relationships than it is for a woman, who cannot forget her own people and her father's house, even though she voluntarily exiles herself from them.

But if Mr. Hallett were really minded to give his brother-in-law a warning hint he had an immediate opportunity.

He was sitting alone with his wife in the drawing-room, the young people having wandered out by the open window into the garden, when the knocker of the outer door sounded loudly in the silence.

"That is John's knock," said Mrs. Hallett, starting nervously.

"How can you possibly tell that, Mary?" said her husband, irritably; "you are growing quite fanciful."

But she was right, for the next moment John Mellish's voice was heard in the hall.

"Why doesn't he come in? I—" Mrs. Hallett had risen, not quite liking in the face of her husband's evident annoyance to go out to her brother, and yet suffering an undefined anxiety to see his face, but before she could decide how to act, the servant came in with a message that the banker wished to speak with her master.

"Show him into the study," said Mr. Hallett, briefly.

"Oh, Andrew, not the study," pleaded his wife. "It is John, my brother. You—you treat him as if he were a stranger."

Mr. Hallett had put down his cup and risen to leave the room, but he paused and turned to look at his wife, surprise for a moment mastering his annoyance.

"Mary, what has come over you? You are behaving like a child. Mellish has come on business. I always see everyone who comes on business after office hours in my private room, as you know very well."

"But John—our brother—won't you take him into the dining-room, Andrew? It—it is pleasanter." Her fair face was flushed and her sweet mouth a little tremulous.

"The dining-room—with the servants and the young people constantly coming out and in? Nonsense! If you want to see your brother he can come in here after we have had our talk." He went out of the room and shut the door with a bang that decisively closed the argument.

Mrs. Hallett sat down again in her chair, but she could not at once still the trembling of her lips or conquer the fears that beset her. She listened eagerly for the greeting between her brother and husband, but, though she could hear no words, the tone of their voices had for her ear an unfriendly sound. She tortured herself with conjectures over the business that had so unmistakably annoyed her husband. The very name of business had for her the vague terrors it has for those gentle, well-sheltered women who have never been allowed to share any of its burdens. And why, if the business was not unpleasant, should Andrew take John to that dark, dismal little study as if he were a servant about to be reprimanded or dismissed? She had not wondered why he took Miss Kelynge there; it had seemed quite natural and fitting that their guest should be invited there when her guardian wished to consult her, but not John—John who had come out and in familiarly, had sat at their board and shared all their family joys and sorrows so little a while ago and yet so long a time too, as it seemed to her sisterly affection.

"It is the Mosses who have done it," she said to herself, with that jealousy from which the best of women are not exempt. "But for the Mosses, John would have been here every night as he used to be, and there would have been no talk of showing him into the study as if he were a stranger."

She sat for a long time quite idle in her chair, waiting and listening for the distant sound of the study door and the fall of steps in the corridor. Andrew would be sure to bring John back with him to the drawing-room when their talk was over. Then she would know—would see for herself that it was nothing but ordinary business that brought him. He had often, though perhaps not so often lately, consulted her husband.

She got up suddenly and rang, giving orders to the maid for wine and spirits to be brought, and the little brass kettle in case hot water should be wanted.

"And you needn't wait up, Sarah," she said; "your master is busy to-night, and he will not have prayers."

She was so engrossed with her preparations that she started when Hester came in like a ghost in her white dress, flitting in from the outer dusk.

"Mother," she said, "has Uncle John been here? Why didn't you tell me?"

Hester and her uncle had the attraction that simple natures have for each other, and were very good friends.

"He hasn't been here yet," said her mother eagerly, "but he is coming, dear. I expect him every minute. Uncle John is in the study. He is with papa—"

"But he is gone," cried Hester. "I was giving Bess a lump of sugar, and when I came out of the stable I almost ran against him, but he brushed past me as if he didn't see me. I thought it so odd. He went home that way—by the yard door."

"Gone!" cried Mrs. Hallett, "without coming here?" Her voice had such a frightened ring that Hester went close up to her.

"Mother," she said, "has anything happened? Why do you speak like that?" But Mrs. Hallett rallied instantly.

"Nothing has happened," she said, "nothing. How could you take such an idea into your head, Hetty? Uncle John came to speak to papa on business; that is why they were in the little study, and I daresay uncle found it quicker to go out by the yard door. No doubt he was in a hurry; I was only disappointed he didn't come in for—for a chat, that was all."

"I hope it wasn't disagreeable business. Uncle John looked so odd and queer—"

"Business is always disagreeable," said Mrs. Hallett, dogmatically, "and it makes people look —queer. I am sure you must have noticed how worried papa often is. And my father—I remember he used to look sometimes quite cross when he came up from the bank, though he was really the most amiable man in the world."

She still spoke in that eagerly persuasive tone that seemed so unnecessarily convincing, but it was her own inner fears she was combating.

"And Hetty," she went on, "you won't say anything to papa—about Uncle John looking queer, or—or our being disappointed he didn't come to chat with us? Men don't like women to allude to business, Hetty; remember that when you are married, dear. Never ask your husband about business; it only worries him."

Hester could hardly help laughing, though she kissed her mother in the darkness.

"You and I will go over and have tea with Uncle John to-morrow," she said, "and scold him for running away from us. And I will remember your advice, mother—I will lay it up like a German girl's house linen in case I should acquire a husband some day."

It was so dark when Andrew and Miss Kelynge came in from the garden that even Hester's white dress was scarcely discernible.

"Blind man's holiday still, mother?" said Andrew junior, in his loud, cheerful young voice. "Take care, Miss Kelynge; let me go first and light the candles. It's like night here, and you may knock up against something and hurt yourself. Got a headache, mater?"

"Yes, a headache. Hetty and I have been sitting in the dark. Light the candles if you like, dear," said Mrs. Hallett, speaking rather hurriedly and uneasily, "but I think you needn't mind the lamp; it is late and papa is busy, and isn't it nearly bedtime?"

She was uneasy until she got the young people sent off, Andrew to smoke and the girls to their rooms. She carried the tray and glasses away with her own hands, and put out the lights and shut the windows, and then she too went upstairs. Her husband might think she was making a fuss if she waited up for him.

"Men do not like to be asked questions," she said again to herself. "He will tell me to-morrow if it is anything."

Her bedroom window faced George Street, and her first act was to draw aside the curtain and look out. The opposite house, at a first glance, seemed reassuringly blank—a house of sleep—but presently she thought she could detect a little thread of light stealing from behind the shutters of her brother's private room. Could John be keeping watch too? She strained her eyes to look again, and now she could not see the light at all, and made sure it was only the reflection of a street lamp that had deceived her. The stable clock struck midnight as she stood there, a late hour for a man of John Mellish's simple, regular habits to keep vigil. She told herself again that she was mistaken; that her foolish fears were groundless, and would vanish before the morning sunlight as an evil dream when one wakes from troubled sleep. But she took them to bed with her, and they were strong enough to banish rest, though she feigned sleep when she heard her husband's step, so that her wakefulness should not seem to reproach him.

She slept at last when it was clear daylight, and her first return to consciousness was the sound of her husband moving about in his dressing-room. At first she was aware only of a dim sense of uneasiness, but soon she remembered everything clearly. Her fears—and she was always open to their assault—were scarcely soothed by the bad temper which Mr. Hallett brought with him to the breakfast table.

Though subject to occasional displays of anger, as are all pompous and masterful natures, the lawyer had never been one of the men who are habitually unpleasant in the family circle. He was proud of his wife, his son, and his daughter He liked to think that they were better-looking better housed and fed, and, in the case of his boy and girl, better educated than the children of his neighbours, and the knowledge kept him in the main good-natured. It is wonderful how good-tempered you can be when you can set all your virtues against a background of prosperity. But of late a shadow had fallen on the lawyer's geniality; he was uncertain of mood, easily irritated, sometimes gloomy, often annoyed for no apparent cause. The family barometer stood at change, and all the household felt the chill of impending storm.

On this particular morning Hester had come down wearing her riding-habit, only to find that the indignant Davies had been ordered abruptly to take the horses back to the stable. There was to be no riding that morning into a fresh new-

made world. Even the young girl who knew no more of business and its hazards than her mother felt that there might be days when the world looked old and sad.

Mr. Hallett scarcely touched breakfast; nothing was to his liking: the coffee was cold, the toast was burned. At another time Mrs. Hallett might have felt piqued at this slight on her excellent housekeeping, but she was too miserable to feel annoyed.

"There is cold pie on the sideboard, or will you have a broiled bone, dear? Hetty, run and ask cook—"

"Sit still, Hester," said her father, pushing aside his cup and rising. "I can't wait till a fresh breakfast is cooked."

Then he turned upon his son, who was helping himself liberally to the despised pie.

"Do you mean to dawdle here all day, sir?" he asked, and his tone was so savage that Miss Kelynge gave a little jump in her chair, and even the experienced Andrew was too much surprised to find a ready reply. "You ought to have been in the office an hour ago, as you know very well. A fine thing that your father should be toiling and grinding while you sit taking your ease!"

Andrew pursed his mouth into a whistle as he stared at the door by which his father had disappeared.

"What's up now?" he began, but his mother rose suddenly and went to him; she could hardly steady the hand she laid on his shoulder. "Oh, Andrew dear, do go! don't keep your father waiting; don't displease him; he—he is ill."

"Ill?" echoed Andrew, shrugging his shoulders; "he's only"—he turned his head, and when he saw how distressed and uneasy she looked, he altered the form of his phrase.

"How easily you are frightened!" he said; "it's only some stupid business worry that has upset him, mater; he'll come up all right at dinner-time."

"He has eaten no breakfast, and I suppose he won't have time to come up for lunch?"

"No; you'd better send down something extra good. There's nothing soothes the savage breast so effectually as a good square meal."

He looked at Miss Kelynge, and at sight of her scared, frightened face he laughed.

"You are all cowards," he said, "and you've none of you any pity for this poor scapegoat."

His mother kissed him. "Be a good boy," she whispered, but she could not take any comfort out of his easy assurance. "He doesn't know; he was out in the garden last night," she said to herself; "he knows nothing."

Her anxiety grew as the morning passed; she felt that she could not wait till evening to see her brother, as Hester proposed; she could not take Hetty with her to tea, as if—as if nothing had happened. She could not even bear the burden of her suspense till the afternoon, when John might appear at the opposite window with a smile on his good-natured face, and so end it. She must go now—at once.

Then she remembered that her husband might see her; the window of his private room, too, looked upon George Street. He would see her, and he might not like it; he would think her curious, prying. The blood came up into her cheeks, tingling, throbbing there. For a moment she was tempted to go secretly—to steal in by the tradesmen's entrance at the back of the bank-house; but the temptation had scarcely time to take form in her mind before she rejected it. Her instinctively sincere and open nature recoiled from even so slight a departure from candour.

"I will go openly, or not at all," she said, whispering the words half aloud, as if to give strength to her decision. "I will go openly, and I will tell Andrew to-night why I went."

She tied on her bonnet eagerly, not giving her resolve time to cool, and went into the open daylight with a step that did not falter. It never occurred to her that John might think it strange that she should go to him at twelve o'clock, the busiest hour of a business man's morning. Some instinct told her that John would know—would understand—would expect her. Her heart was very tender and full of softening memories as she stood a moment on the steps and looked across at the red house opposite. She saw her husband's figure indistinctly behind the wire blind; his head was bent, and he did not look up. Her eyes travelled with eager affection over the tall, handsome house that for so many years she had called home. Hester's pretty head suddenly appeared at a top window, where she was hanging out her canary in the sun. She caught sight of her mother, and gaily kissed her hand. A sudden lump came into Mrs. Hallett's throat. What a happy home it was, and what a happy woman she ought to be with such a husband and children! But the bank-house was home too—and if John were in trouble?

Her eyes were a little dim as she walked into the outer office.

"I have come to see my brother," she said to the senior clerk, who looked a little surprised, but said that Mr. Mellish was in and alone. She trembled before all the young men at their desks, and felt sure they knew why she had come. She knocked at the manager's door before one of them could reach it, and, turning the handle without waiting for a reply, went in.

John Mellish did not look up; perhaps he had not heard her appeal. His head was supported on one hand, and he sat seemingly lost in heavy thought.

Mary Hallett's heart took an onward leap of dread.

"Oh, John!" she said, "won't you look up? Don't be angry with me for coming. I—I didn't see you last night——"

At the sound of her voice the banker lifted his head, and his dazed expression gave way to one of anger.

"Has he sent you?" he asked, sternly.

"Nobody has sent me," said Mary, wondering and tremulous with crowding fears. "What is it, John? Why do you look at me so strangely? If anything has happened, tell me. I cannot bear this any longer."

Her brother looked at her for a moment or two

without speaking—a moment in which he had time to summon gentler thoughts, for when he spoke his tone had lost its bitterness.

"Poor Mary, poor lass!" he said, "it's no fault of yours that you need vex yourself over it; but you shouldn't have come here. The less you come here the better your husband will be pleased."

"Do you mean that—you have quarrelled?"

He nodded.

"Put it that way if you like; that's what he'll tell you, like enough. We've fallen out, and there's an end of it."

Mrs. Hallett had not taken the chair he had pushed forward for her. She stood behind it, and grasped the back of it with both hands as if to steady herself.

"Oh, John!" she said, piteously, "don't say that; don't say you've quarrelled past mending! Andrew—my husband—is hasty, and he—he has had a great many cares and worries lately. I have seen it; he has been worried and harassed, and—and different, and perhaps if you had been a little more patient—if you had yielded—it's not like you to take offence at a word——"

John Mellish listened to this pleading with a face that was flushing and gathering displeasure once more, but he controlled himself with an effort.

"You'd best not meddle in this matter, Mary," he said; "you'd better let it rest. It's past being mended by a woman's tears. Patience for him with his worries!" he broke out fiercely, "when he has done his best to ruin me, and won't move a finger to help me." But at sight of her tearful face he subdued himself abruptly.

"He's your husband," he said; "I'd bite my tongue out before I would say a word against him to you. But you'd better go, my lass." He spoke as if she were the little Mary of the bank-house days. "You'd better go, for when a man's blood is up there's no telling what may come out of his mouth."

He rose to put an end to the interview, but she put out her hand and held him by the sleeve.

"John," she said, "does it—do you mean that I am not to speak to you—that we are not to meet any more?"

"Meet? Pooh, nonsense!" he said, with evasive lightness, looking at her kindly. "Melchisford isn't such a big place that folk can lose each other, and we're near enough to see each other every day if it comes to that. Now, you go home, and don't fret; or, since you're here, won't you run up and have a chat with Hannah? She's alone."

But at the mention of her sister-in-law, Mrs. Hallett rallied her broken courage.

"Not to-day," she said, feeling all at once a strong impulse to escape; "I can't go up to-day."

In her heart she was blaming Hannah Moss for this new ache she suffered there. If it had not been for the Mosses, Andrew would not have been displeased," she said to herself, quick to make excuses for him.

This new stirring of resentment diverted her thoughts a little, and helped her to go out of the house with a firm step; but once outside, the whole perplexity of her position seemed to meet her in the face. She was going home, but it was home, too, endeared by a thousand memories, she was leaving.

Her placid, still life seemed all at once to bristle with difficulties. "I cannot forsake John," she said; and yet quick as lightning came the response—"still less can you condemn your husband."

In that brief moment she suffered all the pangs and penalties of a divided allegiance; for the first time in her experience she knew that to love might be to suffer.

## CHAPTER XV.—STRANGE REVELATIONS.

"YOU don't seem to be making much progress."

"No; I'm afraid I wasn't cut out for the detective business, and the novels haven't helped much. A strawberry mark on the arm may be a convenient way of identifying lost property in books, but it's a poorish clue when you come to stake your chances on it; the handkerchief-with-a-coronet-on-it-business is also rather played out; besides, our lost man is only a commoner."

Three young people were seated in the grounds of the Crystal Palace on a certain Saturday afternoon. They had been listening to an organ recital, and now they had come out into the sunshine among the June roses.

"And have you nothing to tell us, Tom dear?" asked the girl, who was small and slight, and who had bright and pretty brown eyes.

"Yes," said Tom, appropriating her hand, seeing that they were in a quiet corner where the foliage rose behind them, and hid them from curious eyes. "I asked you, Will, and you, Dot, to come here to-day because for one thing it is pleasanter to talk in the open air."

"Oh, ever so much pleasanter," said Dot, "and especially if it is good news you have to give us, Tom."

"My dear, I don't know that you will think it good. In the first place I must talk to you a little about myself."

Dot's brown eyes were fixed on his face as if to assure him by the love and perfect trust shining out of their clear depths that this was always a welcome topic, and Will took the pipe from his lips to say, encouragingly—

"Go ahead, old man."

But Tom seemed a little moved, and could not at once command words.

"I'm not a good hand at a yarn," he said at last, "but you'll have patience with me, I know, and let me tell it in my own way. And I'm going to begin with a confession. Will, you remember the first time we spoke of old Mr. Hallett's will?"

"I remember. What then?"

"You advised me—it was a jest, I know—to try my luck, to see if I hadn't possibly a chance."

Somers turned, and looked at him eagerly as he paused.

"Do you mean to say," he began, "Tom"—

he went on impetuously—"I always knew there was more behind your story than appeared."

Tom was softly patting the little hand he held, and when he spoke, it was absently, and as if he had not heard this assertion.

"Don't imagine that I envied the dead man's wealth," he said, "at least, not at first; but the whole queer, complicated business set me thinking. Suppose I should have a chance after all? Dot and I could get married at once, and Will and the Doctor would live with us. Well, that was a pleasant thought, so pleasant that by-and-

TOM IS NOT A GOOD HAND AT A YARN.

by it seemed as if it must come true, and I began to picture our life in that fine, big house among all our old friends, we the richest and grandest of them all, where we had been the poorest and obscurest. No need for the doctor to pinch and scrape and live in shabby lodgings on the shillings and sixpences of his patients; no need for Dot to lose the roses out of her cheeks by teaching any more. As for you and me, Will, we should have turned our backs on the city, with its din and its grind, its hard work and its poor pay. A pleasant picture, you see, and the more I thought of it, the more my circumstances seemed to fit the case. When you are in ignorance of your relations, it's easier and more satisfactory all round to imagine them illustrious than obscure." He smiled a little soberly.

"Get on," said Will; "don't pull up to moralise. What have you discovered?"

"The folly of letting one's fancy run loose," said Tom. "Dot dear, you will never be the mistress of Hallett Place."

"I never wished it, Tom, never once."

"No, Dot, no, and we're better without the wealth, believe me. That day or two I was foolish enough to entertain that insane dream showed me to what ugly deeps a man may fall through the greed of gold. Hadn't I boasted to you that I trusted the doctor, Will, and wasn't I beginning to doubt and suspect his motives—even to question his honesty? And as for the heir, I believe while the madness lasted I was capable of half murdering the poor fellow if he had turned up."

"I don't believe it," said Dot, very quietly; "you would have been the first to help him to his rights, Tom."

He thanked her with a look.

"Perhaps I may have that chance yet, by way of atoning for all the murderous thoughts I had of him; I think that chance may be mine."

"Tom," said Will with decision, "if you go on dribbling out your news drop by drop, I'll be obliged most reluctantly to wring your neck for you."

"Don't," said Tom, with a deprecating laugh, "let me go on in my own way. It's an awfully slow and clumsy way, I know, but you will soon hear all there is to tell. You may ask me, Dot, and you, Will, why, if I was in doubt about my past, I didn't go frankly to the doctor instead of worrying over his possible motives for keeping me in the dark? Well, when I came to my senses that's just what I did. And he behaved as you might have expected."

"Extinguished you on the spot."

"No, he was honest with me, as he has always been. 'So you've caught the general infection,' he said, 'and you think it would be a fine thing to wear a dead man's shoes? You want to share the spoil?'

"'I want to know who I am,' I said.

"'Very well,' he answered, 'I will tell you. I haven't gratified your curiosity before because it wasn't a very pleasant thing to hear, but you shall hear it now if only to disabuse you of the mad idea that you have the remotest claim to Hallett's money. You have no more right to it than I. Your mother was my cousin, and the only woman I ever cared for, but she preferred your father. He was a medical man with a fair practice when she married him, but it was not by his skill or his discoveries, or his work among the poor, he became famous; and when you know his name you will understand how it was that he was never made a baronet. You bear your mother's name and mine, but this is the one you've a right to by birth.'

"He wrote a name on a bit of paper and pushed it across the table to me"—Tom's voice grew husky—"I knew it. It isn't one to be proud of. I have seen it in the public prints, I have heard it on people's lips, little dreaming that it was my name and my shame they were discussing. Dot, my wife to be, Will, my brother"—he looked at them both—"you won't ask me what it was? He is dead, and—we will let his story sleep. Thank God, he repented before the last, and if the All Merciful forgave him, surely we may do so too."

Dot was crying quietly. "It was cruel to tell you," she said. "Oh, my poor Tom, how you must have suffered!"

"No," he said cheerfully; "it was best, my darling. It is best always to know the truth, even if it hurts. And see what wild and mad dreams I might have gone on cherishing if I had not known; and now, if ever I am likely to grow too proud or uplifted, there's the memory of what but for one man's generosity and one man's patience and care I might have been to keep me humble. And I've had a very jolly life," cried Tom, his young face beaming again; "the Doctor has been as good as two fathers. And haven't I had Will for a friend, and haven't I Dot?" He gave a hand to each. "And now, he went on vigorously, "that bit of my story is done with. Alnaschar has smashed his crockery and come to his senses, and we arrive at the second volume of this romance, of which, if you please, I am no longer the hero."

"What, have you more to tell?" said Will, clearing his throat, and speaking with a well-feigned briskness to hide some stirred feeling. "He's not such a bad detective, after all, is he, Dot?"

"The detective is coming on the scene. When the doctor and I had ended our talk—we talked a long time—he gave me a bundle of papers, which came into his possession at my mother's death, when he undertook the care of me. He hadn't read them, he said, and he made as though such sentimental stuff as old love letters wasn't much in his way. You see," said Tom, simply, "it couldn't have been very pleasant to him to read another man's vows to the woman he had hoped to marry, or, at least, had loved."

"Were they love letters, Tom?" asked Dot, who had a lively interest in this species of literature.

"Yes, and very good ones. I read them last night when you were out, Will."

"That accounts for the conflagration. Our landlady was on the point of sending for the firemen, Dot, when I arrived in the nick of time to extinguish the flames."

"Stuff!" said Tom, laughing. "Yes; it's true I burned them. Old letters are best dead with the people who wrote them, but I'm glad I read these, for they seemed to justify my mother's choice. The man who wrote them had his better side, and he kept it for her. I burned them all but one—not a love letter, not even, properly speaking, a letter at all, but only the fragments and remains of one. I don't know how it came to be among those others."

He slowly drew a long, narrow-shaped envelope from his pocket. It was addressed in a woman's writing—"To Dr. H——." He had scored out the name, but across the paper in another and a bolder hand was written—"Received from Mrs. Smith, June the 17th, 18—."

Tom held it out, and the other two drew near and looked at it.

"Well?" demanded Will.

"That endorsement is in my father's writing," said Tom; "the same hand that wrote the letters wrote this. And you notice the date. I think we're justified in concluding that the date refers to the fragments of paper inside."

He drew the enclosures out—two frayed and soiled portions of an old letter. The ink had faded and the folds were worn as if they had been carried in a pocket and frequently read. The larger portion of the letter had been lost or destroyed. There was, therefore, no sequence or logical coherence in the sentences that were left, and yet to any one who had the clue they were significant enough. The top line, evidently the conclusion of a sentence that had gone before, ran thus—

"For my child's sake, upon your charity as a humane man and a servant of God. You have known me as Alice Smith, and as Alice Smith I wish to be buried in a forgotten grave."

The second fragment contained these words—

"If the time should ever come when he may claim the shelter of his mother's early home.—Avisia Hallett."

The brother and sister read these words in silence, then, still without speaking, they gazed at Tom.

"Tom," said Will at last, and he spoke solemnly, "you have made a great discovery."

"A queer discovery, but I'm not sure yet whether it can be called a great one. That remains to be seen. But it's odd that it should have been my father that this poor girl appealed to, and it seems to give me a sort of double claim to hunt up the missing man. Let us suppose my father's authority devolved on me and I've more than a nominal right, it comes in its way to be a duty."

"But, Tom dear," said Dot, shrewdly, "there is no address on this letter; it has been sent by hand, and there is not even a post-mark to guide you, and there are so many doctors in England."

"You forget, Dot, that if it was, as I believe, my father to whom this appeal was made, it will be an easy matter to find out where he was at that date; indeed, Rose has told me already, and if I haven't told you, my dear, it is only —"

"I know, dear," she said, softly; "I would rather never be told."

"It was before his trouble," Tom sighed, "so you see that difficulty is wiped away."

"Have you any reason to think that her appeal was answered? Is there anything in the letters to lead you to think that he took an interest in the child?" It was Will who spoke.

"Nothing at all. The letters, you see, are of an earlier date, and so they have no bearing on this inquiry, but I've reason to believe that the opportunity never came when help could be given. If we succeed in tracing her, it won't be through any service my father was able to render her; he never had the chance."

Tom's voice was dejected, and Dot and Will understood that the nameless medical gentleman whom, wonderful to relate, Tom called father, must have fallen about this very time upon evil days.

"There's one thing," said Tom, "perhaps it's my duty to lay this bit of evidence before the Halletts. I suppose they ought to be told, though the clue may turn out to be worth little."

But his companions immediately protested.

"I believe," cried Dot, her eyes shining, and her cheeks burning, "that Andrew Hallett would —oh, I don't know to what wickedness he wouldn't stoop. He is a bad man! He wants the money all for himself, and he is making that poor Miss Kelynge think he cares for her. It's shameful! You mustn't tell him, Tom."

"You know, Dot," said Tom, with a twinkle in his blue eyes, "we might claim the reward and set up house on it; not Hallett Place, my dear, but the little house we've always hoped for and looked forward to. It's a very respectable sum, and it would buy our chairs and tables, our pots and pans, our teapots and dusters."

"As if you would take it," she said superbly. "No, Tom, you must find him all by yourself. If anybody is to be told it must be Hester; it would make her so glad, and she would keep our secret."

"Well, I confess I'd rather like to try my hand at ferreting out the mystery. Of course, in any case the Halletts would have to know before the year was out; but if I could unearth the fellow myself, it would be a kind of compensation for all the grudging thoughts I've spent on him."

"Nobody must know," said Will, sententiously. "Your cousin would only laugh at you for your pains, Tom, and you say he can give you no help."

"I think not; he does not know of the existence of this paper, you see."

"Very good, then we needn't enlighten him; and I think it would be as well"—Will spoke with an effort—"not to tell Miss Hallett either at present. You see, you've very little to go by as yet. The first step is to discover the birth registration."

"That may not be so easy; registration was voluntary in those days, remember."

"You've got to prove the boy's birth, anyhow; the law won't recognise him till you do."

"It's a lifetime ago, almost before our day; still, I'll have a try before I throw the brief up. But the first step of all is to get to the place, and that must wait till an off day comes round, for it's a goodish bit from here."

They did not ask him where it was; they respected his silence, that sad silence in which he mercifully wrapped his dead father's secret. Perhaps they knew, and he knew, that it could not long be hid; but not by a look or word of theirs would they add to his pain. It was to be for them henceforth as if he had never told them, as if he were still the Tom about whose past and future they had woven so many dreams, all of them to end in a delightful surprise, as though the days of fairyland had come back again.

"I'll go shares in the funds," said Somers, getting up and shaking himself; "we'll make a joint-stock business of it—the Hallett Fortune Company. I would cheerfully sacrifice half a year's screw to out-manœuvre that fellow Hallett junior, and when the other Hallett is found I'll send in a bill of expenses to the estate, 'for recovering of lost heir,' etc. I'm not so squeamish as you or as Dot; I'll get my pots and pans out of him."

"I've some money, Tom dear, some that I don't want at all." Dot was pressing her little purse into his hand. "You must take it, Tom; indeed you must; I can spare it quite well."

Tom looked down on her in smiling refusal, and Dot looked up at him with the tears in her bright eyes. She could not tell him—and yet she told him eloquently enough—that he was the noblest, and bravest, and best of men, and that she would rather a thousandfold be poor with him than rich beyond compare with any other.

There were other pairs of lovers walking in that green Eden, but was any girl there so blessed as she?

# BROWNING AND TENNYSON:

## THEIR LATEST POEMS.[1]

FEW coincidences in literary history have been more striking or affecting than the publication of Mr. Browning's last volume on the day before his death. The aged poet lived just long enough to learn by telegraph of the instant and enthusiastic greeting which his work had received; and with words of congratulation in his ears he passed tranquilly away to the world of realities. Hardly, again, had we time to feel the full sadness of the announcement, when another volume was put into our hands, the latest work of a yet older poet—the octogenarian Lord Tennyson. Irresistibly there leaped into memory the Bible phrase—"They shall still bring forth fruit to old age;" and such fruit it is, for aroma and beauty, as grows nowhere else, in these days of ours, on English poetic garden-ground!

We do not enter on any such unprofitable task as that of drawing comparisons or contrasts between the two poets. Unlike in many respects, they are one in their keen sense of the invisible, their longing to pierce the veil of outward circumstance, and to discern what lies beyond the golden haze and smoke of conflict which by turns hang over this world. Without being *religious* poets, in the sense in which that phrase is generally used, they have in no uncertain voice given utterance to the spirit of Faith. Nor need we go back for illustration to the "In Memoriam" of the elder poet, or to the "Saul," "Christmas Eve and Easter Day," and "A Death in the Desert" of the younger. It is more to the purpose to note how in their latest works the spirit of confidence and hope appears. The words which close Tennyson's volume have already been taken to the heart of multitudes. What could be happier, or more beautiful, than such anticipated farewell to "the shore"!

Sunset and evening star,
And one clear call for me!
And may there be no moaning of the bar,
When I put out to sea,

But such a tide as moving seems asleep,
Too full for sound and foam,
When that which drew from out the boundless deep
Turns again home.

Twilight and evening bell,
And after that the dark!
And may there be no sadness of farewell,
When I embark;

For tho' from out our bourne of Time and Place
The flood may bear me far,
I hope to see my Pilot face to face
When I have crost the bar.

Nothing so touchingly personal occurs in the last poems of Browning. And yet amid all his subtleties and fancies there runs a kindred longing to "see the Pilot face to face;" only in his case it seems chiefly the discernment of the Truth on which his soul is set. He would "see God," for the interpretation of life's riddles: the passion for truth to him is more than bliss, more than poetry. Very significant is the Prologue to the poems. It is dated from "Asolo" only the sixth of last September. Asolo will be remembered by the readers of "Pippa Passes" (1842), the earliest poem which revealed to the discerning that a great poet had appeared among us. How fresh was the charm! How profound the meaning! Now the poet plays with the name of the lovely little town on its hill-side overlooking the Venetian plain, giving it a new etymology: "Asolare"—as if "to disport in the open air, amuse oneself at random." One is thus prepared for random songs, the amusements of leisure moments; and such there are, undoubtedly, in the book. But before them this Prologue stands, prefacing all the poetry by the old lament—so familiar in Wordsworth's Ode on the "Intimations of Immortality," although it is there set in another key—that "there hath past away a glory from the earth." The old age of the poet is sad, writes Mr. Browning:

The Poet's age is sad: for why?
In youth, the natural world could show
No common object but his eye
At once involved with alien glow—
His own soul's iris-bow.

And now a flower is just a flower:
Man, bird, beast, are but beast, bird, man—
Simply themselves, uncinct by dower
Of dyes, which, when life's day began,
Round each in glory ran.

We know how Wordsworth finds compensation in deeper sympathy with the human heart, "its tenderness, its joys, and fears." But this alone cannot content Browning. He faces the question whether it is not better that the glowing illusions of fancy should pass away, and things be seen in their bare simplicity.

Friend, did you need an optic glass,
Which were your choice? A lens to drape
In ruby, emerald, chrysopras,
Each object—or reveal its shape
Clear outlined, past escape,

The naked very thing?—so clear
That, when you had the chance to gaze,
You found its inmost self appear
Through outer seeming—truth ablaze,
Not falsehood's fancy-haze?

Yes, Asolo is very beautiful—beautiful as when

[1] See article "The Brownings." "Leisure Hour," July, 1883: p. 396.

Pippa sprang from her couch on that bright spring morning so many years ago, and pondered the words of her morning hymn:

> All service ranks the same with God:
> If now, as formerly, He trod
> Paradise, His presence fills
> Our earth, each only as God wills
> Can work—God's puppets, best and worst,
> Are we: there is no last nor first.

But in that day the scene to which, an unconscious angel, his heroine went forth, was irradiated to the poet's eye as with the fire of the Burning Bush. Now the flame is gone: Nature appears in her simplicity. What then? For the splendour of the revelation, dazzling the eye and soul, there is a Voice, distinct to the ear of faith. And the transition from that early glamour to the calm apprehension of spiritual realities is no less than to pass from Nature to God.

In this spirit the chief poems of this volume are written. They are full of spiritual insight. Human motives stand revealed, both in their glory and their baseness. The subtle windings of character and conduct are explored, now with intense and manly sympathy, and now with indignation, under the mark of a sardonic humour. No doubt the author is at times obscure; but enough has been said already by innumerable critics upon this point. Browning often wrote, as has been said, "in shorthand:" the reader has to supply the links which, like vowels, make the consonantal roughnesses read smoothly. If dramatic—and this is one of his great characteristics—he is not concerned to describe scene, place, time, or to indicate the interlocutors, much less to reproduce their forms of speech. He knows what is in their minds, discerning their secrets in a very startling way! The play and movement of thought are essentially dramatic; but the words are Browning's own. In a word, Browning must be studied; and true poetry demands study, like all else that is true and deep. When his meaning is discerned it is lucid as the light of heaven.

Some of his verses have an exquisite glow of passion, as in brief beautiful love poems, which seem to us a far-off response to the "Sonnets from the Portuguese;" sometimes he is daringly frank, as in his arguments (which will scarcely be thought conclusive by those most concerned) at one time against vivisection, and at another against the cruel follies of fashion. Whatever his topic, the poet's anxiety is to reach to the truth of things, and to obtain through the mists of circumstance clear glimpses of the Divine beyond. To this reality he holds, and is in the deepest sense an optimist. To quote his "Pippa" again:

> God's in His heaven—
> All's right with the world!

In the fine Epilogue to "Asolando"—so pathetic to the reader now!—the poet claims, and with full warrant, to be:

> One who never turned his back, but marched breast forward,
> Never doubted clouds would break,
> Never dreamed, though right were worsted, wrong would triumph,
> Held we fall to rise, are baffled to fight better,
> Sleep to wake.

The relations of infinite power with infinite goodness are to him a theme full of fascination; and in his "Reverie," one of the longest and finest poems in the volume, he gives full expression to his thoughts and hopes:

> I know there shall dawn a day—
> Is it here on homely earth?
> Is it yonder, worlds away,
> Where the strange and new have birth,
> That Power comes full in play?
>
> Is it here, with grass about,
> Under befriending trees,
> When shy buds venture out,
> And the air by mild degrees
> Puts winter's death past doubt?
>
> Is it up amid whirl and roar
> Of the elemental flame
> Which star-flecks heaven's dark floor,
> That, new yet still the same,
> Full in play comes Power once more?
>
> Somewhere, below, above,
> Shall a day dawn—this I know—
> When Power, which vainly strove
> My weakness to o'erthrow,
> Shall triumph.

But of this triumph where are the signs? We cannot follow the poet through all the changeful moods in which he ponders the great question. The individual life is to him a parable, intimating, but darkly, the secret of the universal scheme.

> Even as the world its life,
> So have I lived my own—
> Power seen with Love at strife,
> That sure, this dimly shown—
> Good rare, and evil rife.

But from facts such as these there is a way, direct, to Faith; and Faith discerns the end. So the "Reverie" concludes:

> I have faith such end shall be:
> From the first, Power was—I knew.
> Life has made clear to me
> That, strive but for closer view,
> Love were as plain to see.
>
> When see? When there dawns a day,
> If not on the homely earth,
> Then yonder, worlds away,
> Where the strange and new have birth,
> And Power comes full in play.

It must not, however, be supposed that all the

poems are abstrusely speculative. The reverie is but a transient mood, and our poet, with assured step and genial comment, re-enters the world of men and women. The Italian priesthood, in its various phases of character, fascinates him much; but we must refer the reader to the volume itself for the weird horror of "The Cardinal and the Dog," the scathing satire of "The Pope and the Net," the grim drawn-out humour of "Ponte dell' Angelo, Venice," with the charming simplicity and profound meaning of "The Bean Feast." The sister arts of painting and music suggest two poems of lighter touch—"Beatrice Signorini" and "Flute Music with an Accompaniment." "Rephan," founded on a story by Jane Taylor, of Norwich, is again of a higher strain. The picture is of life in a star, where life is complete, full-rounded, uniform; "nowhere deficiency or excess"—a world without defect, growth, or change:

> No hope, no fear: as to-day shall be
> To-morrow: advance or retreat need we
> At our stand-still through eternity?
>
> All happy: needs must we so have been,
> Since who could be otherwise? All serene:
> What dark was to banish, what light to screen?
>
> Earth's rose is a bud that's checked or grows
> As beams may encourage or blasts oppose:
> Our lives leapt forth, each a full-orbed rose.

With great power it is shown how the soul at length rebelled against this monotonous perfection, yearning for "difference in thing and thing," with the sense of the Infinite above and below, and the longing to aspire and to strive. So the moral is drawn that earth, with its struggles, inequalities, and opportunities, is a better dwelling-place for the soul than the star Rephan!

Browning, we say, was essentially an optimist. We can hardly assert the same with equal assurance of his great brother poet. True, on the whole Tennyson is not unfaithful to his early vision of the

> One far-off Divine event
> To which the whole creation moves.

And yet he seems at times bewildered, almost disheartened, by the distractions of the Present. The terrible series of contrasts in the poem entitled "Vastness" tend to leave the mind in doubt as to where lies the true and lasting Power. The rival forces of the world rage in ceaseless conflict and agony, until the poet asks, "What is all of it worth?—

> What the philosophies, all the sciences, poesy, varying voices of prayer?
> All that is noblest, all that is basest, all that is filthy with all that is fair?
> What is it all, if we all of us end but in being our own corpse-coffins at last,
> Swallowed in Vastness, lost in Silence, drowned in the depths of a meaningless Past?
> What but a murmur of gnats in the gloom, or a moment's anger of bees in their hive?

That tremendous *if* suggests the answer to the sceptic's passionate demands. Yet the poet rather hushes the question than meets it; or finds his only answer in the assured permanence of *human* affection:

> Peace, let it be! for I loved him, and love him for ever; the dead are not dead, but alive.

So in a tone very different from that of philosophic optimism, and yet with a yearning to reach the same conclusion, the poet's spirit repeats its ancient utterance:

> I cannot understand; I love.

A characteristic illustration of the difference between Tennyson and Browning is in their respective treatment of classic story. The former takes from the Greek mythology the topic which gives its title to the book, and with wonderful richness of imagination and felicity of diction describes the search of the bereaved Demeter for her Persephone, with the partial restoration of the daughter to the field of earth, and the hope of the great "Earth-Goddess" for the complete emancipation of her child from the realm of darkness. The old myth is exquisitely wrought, with the genius and skill that in the time past gave to the world "Tithonus" and "Œnone." The poet's own application of the myth we do not here discuss; it must suffice to give one passage, descriptive of the mother's search. It is truly Tennysonian, and shows Tennyson almost at his best.

> Child, when thou wert gone,
> I envied human wives, and nested birds,
> Yea, the cubb'd lioness; went in search of thee
> Thro' many a palace, many a cot, and gave
> Thy breast to ailing infants in the night,
> And set the mother waking in amaze
> To find her sick one whole; and forth again
> Among the wail of midnight winds, and cried,
> "Where is my loved one? Wherefore do ye wail?
> And out from all the night an answer shrill'd,
> "We know not, and we know not why we wail."
> I climb'd on all the cliffs of all the seas,
> And ask'd the waves that moan about the world,
> "Where? do ye make your moaning for my child
> And round from all the world the voices came
> "We know not, and we know not why we moan."
> "Where?" and I stared from every eagle-peak,
> I thridded the black heart of all the woods,
> I peer'd thro' tomb and cave, and in the storms
> Of Autumn swept across the city, and heard
> The murmur of their temples chanting me—
> Me, me, the desolate Mother! "Where?"—and turn'd,
> And fled by many a waste, forlorn of man,
> And grieved for man thro' all my grief for thee,—
> The jungle rooted in his shatter'd hearth,
> The serpent coil'd about his broken shaft,
> The scorpion crawling over naked skulls;—
> I saw the tiger in the ruin'd fane
> Spring from his fallen God, but trace of thee
> I saw not; and far on, and, following out
> A league of labyrinthine darkness, came
> On three gray heads beneath a gleaming rift.

"Where?" and I heard one voice from all the three:
"We know not, for we spin the lives of men,
And not of Gods, and know not why we spin!
There is a Fate beyond us." Nothing knew.

From all this wealth of poetry we turn to Browning's memorial of classic times. His blank verse is headed "Imperanti Augusto natus est——" The meaning of that expressive blank appears at the close in one electric outburst. But meantime we have no fair and lovely myth—only an enumeration, in talk between two Romans at the bath, of the mighty deeds of the Emperor, and his proposed deification. It is all very real, and most powerfully drawn. Then there is a contrasted glimpse of the great Augustus playing the mendicant for one day in the year, if so to avert malignant Fate; with another picture, of some conqueror on his triumphal day entering Rome, while the attendant on his car, holding in one hand the crown, with the other points to the emblems of shame and torture at his foot. "Crown, now—Cross, when?"

Who stands secure? Are even Gods so safe?
Jupiter, that just now is dominant—
Are not there ancient dismal tales how once
A predecessor reigned ere Saturn came,
And who can say if Jupiter be last?
Was it for nothing the grey Sibyl wrote,
"Cæsar Augustus regnant, shall be born
In blind Judæa"—one to master him—
Him and the universe?—An old wife's tale?

For these last four lines the whole poem was written. The "Sybil's" prophecy casts its reflex light on the splendid delineation of the world's power at its greatest. The careless, merely speculative way in which the prediction is flung out in passing enhances the impression; and as the Romans, finishing the dialogue, lightly turn away to their bath, they leave us with an awe-stricken sense of the spiritual might that shall be supreme over all world-power and greatness, whatsoever it may be.

Both these volumes are rich in *anecdotes*, if we may call them so—incidents and brief sketches from human life, often fraught with interest and pathos. To some of these in Browning's volume we have already referred. We might add the richly humorous "Muckle-mouth Meg," and the intensely interesting poem "Development," which may be taken either as an autobiographic reminiscence, or as a wisely profound poetic essay on Education. Tennyson, in his "Romney's Remorse" and the "Leper's Bride" chooses subjects almost too painful for art, while we admire the consummate skill with which the two distinct phases of wifely devotion are depicted. Romney "married at eighteen, and because Sir Joshua and others had said that 'marriage spoilt an artist,' almost immediately left his wife in the north, and scarce saw her till the end of his life; when old, nearly mad, and quite desolate, he went back to her, and she received him, and nursed him till he died." Equally thrilling in another way is the story of the leper's wife, who dedicated her life to the tendance of her husband smitten by the most loathsome of diseases.

This wall of solid flesh that comes between your soul and mine
Will vanish, and give place to the beauty that endures—
The beauty that endures on the Spiritual height,
When we shall stand transfigured, like Christ on Hermon hill,
And moving each to music, soul in soul and light in light,
Shall flash thro' one another in a moment as we will."

"The Ring," dedicated to Mr. Russell Lowell, is a "creepy" ghost story. "Merlin and the Gleam," in a new and somewhat jerky metre, is a mystic reminiscence of the old Arthurian world: and, if we may end our enumeration at the beginning of the book, the Dedication to Lord Dufferin, exquisitely wrought in the old "In Memoriam" metre, recalls the death of the poet's son Lionel on his way home from India:—

A soul that, watched from earliest youth,
And on thro' many a brightening year,
Had never swerved for craft or fear,
By one side-path, from simple truth;

Who might have chased and claspt Renown,
And caught her chaplet here—and there
In haunts of jungle-poison'd air
The flame of life went wavering down.

Such utterance of the father's heart adds preciousness to the poet's work, and the volume—may it not be the last!—is one to be cherished, with the companion volume of the brother poet, above all the literary gifts which Christmas brought to our favoured generation.

It is not without sadness that we close the books, and ask from what quarter we are to expect the highest poetry of the future. Is it to be, as some late examples lead us to fear, all sensuous and passionate, heathen in its religion and pessimistic in its philosophy? Or is Tennyson's half-humorous surmise (in his poem "Parnassus") to come to pass, that the chief Muses of the future shall be "Astronomy and Geology"—Science overtopping all the rest, and allowing no glimpse into grander, more spiritual realms? If so, then evil times are upon us. But on this topic we will also be optimists. Though we see not the quarter whence a true poetic light may arise, that light will not fail. If we may reverently put our anticipation into Bible words, God will not leave Himself without witness. For such witness, we cannot but believe that the popular mind is increasingly prepared. Surely the vast and sorrowing crowd which thronged the Abbey on Mr. Browning's funeral day meant more than a tribute of admiration to the poet's genius. Half unconsciously, perhaps, they gathered around his grave as that of one who had pointed them to realities beyond the sphere of sense; and in the unspoken thoughts which thrilled the spirit of the multitude there was recognised the truth that He who once revealed Himself by the Prophets of old has still a message by His poets to the ear and heart of mankind.

S. G. G.

# THE SOVEREIGNS OF EUROPE.

## THE KING OF SPAIN.

NO European country has had during the last half-century a more disturbed history than that of Spain, that country once so proud, strong, and influential in the councils of Europe, and now of so little political moment, so left behind in the march of progress. Will it and its baby monarch advance together step by step to majority? Who can tell? It is certain that the land has been in a state of fermentation for many years. It saw itself constrained to depose Queen Isabella. It could not settle down under the well-intentioned but timid and exotic rule of the foreigner Amadeo of Italy. It became after his enforced resignation the prey of rival factions, Government succeeding Government with bewildering rapidity—Republicans, Federalists, Constitutionalists, Carlists, and Alfonsists, all struggling for mastery,

In the end the Alfonsists triumphed, and in December, 1874, Alfonso, son of Queen Isabella, in whose favour she was induced to abdicate, ascended the tottering throne. Thus after six years of exile the Bourbons returned to power.

No easy post awaited this monarch of seventeen summers, called away from his mother's Christmas festivities to rule a distracted country, torn by civil war, the prey of factions. The one great legislative event of his reign was the passing of a new Constitution, a measure which annulled nearly all the benefits for progress gained by means of the previous revolutions, and which was and remains the *bête noir* of liberal Spain. It once more placed a Spaniard's liberty in the hands of the Government and, worse still, of the priests.

Hardly was this measure passed, when there arose the important political question of the King's marriage. His choice fell on his cousin Princess Mercedes, daughter of the Duke of Montpensier. But to this choice great family opposition was made. Queen Isabella had no liking for her brother-in-law, and feared the influence of Mercedes upon Alfonso. But the young King was firm, and the story of his passion and the obstacles he had to overcome recall those of Romeo and Juliet, the Capulets and the Montagues. Alas! this marriage, which was a true love match, and offered every prospect of a happy union and of a beneficial influence upon the King's life, was dissolved all too soon by the Queen's death five months after the ceremony, in June, 1878.

This death was a terrible blow to the King, and one from which he recovered with difficulty, and it was a bitter pill to him that almost immediately the question of his re-marriage had to be urged upon him, State reasons making it imperative. And it was urged with the more insistance that Alfonso's health, always delicate, began to show signs of that general breaking up of the system which led to his early death.

Ministers took stock of the marriageable daughters of royal Europe, and their choice fell upon a princess of the House of Hapsburg, a race pleasing to Queen Isabella and the Jesuits. The first meeting of the couple took place at Arcachon. When Alfonso entered the room of the villa in which his *fiancée* awaited him, his eyes fell on a fine portrait of Mercedes standing on her table. Involuntarily he drew nearer, and as he gazed on the beloved features a soft voice, half-choked with emotion, murmured at his side, "My dearest wish is to resemble her in all things, for if I must succeed her, I dare not hope to replace her."

The King did not answer, but he stayed long with the Archduchess Christina; and the next morning she received a note, written in warm and heartfelt words, in which he told her that she had wrought a miracle, touched a hidden chord he had believed silenced for evermore, and that if she consented, their union would be as much one of love as his former one.

The young Archduchess who thus understood how to touch her future husband's heart is the daughter of the Princess Elizabeth, a lady who has always been considered the most charming of the Austrian Archduchesses; she is a woman well advanced in years, and has been twice married to Austrian Archdukes and twice widowed. A special favourite with the Emperor, she embellishes the whole family life of the Hapsburgs by her wit, her physical charms, preserved even into mature middle age, and her social talents. Her children seem to have inherited some of her originality and force of character. Thus, her eldest son insisted upon making a love marriage, espousing in 1878 a daughter of the Duke Croy, a marriage without precedent in Austrian royal annals, and which caused not a little flutter, as the Prince insisted that the union should be treated as an equal one, and his wife regarded as Archduchess.

It is his sister who is the present Queen Regent of Spain. The Princess was but twenty-one when she left Vienna to unite herself to Alfonso, and had, therefore, lacked time to take any important place in Austrian society. Nevertheless, it was felt by the Viennese Court that an attractive figure departed with the Archduchess Christina, who harboured a good heart, open to noble sentiments under a pleasing exterior. Not that the Queen of Spain inherits her mother's beauty; she is rather charming, with great distinction and *chic* in gait and mien. The Archduchess Elizabeth is a tall commanding figure, with a head of the Maria Theresa type; her daughter, on the contrary, is but of middle height, fair, and gentle. At the time of her marriage her diffident bearing and look led none to suppose that she possessed a tittle of the energy that distinguishes her mother and renders her so attractive. As a young girl at Vienna, the Archduchess Christina

interested herself much in the Fine Arts, and especially in music. There was no great representation at the opera, no concert at which she did not appear, accompanied by her mother. But in public life she took no part, and was only seen on the most official occasions, when the presence of the whole royal family was indispensable. She dearly loved retirement. This and her general refinement of manner made her a great favourite with the Emperor, and he and all the family were much grieved at her departure.

The departure of the Archduchess from Vienna to join her affianced husband in Spain, where the marriage ceremony took place, was most sad. All the Archdukes and Duchesses were present; they embraced her tenderly and waved their last farewells. The Emperor could not await the departure of the train: his emotion was too much for him. As for the bride herself, her eyes were red with tears, and only sadness was to be read upon her face. Had she perchance a presentiment of the hard destiny that awaited her? And that makes it doubtful whether to her can be applied the famous saying, "Tu, felix Austria nube."

The marriage was celebrated with much pomp at the old sanctuary of Atocha, the King meeting his bride as soon as she touched Spanish soil.

For some while after her arrival at Madrid, it seemed uncertain what place the Queen would take in the Spanish Court and in Spanish hearts. For her subjects she had one great defect: she was not a Spaniard, an unpardonable sin in the eyes of this proud people.

Coming from a Court mediæval enough in tone, but yet not quite so far behind as that of Castile, Queen Christina seemed too much a woman of the day to satisfy her courtiers devoted to the traditions of a fossil past. Another fault she had in their eyes: she was not communicative. In a land where all are expansive, Queen Christina never spoke of her inmost thoughts and feelings, enfolding herself in a dignified reserve that these expansive lighter southern natures could not understand, and hence could not pardon. They held her reticence to be conceit and hauteur; and, themselves the proudest of peoples, were deeply offended at the fact that another should possess their cherished vice.

Truly difficult for the young Queen were the first years of her married life, nor did she find much support in her husband, whose easy-going nature and frail health made him anything but a strong helpmate. For example, the Spaniards desired that their Queen should speak their stately language with purity, and Queen Christina took all possible pains to learn it. But naturally she had a German accent, that ugliest of accents in a Latin tongue. The King, instead of helping her, enhanced her difficulties, From the moment of her arrival it amused him to mislead her about the meaning of words, telling her the exact opposite of their sense, and then laughing heartily at the effect produced when she, in perfect good faith, employed them in public. He was not unkind at heart, and he was sincerely attached to her, but he was mischievous and fond of fun, and callous or unconscious of the effect his jokes often had upon their victims.

Thus the life of the young Queen at Madrid was a little sad and isolated. She had no intimates, and she was of a character too serious to prove a very acceptable member of the intimate circle round her husband. Her notions of decorum were too rigid to allow her to adapt herself easily to the gay and unconventional Spanish character. As Queen-Consort, she carefully refrained from taking a share in politics, and this the Spaniards acknowledged to her credit. She was allowed to be a good wife and tender mother, and yet the Austrian royal lady was not popular with her subjects. They had no complaints to make against her except that most hopelessly irremediable of all complaints—that her temperament and theirs were essentially different. They did not fail, however, to pay a tribute of admiration to her admirable coolness in face of the pistol of Francisco Otorio, aimed at her and her husband with a precision that made their narrow escape from death almost a miracle. Her behaviour showed she possessed a high spirit. For the rest she was nothing to them but a superbly-dressed figure on festal occasions, and when in the country a sovereign leading a quiet and homely life.

The King meanwhile, however, had learnt to appreciate more and more her true value. On every anniversary of their wedding-day he gave her a bracelet set with single stones. The last came with this note: "My soldiers bear in golden stripes on their sleeves the number of their campaigns: I want to see on your arm the record of the years of happiness you have given me."

This was but a few days before that fatal November 25th, 1885, when Alfonso at last succumbed to the consumption that had long tormented him, and Queen Christina found herself a widow with two little girls, one of whom was at once pronounced *interim* Queen of Spain until it was seen whether the child which was then expected, should prove a male. It was a situation for which history had until then presented no parallel. It was a difficult, perilous moment, too, in the life of the young widow; unpopular, out of health, she was regent for a girl-heir, in a land where only males are held of value, in a country racked with discontented factions, and with a more popular male pretender fostering dissensions. Could a frail, youthful woman steer clear of all these difficulties and preserve the throne for herself and her children? Few persons in Europe, remembering the fate of Prince Amadeo of Italy, thought it possible, and not many would have ventured to predict that this woman's hands would long hold the reins of power. The adherents of Don Carlos acquired fresh hopes; Don Carlos himself felt confident of his success. But, as is often the case in life, the unexpected, unforeseen occurred. Queen Christina, self-effacing, almost timid, the mere conventional figure of a Queen-Consort, suddenly showed herself possessed of regal qualities. The day of sorrow revealed her in a new light. Thrown by the death of her husband into a position of great and manifold difficulties, the daughter of the Hapsburgs proved

herself nobly fitted for the *rôle* she was called upon to fill.

The courage and self-devotion she displayed when, in the early days of her widowhood, she personally visited the districts devastated by a hurricane, and with her own hands distributed relief to the sufferers, won her subjects' sympathy and gratitude.

Later on she showed yet greater nerve when a young officer forgot himself so far as to speak disrespectfully of her. The insolence was perhaps part only of the arrogant demeanour the Spanish nobles are apt to display towards their rulers when they happen to be of foreign race. Such behaviour as this had led Amadeo to abdicate. Queen Christina checked the insolence at once by ordering the offender into prison and keeping him there until he was prepared to apologise, and to vow he had meant nothing of what he had said.

An instance of her kindheartedness, united to firmness, was shown when the writer Del Silvio had to be banished on account of the publication of treasonable articles. His wife, left behind in great misery, entreated his pardon from the Queen, a request which was granted. When Del Silvio presented himself before the royal lady to thank her, she asked him, in the course of conversation, how many children he had. "Six," was the reply. "That is too many," said the Regent; "share with me." And forthwith the Queen gave orders that three of the author's daughters should be educated in one of the royal colleges at her expense.

Thus things went on until, on May 17th, 1886, six months after his father's death, there was born to Queen Christina and the Spaniards a prince, the much-desired male, who from the moment of his birth deposed his sister, and was monarch of Spain. This event greatly delighted the whole peninsula. Here, then, was a legitimate sovereign—a male, and one whose tender years made it an absolute certainty that he would keep outside intrigues, while the rectitude his mother had displayed during her brief regency made it almost as certain that she would continue on the same lines until his majority, which by the Constitution is fixed at sixteen. All Spaniards resolved to accept the present state of things, and await the development of events. They were weary of civil wars and disorders, of the misery and poverty these bring in their train.

In the palace itself, that May morning of the baby's birth was a busy one. All the grandees of the Peninsula had assembled in the Royal Palace of Madrid anxiously waiting to learn the sex of the child, and availing themselves of their traditional privileges to be present on the occasion. Others less privileged had assembled in an anteroom — ambassadors, statesmen, lords and ladies in waiting, dignitaries of all sorts and kinds. At one o'clock a door was thrown open and Señor Sagasta, the Prime Minister, stepped in. He carried a silver salver, on which rested a velvet cushion covered with lace, and on this airy substance reposed a small red scrap of humanity, the much-desired male, the King of Spain "by the Grace of God and the Constitution of Monarchy," who was here for the first time presented by his Prime Minister with all form to his nobles and subjects.

The monarch did not like the ceremony at all, and his first public utterances were lusty but not melodious. The ceremony over, he was at last handed over to his head nurse, Raymunda. This woman was an Asturian, in accordance with the law that obliges all nurses of the royal family to be chosen from this wild province: perhaps because they are a specially healthy and loyal people.

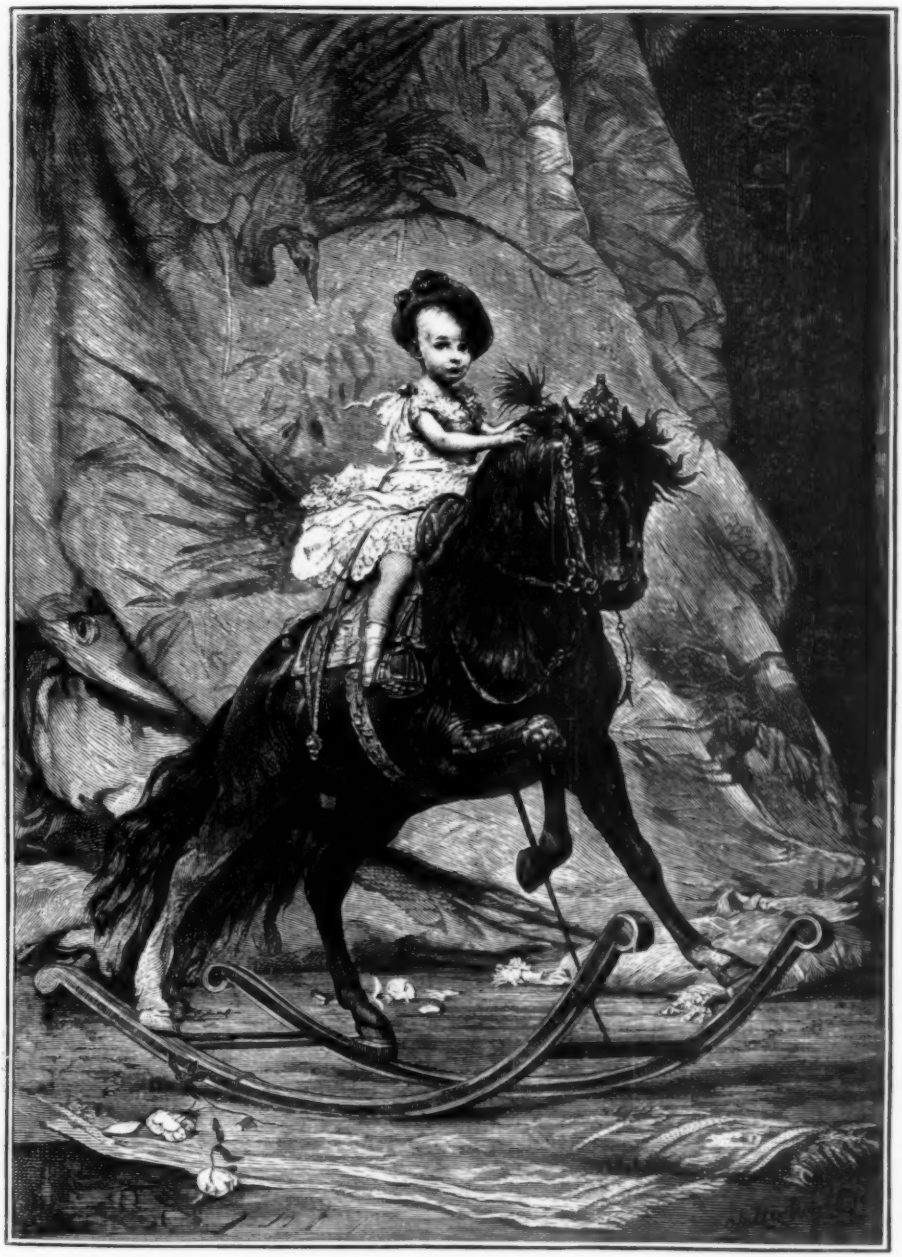
This choice of a nurse had been an anxious matter. The next was the choice of a name for the infant King. His mother desired that he should be called Alfonso, after his father, but to this great opposition was made. The late King had been Alfonso XII, this child would therefore be Alfonso XIII, and the Spaniards have all the Latin superstitious dread of that number. Many other names from the royal annals were proposed instead, but nearly all of them, like Ferdinand, Philip, Charles, were associated with bad qualities, cruelty and oppression. Queen Christina was firm, and in due time his baby Majesty was christened Alfonso. The ceremony, one of great pomp, was performed by the Archbishop of Toledo, with water specially brought from the River Jordan. The Pope, one of the godfathers, had sent a magnificent christening dress to his "well beloved son," but Queen Christina, with a woman's fondness for association, preferred that her boy should be carried to the font in the long lace robe and scarlet gold-fringed sash his father had worn at his own baptism twenty-nine years before.

Though she had now, in a measure, conquered her unpopularity with her subjects, yet Queen Christina's task had not grown less onerous since her son's birth. What could be more difficult than to rear aright a child who in long clothes already reigned as absolute monarch over seventeen millions of subjects? If it is hard to bring up a Crown Prince wisely, to save him from the evil effects of courtier adulation, false servility, distorted views of life, how much harder to educate a king, and a Spanish King withal, hedged in by all manner of ridiculous etiquette! How earnestly the Queen Regent regards her duties, how tearfully, religiously she strives to fufil them, her private letters to Vienna prove. Her one aim and desire is to bring up "the child," as she tenderly calls him, to be good, to be unspoilt, to be high-minded and patriotic. The policy she sketched for herself is indicated in the words she one day addressed to a captain-general, pointing to the cradle of the sleeping monarch, then a few months old: "My devotion to the interests of my child and my own virtue will be my shield and my guarantee of success in this, my adopted country, and in the sixteen long years that separate me from my boy's majority."

And verily she is earning the first-fruits of that policy in the general esteem of her son's subjects. On every occasion Queen Christina has shown herself possessed of unusual political intelligence,

a sense of what is due to herself as Regent for a son who, according to the national law, is King from the moment of his birth. It is this that distinguishes Alfonso's minority from that of all other European sovereigns. His mother has lent herself with unexceptional intelligence and rare national devotion to the requirements of the situation. While the King can say that he reigns but does not govern, she governs but does not reign, and her influence is supreme in the politics of a country hotly divided into inimical parties. But all these factions seem to have lost some of their fierceness, their animosity, in presence of the fair young head, the pretty winning child-ways of Alfonso XIII, and of his mother, who, notwithstanding her somewhat Austrian stiffness of bearing, shows herself possessed of a gentle and tender nature. In the midst of grandeur, she cares for simple things. She grieved at being forbidden, as Queen of Spain, to nurse her children. She delights in working for her little ones. Many tiny garments in the baby King's layette were made by her hand.

Her womanly love of children has helped to gain her Spanish hearts, as well as acts like the following: A while ago the Syndic of Madrid announced to the Queen that the name of Alfonso had been registered that day among the births for the thousandth time since the death of her husband. Deeply moved by this testimony of the sympathy of her people, Queen Christina sent the thousandth child, the son of a clerk, a complete layette—a silver cup, a case with knife, fork, and spoon, and a savings-box containing, besides a handsome nest-egg, a paper, on which was written with her own hand, "To the thousandth Alfonso, from a woman whom two Alfonsos have made happy."



Such acts, combined with the straightness of the Queen's political vision, the romance of her position as the widowed mother of a baby-king, are winning for Christina of Spain the love of her subjects. The peasant children already care for the lady whose proud bearing repels the aristocracy. Pretty stories abound among the rustic population that not unfrequently the Queen visits *incognita* the outlying cottages, bringing toys to the healthy children who can play, and various comforts to the sick, who especially appeal to her.

As a mother, Queen Christina is careful and conscientious. The royal children are strictly brought up and educated, under her own eyes, by Spanish and foreign governesses. The Princess of the Asturias and the Infanta Maria Theresa are bright, pretty girls of eight and six years old. They already speak French, German, and English, besides their native tongue. The Infanta Maria Theresa is the cleverest, but less docile, and more delicate than her sister. The Queen does not allow them to be spoilt, though the stately etiquette of the Bourbon Court obliges the attendants and courtiers to treat them with a singular attention difficult to distinguish from servility.

Of Queen Christina's determination of character Stuart Cumberland, the famous "thought-reader," gives an account in his book, "A Thought-reader's Thoughts." He writes: "I have experimented with many women of note—empresses, queens, princesses, great authoresses, artists, singers, actresses, travellers—most of them women of known strong character, but for downright concentration of thought and determinedness of purpose, I have scarcely met the equal of the Queen-Regent (Madrid). The *séance* in the Palacio Real, to which I have already briefly referred, was of more than ordinary interest, for the 'subjects' with whom I operated offered the widest psychological contrasts. Two of the most extraordinary experiments I did that day were performed with the Queen-Regent and the Comtesse de Paris. With the Queen the experiment was as follows: Her Majesty had heard that I was able by my process of thought-reading to enact an imaginary murder-scene contemplated by a person acting as my subject, and she asked me if I would give her an illustration of this character. But everyone seemed to be timorous about it, and the experiment ran the risk of not being tried for lack of a suitable subject. 'What!' said her Majesty, springing to her feet, 'can no one commit a murder? I will!' and she seized an antique paper-knife shaped like a dagger, and assumed an intensely dramatic attitude. At that moment I took her Majesty by the hand, and I felt her whole frame thrill with suppressed excitement. Her eyes were fixed and bright, and her lips drawn firmly together, and I was much impressed with the tragic force she displayed. Then came the experiment. I was blindfolded, and, taking the dagger in my right hand, I moved across the *salon*, holding her Majesty with the left hand. Presently we paused opposite a lady of the household who was reclining on a sofa. Quickly bending forward, the Queen's left hand was about her throat, and the ivory knife flashed in the light; then down it came full in the breast of the victim. A faint scream of genuine alarm from the lady, a tightening of the Queen's grasp for a moment, followed by a deep breath, and all was over. Then with a rapid twist our hands parted, and the knife was sent clattering across the room; and, lifting my blindfold, I saw her Majesty standing before me, radiant with delight at the success of the experiment. The whole thing had been most dramatically thought out and artistically executed, and all that was strong and determined in her Majesty came out in that moment."

Such, then, is the woman in whose hands lies the immediate future of Spain, which she is guiding with a skill and rectitude that contrasts favourably with the Spanish female governorship of former days. And very different is the attitude of the natives from that presented to Queen Isabella, whose reign was but another trial for that sorely tried land, which, first under Alfonso XII, and now under Queen Christina, is reviving a little from its long years of trouble and mismanagement.

The Queen certainly has no easy part to play; and chief among other difficulties is the question of the education of her son. The Clerical party will not be satisfied unless the child gets a purely Catholic education; the Liberals desire that he should have an all-round training. The one

THE KING OF SPAIN.

*From a Photograph, by Lombardi and Co., of the Painting by Professor Koppay.*

party insists that he should be surrounded by persons of all shades of thought; the other would banish from his household any person only remotely suspected of heresy, or related, however distantly, to a heretic. Another difficulty is the question of bull-fights. The Queen—and very properly English people will say—objects that her baby-boy should witness these bloody spectacles. The Spaniards, on the other hand, demand that the King should grace their gala day and their national amusements by his presence. By keeping him away his mother has offended many ardent Royalists, who contend that by such measures she is strengthening the Republican party. There is still a long, long minority to be passed during which the Queen's difficulties can but increase.

And how about the child who will, in all human probability, guide the later course of Spain? Of the character of an infant three years old little can be known; but it would seem as if he had inherited some of his father's merry temper, for the tiny fellow is lively and talkative, though at moments an expression strangely grave and far-away comes over the little face, perchance the effect of the loneliness in which naturally he must be reared, for a King of Spain can have no playmates, since he can only associate with his equals. Even from his sisters the little monarch is to a certain extent separated. From the time of his birth little Alfonso was provided with a separate household, civil and military, a number of officials, and a distinct suite of rooms. As to his appearance, he is not exactly a pretty child, but has a winning little countenance. It is quite curious to note the resemblance that exists between the little fair bareheaded King and his ancestor Charles IV. Though not stout or strongly built in body or limbs, he gives the impression of fair health.

The strict Court etiquette which permits that no one but his nurse and governess may touch the sacred person of the sovereign might some day lead to grave disaster, and may often occasion the baby needless suffering, as the following anecdote shows: A swing had been fixed in one of the King's rooms. When his baby Majesty was put into it for the first time he was frightened, and began to cry. An attendant who was standing near rushed forward and lifted the child out of the swing, little thinking he would be punished for his humane kindness. He was at once dismissed. He had touched the sacred person of an anointed King. Fortunately Queen Christina, who, although she had to yield to Spanish Court etiquette, is too sensible not to recognise its frequent absurdity, found the man another post in the palace. The King's favourite toy is a rocking-horse. He has, of course, one of the most expensive and beautiful that can be made. It is covered with the real hide of an Andalusian pony, and the saddle, stirrups, and other trappings are of the same pattern as those used in Andalusia. One of the most charming of the many pictures painted of the young King is that by Professor Koppay (a Hungarian), which represents him seated on this horse.

If the King of Spain has a worry, it is the persistency with which, since the hour of his birth, painters, sculptors, and photographers persist in reproducing his features, representing him in every attitude conceivable and inconceivable, till the child finds sitting still a torment. Perhaps no one has been more often reproduced in a brief lifetime than Alfonso XIII.

The child's life is arranged by his mother in as simple and healthy a manner as is compatible with rigid etiquette and his exalted station. Every morning, as soon as his toilet is completed he goes to the Queen, who is always eager to greet "the child." Sometimes he is present at the morning visits paid to her by the ministers or members of the royal family, listening with indifference or with merry laughter to the discussion of difficult State problems. Often during these conversations he will tap impatiently upon the table with his tiny fingers, for he is of a highly-strung temperament, and, like all susceptible people, is easily bored. He gave an instance of this at a high Church function, at which were present all the Court, the authorities, and the nobility. His baby Majesty occupied, as is customary, the first place on the Gospel side of the altar. He sat upon the knees of his nurse dressed in pure white, a coquettish white Spanish hat upon his fair little head. A learned bishop had been holding forth for over an hour amid the general silence, and his Majesty the baby had been as good and patient as possible. But as the orator meandered on and on, and there seemed no end to his flow of platitudes, the tiny King could bear it no longer. Suddenly, to the surprise and no doubt secret amusement and relief of the courtiers, he pulled off his cap, threw it on the ground, and cast a furious look at the interminable talker. History telleth not whether the bishop, on this evident sign of the royal impatience, brought his discourse to a speedy end.

It is a curious sight, which it must need Spanish gravity to bear without a smile, to see the King hold official receptions at his palace. Here, upon the throne of Ferdinand the Catholic and Charles V, sits an Asturian peasant woman holding upon her knees the little scrap of humanity that represents to the Spaniards their ruler and arbiter. On his right stands the Queen Regent, the Infantas, a few steps lower the grandees with covered heads, lower yet, on each side, the ladies and gentlemen of the Court, then lower still the military, ecclesiastical and civil dignitaries, the corps diplomatique, the Cortes, the Senate—in a word, all the high functionaries of State. And all file in order of rank and merit before this little monarch, kissing the baby hand with solemn reverence, while the baby himself is often shouting with impatience or laughing merrily but scarcely politely at some of the quaint figures that defile before him. Poor baby! these State ceremonies are a cruel trial to the patience of a lively child of three. Not seldom he falls off to sleep before these ceremonies, which Spanish etiquette prolongs more than is common, are even half ended. There is a story told that he once invited a stiff

old Court dignitary to play at horses with him, much to everybody's amusement. It is a fact that when the nobles assembled to celebrate his second birthday, Alfonso amused himself by climbing up and down the steps of his throne. Shade of Ferdinand the Catholic! do not the pranks of your descendant make you turn in your royal tomb?

The little King goes out a great deal, and of this he is very fond. His carriage is simple, and he drives without outriders or pomp, only a groom riding beside the door. Every afternoon, when the weather is fine, the royal carriage may be seen in the environs and public parks of Madrid. At five in winter and six in summer his baby Majesty returns to his palace, where he dines in State at a separate table from his mother, and with his separate suite and attendants. He has already learnt to salute his subjects in the street, and he does it in such a pretty, engaging way as to win all their hearts. He adores military music, and when he hears the people shout "Viva!" to him he claps his little hands and shouts in return.

It was a sad moment in the life of his little Majesty when it was proposed to separate him from his beloved wet-nurse Raymunda. He would not hear of it, and cried bitterly, and the woman, who loves him devotedly, cried too. At last her peasant astuteness hit upon an expedient. She taught him to say, "Nurse must stay; I command it. I wish her to stay." Before the whole Court, to the surprise of all present, the little boy slowly and gravely one day pronounced these words, after which there was nothing for it; the nurse had to stay, for what a King of Spain desires must be done, and this was his Royal Highness's first public command. But though the nurse stays on, Alfonso has passed out of her exclusive care into the charge of a Madame de Tacon, who will superintend his education, as she superintended that of his late father. Of course, he does not yet do any book-learning, but he is already being trained to speak several languages—that needful regal accomplishment.

If he lives to grow up, and if he grows up a good man, a wise ruler, unspoilt, untainted by the perilous, difficult position in which he has found himself from his birth, this will be due beyond question to the rare devotion and wisdom of his mother, to whom he is the very apple of her eye. So much can be said for this baby King—he has already in his brief reign quieted many discontents, rendered less acrimonious many party feelings; his pretty childish ways, his tender infant fingers, have softened many difficulties, untied many a seemingly Gordian knot. And what Madrid swore to its widowed Queen beside the corpse of her dead husband—to be faithful and true to her in his place, the Spanish people, with few exceptions, have loyally fulfilled.

## Gordon Pasha and King John.

Ἐμοὶ τὸ ζῆν Χριστὸς καὶ τὸ ἀποθανεῖν κέρδος.—1 Phil. i. 21.

THE swarthy king sat on his gilded throne,
Belted with purple pomp: beside him stood
A chair, which any meaner man might own,
When King John nodded in a gracious mood
In stept the Pasha, and with careless air,
Assumed the seat, and sat beside the king,
As equal sits with equal, when a pair
Of boon companions sit and drink and sing.
"What means this freedom? dost thou know that I
Can kill thee with a word? I am the king."
"Of course you are, and if I die, I die
Gladly; to me death is a gainful thing."
The king sat mute. "This strange white man," thought he,
"Who smiles at death, can take no harm from me!"

JOHN STUART BLACKIE.

# THE USES OF WEALTH.

BY DR. AUBREY.

NUMBERLESS sermons have been preached and treatises written on the wise and beneficent employment of money. Yet comparatively few persons have learned to employ money wisely and intelligently for high and noble purposes, and to extract from its use all that it can be made to yield, because so few regard it as a stewardship.

How to extract the largest measure of solid and lasting satisfaction out of wealth, and how by a wise and noble use to turn it into a channel of reproductive beneficence, are problems not easy to work out. Many rich men never make the attempt. It is impossible to watch their career without being painfully impressed by the fact that they do not, as a rule, obtain during their lifetime anything like an adequate return from their wealth. It adds little or nothing to their enjoyment, or comfort, or happiness. They have not learned to make it reproductive in the highest and noblest sense. All that can be said of them is that they have added house to house and field to field, that their banker's balance has grown, and their investments have become more lucrative. But they have not extracted any real and lasting good. Beyond the empty pleasure of ownership, their money has yielded them absolutely nothing.

Better, however, than all didactic statements and formal exhortations are the illustrious instances which have been furnished in recent times on both sides of the Atlantic, but especially in America. There, owing to peculiar conditions and circumstances, immense fortunes are made—and sometimes lost—with startling rapidity. The enormous wealth imputed to a very few in the palmy days of Greece and Rome, when military conquest and commercial splendour were at their height, sinks into insignificance when compared with the riches amassed in a short time by scores and hundreds in the United States, who are described as millionaires many times told. Without being so invidious as to mention names or to specify the precise amounts, it is well known that there are among the "railroad kings," the "silver kings," the merchant princes, and the great captains of industry and enterprise across the Atlantic, men whose wealth ranges from fifty to three hundred millions of dollars, or from ten to sixty millions of pounds sterling. It is difficult to realise what this means. To speak of millions is easy enough, but the idea conveyed is indefinite. A million sovereigns placed in a straight line edge to edge would extend over more than thirteen miles. What is the potentiality of ten or of sixty such lengths?

Of course, the limit of personal enjoyment is soon reached. With the utmost capacity and desire for spending, a man can derive only a restricted measure of satisfaction. The point is soon attained where plethoric wealth ceases to minister to happiness, and becomes a weight and a care. "Having food and raiment, let us be therewith content." The trouble is that so few are willing or know where to pluck that fragrant flower. Nor have they attained to the high philosophy of using surplus riches, beyond the supply of the comforts and the reasonable refinements of life, in a manner productive of the greatest good to the greatest number. Their ambition is satisfied with being reputed wealthy while they live, and with the anticipation of being spoken of as having died like a modern Crœsus.

To such sordid souls there is no appeal. But it is refreshing to turn to those who, under a due sense of responsibility, have sought "to do good and to communicate."

The form which this has taken with wealthy and generous Americans has mainly been in the establishment of colleges and Universities, where the best tuition may be imparted at moderate cost, or absolutely gratuitously.

Nearly all the States furnish instances of this. The old and renowned foundations of Harvard, at Boston, and of Yale, at New Haven, were thus established two centuries and a half ago. Endowments given by sagacious and noble-spirited men who flourished in the early days of the Puritan settlement of New England have been largely supplemented by munificent gifts during later times. In other places, also, the fathers and founders of the American colonies displayed their foresight, their zeal for education, and their generosity by providing seats of learning for all who should come after. The buildings, the libraries, the scientific equipment, and the teaching staff of such Universities as Harvard, Yale, Princeton, and other well-known establishments will not suffer by comparison with the more ancient educational foundations of the Old World.

In like manner the pioneer settlers of some of the Western States, about the middle of the present century, and during more recent years, had the discernment and the philanthropy to reserve certain large tracts of land for schools and colleges. They foresaw that, with the influx of population, the development of natural resources and the growth of towns, the need for instruction would increase, and that the value of the lands set apart for the purpose would be greatly enhanced. Their wisdom has been abundantly demonstrated. What was prairie waste or forest twenty-five or fifty years ago is now richly fertile soil, or is the site of growing towns and cities. By the sale at an increase of a hundredfold or more the land thus reserved in early days of colonisation has yielded a fund sufficient to provide higher education in such States as Iowa, Michigan, Wisconsin, Colorado, Illinois, and

Minnesota. In other States a very small annual tax or appropriation suffices to meet the requirements, in addition to the regular school tax for elementary education.

Specific reference, however, must be made to certain institutions for higher learning which have been founded and endowed of late years by individual munificence. One group of these was specially designed for the advanced education of girls, and among the earliest of such foundations, if not actually the first, was the one established in January, 1861, by Matthew Vassar, at Poughkeepsie, on the River Hudson, seventy-five miles from New York. Mr. Vassar was a native of East Dereham, in Norfolk, where he was born in 1792. Four years later his father emigrated to the United States, and settled on a farm about three miles from the present city of Poughkeepsie. In 1801 he commenced a brewery, which was afterwards carried on and developed by his son, who, in conjunction with two nephews, built up a large business and accumulated a fortune. Having no children to inherit his property, it became a cherished purpose to devote it to some benevolent purpose. Various plans were considered and rejected, but at length it was decided to erect and endow a college for young women.

Correspondence was opened with some of the leading educators in the country, with a view to define the objects and to determine the methods. Architects were consulted; plans were submitted and carefully examined; schemes of instruction were discussed with competent advisers; and a liberal basis was laid down for the future management of the institution. Although its founder was warmly attached to the Baptist body by lifelong associations, he resolved that no one sect, as such, should have a controlling influence. When asked whether he purposed placing the college under the rule of his co-religionists, he instantly dissented. In his address to the trustees at the organisation of the Board he expressed his wishes on the point in the following sentence:—"All sectarian influences should be carefully excluded; but the training of our students should never be entrusted to the sceptical, the irreligious, or the immoral."

Early in 1860 Mr. Vassar, then nearly seventy years of age, proceeded to carry into effect his long-cherished plan, the details of which had been matured and settled. A charter was obtained from the Legislature of the State of New York. Twenty-nine persons were chosen by Mr. Vassar to constitute the body corporate of the college, and to be its first trustees and his coworkers. At their first meeting he read a statement of his views, wishes, and intentions. In it he stated his desire that the course of study should embrace the following subjects, among others: "The English language and literature; other modern languages; the Ancient Classics, so far as may be demanded by the spirit of the times; mathematics, to such an extent as may be deemed advisable; all the branches of Natural Science, with full apparatus, cabinets, collections, and conservatories for visible illustration; anatomy, physiology, and hygiene, with practical reference to the laws of health; intellectual philosophy; the elements of political economy; some knowledge of the Federal and State constitutions and laws; moral science, particularly as bearing on the filial, conjugal, and parental relations; æsthetics, as treating of the beautiful in Nature and Art, and to be illustrated by an extensive gallery of Art; domestic economy, practically taught, so far as is possible, in order to prepare the graduates readily to become skilful housekeepers; and last, and most important of all, the daily systematic reading and study of the Holy Scriptures, as the only and all-sufficient rule of Christian faith and practice."

In this preliminary statement the purpose was disavowed of making a charity school, whose advantages should be free to all without charge; "because benefits cheaply obtained are cheaply held." He added: "It is believed that the funds of the institution will enable it to offer to all the highest educational facilities at a moderate expense, as compared with the cost of instruction in existing seminaries. I also earnestly hope the funds will prove sufficient to warrant the gratuitous admission of a considerable number of indigent students annually; at least, by regarding the amount remitted, in most cases, as a loan to be subsequently repaid from the avails of teaching or otherwise. Preference should be given to beneficiaries of decided promise—such as are likely to distinguish themselves in some particular department or pursuit—and especially to those who propose to engage in teaching as a profession."

These views were unanimously endorsed by the trustees, who proceeded at once to give them effect. To enable them to do this, Mr. Vassar made over to them bonds and mortgages, certificates of stock, and a conveyance of two hundred acres of land, two miles from Poughkeepsie and the river; representing in the whole eighty thousand pounds. Steps were immediately taken to commence the college building, which was completed early in 1865. An astronomical observatory was also erected, and a spacious gymnasium and riding-school. A full staff of professors and teachers was appointed; a prospectus was issued, embodying the scheme of internal organisation and the course of study; and on September 20th, 1865, the first session of Vassar College was inaugurated with more than three hundred students.

The main edifice is five hundred feet long, with a breadth through the centre of about two hundred, and there are two transverse wings. These, with the centre of the structure, are five storeys in height, while the connecting portions have four. In each storey is a corridor twelve feet wide and five hundred and eighty-four feet long, affording space for exercise in inclement weather. The building contains six independent dwellings for the president and other principal officers; seventy-seven separate studies, two hundred and eighteen sleeping-rooms, and thirty-seven combining both purposes, for the students; numerous rooms for class recitations and lectures; a dining hall, a

chapel, and all needful domestic arrangements. A few years after the opening, the gymnasium was converted into a museum, at an expense of five thousand pounds; and it now contains the departments of natural history, drawing, and music, with their valuable collections and necessary lecture-rooms, laboratories, and studios.

Mr. Vassar died in June, 1868, while attending a meeting of the trustees of his college, and during the act of reading to them his annual address. By his will the institution was made inheritor of most of his remaining property. Three sums of ten thousand pounds were to be devoted to a lecture fund, to a library, art, and cabinet fund, and to the aid of meritorious students. A further amount of twenty-five thousand pounds was left for repairs and improvements. He had already, beyond his original gift, expended four thousand for an art gallery, and fifteen thousand for additional buildings. His nephews, both of whom have since died, also made large contributions for specific purposes; one who died only last year bequeathing thirty thousand pounds, besides making the college residuary legatee under his will; a provision which is likely to yield more than twice that sum.

Detailed reference has been made to this foundation, partly because of its extent, but chiefly because it was unique at the time. Subsequently, similar institutions were formed by generous private bequests for the education of girls. The latest returns give particulars of 159 institutions for the superior instruction of women, established in this way or by various religious bodies. They are found in thirty-two States; the pupils exceed 21,000; the value of the premises and apparatus is more than two millions sterling; and the permanent endowment funds are half a million. One of these, at Northampton, Massachusetts, was established by Miss Sophia Smith, of Hatfield, in that State. Another is Mount Holyoke Seminary, also in Massachusetts, which has just been incorporated as a college by charter. A third is the well-known Wellesley College, near Boston. In the formation of this, however, various donors participated.

The late Mr. W. H. Vanderbilt, of New York, a great railway magnate, the son of one who was renowned for his enterprise and success, founded in 1873, at Nashville, Tennessee, a University which bears his name. It has sixty-five instructors, more than six hundred students, property worth £160,000, and more than that sum as an endowment. Mr. Peter Cooper, also of New York, a wealthy merchant, who recently died there at the advanced age of ninety years, devoted a large fortune to what is known as the Cooper Institute. It comprises a spacious free reading-room, capable of accommodating five hundred persons, and supplied with newspapers from all parts of the world; an extensive reading and reference library, and numerous classes in Art, science, stenography, type-writing, telegraphy, designing, etc.

Among the most efficient institutions in the West is the one now known as De Pauw University, at Greencastle, Indiana. This was chartered in 1837, and its progress is thus summed up in the last catalogue:

"At the beginning it did not own a foot of land; now its grounds embrace one hundred and fifty acres. From a small rented building of but two rooms it now has nine edifices, most of them among the best, devoted to the purposes of education anywhere. From a faculty of four members its present staff of instructors comprises forty-one, besides occasional lecturers; with libraries, physical, chemical, and biological laboratories, and all the appliances of first-class instruction. Beginning with eighty-five students, mostly from the immediate neighbourhood, the attendance now reaches eight hundred and forty-three, from nearly all parts of the world."

Through the liberality of Mr. De Pauw and other friends, a large endowment fund was secured in 1884, and tuition has been made free in most of the departments. This is a characteristic feature in many of the great seats of learning in the United States. Students of limited means are thus able to carry on their work in many of the best colleges and Universities at a very moderate cost for board, lodging, and personal expenses only. Even these are often defrayed by scholarships gained, or by private teaching, or by service rendered to the institution, or by money earned during the long vacation.

Cornell University at Ithaca, in the western part of the State of New York, originally founded by Ezra Cornell, another celebrated name in the railroad world, has attracted much attention during the last twenty years because of the facilities supplied to both sexes for pursuing studies in almost every department of knowledge, literary and scientific. It has ninety-seven instructors, upwards of eight hundred students, ninety-five thousand volumes in its library; grounds, buildings, and apparatus worth more than £270,000, and productive funds exceeding £1,000,000. Columbia College, in the city of New York, is nearly as wealthy. The Johns Hopkins University, in Baltimore, chartered in 1867, a richly-endowed institution, stands deservedly high for the character of its teaching, especially in the departments of applied science. A new branch, pathology, has recently been instituted. A physical laboratory, the largest and costliest building yet erected on the campus, which boasts of magnificent structures, has been completed and occupied. A building has been set apart for the petrographical laboratory. An Observatory for the instruction of students in astronomy has been equipped. The laboratory is a brick building with sandstone facings. Its exterior dimensions are 117 feet by 71 feet. The cost, including land and furniture—large amounts having been previously given for instruments and apparatus—was £35,000, provided out of the endowment of £700,000 by the founder. He was a wealthy merchant and railroad pioneer. Like Vanderbilt, and Cornell, and many others who became eminent for their commercial success, he was the architect of his own fortunes, and rose from poverty to the possession of vast wealth.

Lehigh University at South Bethlehem, Pennsylvania, fifty-six miles north-west of Philadelphia, was founded in 1865 by Judge Asa Packer, who gave half a million sterling and 115 acres of land. A daughter subsequently erected a handsome church, at a cost of £6,000, and a spacious library has been built in memory of another daughter. Lehigh University comprises two schools: that of general literature and one of technology. The current calendar gives 383 students, of whom 352 are in the various departments of technology. Of these, one-third are studying civil engineering, 81 mechanical engineering, 61 mining and metallurgy, 41 electrical engineering, and 45 analytical chemistry. The standard of instruction is high, and examinations are severe. Ample opportunity for practical work is afforded in the well-equipped laboratories and museum attached to the University, and in the workshops of the Lehigh Valley Railroad, and of the Bethlehem Iron Company. The demand for the students thus trained is far greater than can be at present supplied. Growing attention is being paid everywhere through the United States to these practical departments, owing to the necessity for great structural and engineering works in the vast territory now being developed in the West.

In like manner, the science of instruction is being more and more studied, and the most approved methods are being taught. Mr. Jonas G. Clark, of Hubbardstown, organised in May, 1887, a University at Worcester, Massachusetts, for the technical and practical training of teachers. His gifts were as follows: For the general working or construction fund, to be applied to the erection and equipment of buildings, £60,000; for a library fund, £20,000; for a University, the income to be devoted to the general purposes of the institution, £120,000; in addition to real estate, a library, and a work of art estimated at £100,000. Mr. Clark further proposes to give a like sum for the maintenance of three professorships, on condition of a similar amount being provided by other persons. A complete scheme is in course of elaboration; plans are being prepared for the structure; the president and some members of the faculty have been chosen, and extensive purchases are being made in Europe for the purposes of the University. The recently-founded Tulane University, at New Orleans, has an endowment of £400,000.

Perhaps, however, two of the most comprehensive and magnificent schemes of the last few years are those known as the Lick Observatory, and the great University which Senator Stanford is establishing in memory of his only son. The former has been completed, at enormous cost, on one of the highest mountains in California, and is supplied with the best apparatus that optical science could furnish. The great telescope has a thirty-six inch objective, cast by M. Feil, of Paris.[1] Important results are anticipated from its use, and by means of the other costly and delicate instruments with which the observatory is provided. The Stanford University is also to be located at Palo Alto, in California, and its plan of general instruction and training is being carefully matured. A commencement has already been made with the buildings, and large collections are in process of formation for the library, the museum, the art galleries, and the various scientific and technical departments. It is understood that at least five millions sterling will be devoted to the carrying out of this magnificent project, and that neither expense nor labour will be spared to render it in every way worthy of the donor and the country.

[1] See "Leisure Hour," p. 691, 1889.

An announcement has just appeared that Mr. A. J. Drexel, a wealthy and munificent banker of Philadelphia, is about to establish an Industrial Institute at Wayne, near that city, at a cost of £300,000. His original purpose was to found an industrial college for girls, where they might be instructed and trained in such a way as to fit them for occupations in which they could earn a comfortable livelihood. It was at first intended to receive about two hundred girls and provide them with free lodging, board, and instruction. Accommodation was also to be furnished for about twice that number to receive daily training. After mature deliberation it was found that this scheme had several drawbacks; the chief one being the withdrawal of the girls from home influences. It was further thought that the sphere of usefulness might be greatly enlarged by establishing the proposed Institute within the city limits. It is now the intention of Mr. Drexel to purchase land and to erect buildings, and to provide adequate funds for the maintenance of a full corps of efficient instructors, so that one thousand girls may be trained in the daytime, and a like number of boys in the evenings. The Institute is to be free of all cost to the students. Its working will probably be somewhat similar to the renowned Cooper Institute in New York. A large lecture-hall, capable of seating two thousand persons, and an extensive reading-room provided with all the standard technical books and appropriate periodicals and newspapers, will be features of the plan.

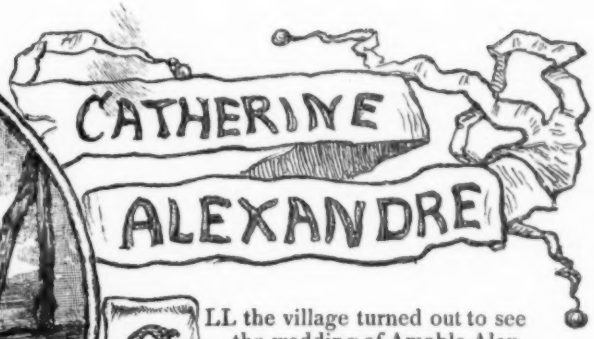
In the last report of the Commissioner of Education at Washington, returns are given from 361 Universities and colleges of liberal Arts, besides numerous schools of science and agriculture. Nearly all of these were established during the second half of the present century, and about one-half of them within the last twenty-five years. Some of them owe their origin to the private generosity of individuals; others to local collective effort; some to land grants, or to State appropriations; and the rest to the zeal of various religious communities. The same report devotes seven closely printed pages to a list of noteworthy personal gifts and bequests to schools, colleges, and other institutions of learning during the year 1886-7; being the last one for which complete returns were available. The list does not include

anonymous benefactions, nor those made by or to church societies, or aid organisations of any kind. Of the 209 gifts and bequests thus tabulated, twenty-five represented £10,000 or more; seventy-two were of less amount, but exceeded £1,000 each; and 112 were under that sum. The largest donations were: £160,000 from John Brewster for the Free Academy in Wolfborough, New Hampshire; £100,000 from Jacob P. Jones for the Haverford (Friends') College, near Philadelphia; £126,000 from E. Price Greenleaf, for the library, and for scholarships in Harvard; £47,000 from Uriah A. Boyden for astronomical stations connected with the same; £42,000 from the Rev. E. H. Gammon for a school of theology in Atlanta, Georgia; £25,000 from Samuel Ensworth, for buildings for endowment of St. Joseph Medical College, Missouri; £20,000 from Dr. W. H. Backus, for the library fund of Bucknell University, Pennsylvania; a like sum from Mrs. S. V. Hoffman, for a chapel for the General Theological Seminary, New York; a similar amount from Richard Perkins for free scholarships in the Massachusetts Institute of Technology; and one from George F. Wilson for the physical laboratory of Brown University, Providence, Rhode Island. It must be remembered that these ten gifts, amounting to £580,000, and the 199 sums below £20,000 each, aggregating nearly £400,000 more, were made during one year by private individuals for purposes of secondary and higher education.

In addition to these generous and patriotic gifts, however, there were many noble endowments and bequests for free libraries—over and above those established and maintained out of the taxes; for such unfortunate classes as the deaf and dumb and the blind; for medical schools, infirmaries, and hospitals; for work among the coloured people and among the aboriginal Indians; and for missionary enterprise at home and abroad. No collected statistics are available to show the extent and the variety of these benefactions. But they have been made on behalf of every kind of human suffering, necessity, or worthy ambition. Thus the trustees of the fund left by the late Mr. George Peabody distribute annually 114 scholarships of £40 each among ten Southern States, in aid of students in Normal Colleges. An accepted candidate must give a pledge to remain at college two years, and promise to teach at least four years in the public schools. Out of the same fund large sums are granted every year in aid of Normal Schools and of teachers' institutions. The American Missionary Association, which carries on with much energy and success a greatly-needed work among the negroes and the Indians, received last year a bequest of nearly £80,000. The American Board of Commissioners of Foreign Missions received in 1887 a much larger sum from a gentleman who, though connected with the Unitarian body, was desirous to show his sympathy with the work carried on by the American Board.

Such are some of the beneficent uses to which great wealth is being applied in the United States. Granting that, in some cases, a desire exists to perpetuate the names of the donors, and that some conditions attached to certain gifts are of questionable utility, yet, taken as a whole, the philanthropic and educational work here glanced at is worthy of admiration and emulation. Human motives are always mixed, and, after all, one has to consider the ultimate object. No impartial observer can fail to perceive that an incalculable amount of good is being accomplished, especially by the educational endowments, to an account of which the chief part of this paper has been devoted. It is peculiarly gratifying to witness in a new country, where vast wealth is being rapidly acquired, that its possessors are so often found willing to devote it to the improvement and elevation of their fellow-men. One ethical maxim, however, must always be borne in mind—that the subsequent use of money does not atone for the equivocal and objectionable methods by which it is too often acquired. In this respect most certainly the end does not justify the means.

## Night.



NIGHT comes with silent steps across the plain,
In all the gloom of sable garments drest:
Legions of dreams obey her least behest,
And clouds and darkness follow in her train.
While constellations chant their stately strain
She takes our weary earth upon her breast,
And, like a mother, hushes us to rest,
Bidding us now forget life's toil and pain.
'Tis said that morning's joy shall end the night,
The day-spring drive the darkness far away,
And new-born gladness comfort them that weep:
Let those who can, look forward to the light
And plan the pleasures of the coming day;
But I am weary—let me go to sleep.

ELLEN THORNEYCROFT FOWLER.

# THE MONTYON PRIZE.

## ITS HEROES AND HEROINES.

ALL the village turned out to see the wedding of Amable Alexandre with pretty Thérèse Lagulle, in the old church beside the poplar-bordered Canche. And everyone wished the young couple luck, for they were well liked by their neighbours. Born and brought up in Boubet, their love affairs had been watched throughout with great interest by their acquaintances—a term which included every man, woman, and child within a circuit of some miles; and so popular were they, that when, shortly before his marriage, Amable was promoted to the post of head gamekeeper by his employer, Monsieur Delorme, the chief proprietor of the neighbourhood, no one could find any objection to make to the appointment, except perhaps that Amable was young. This was true, but it was a fault which Monsieur Delorme felt time would mend, and he was glad to promote so honest and deserving a young fellow, who was, besides, one of the best shots in the department. So Amable and Thérèse were conducted, after the wedding, with much state and ceremony to their pretty little cottage in the forest; and here they began a life which promised to be one of ideal happiness and comfort.

The next year little Catherine was born, and though, perhaps, the forester would have welcomed a son even more warmly, the baby-wiles of his little daughter soon won for her very nearly all the space in his heart which was not occupied by her mother. Sometimes he would talk jestingly of the time when "the boy" would come to make the family circle complete; but in the meantime the home was a very happy one, leaving little to be desired by either husband or wife.

It was September, three years after the marriage, and Catherine was adding each day a new word to her baby vocabulary, and acquiring a fresh charm in her father's and mother's eyes. She was a chubby, golden-haired creature, quaint and pretty enough to have served as a model for any artist as she stood by her mother's side at the cottage-door, in the funny little long skirts still worn by French peasant children, and with the funny little white cap drawn on tight over her head, from which only stray locks of gold were peeping, just like one of the children in Vandyke's royal families of two hundred years ago.

Thérèse was shading her eyes from the afternoon sun, looking after her husband who was starting off to the forest, with a gun over his shoulder and a dog at his side. She looked at him fondly and proudly. "Au revoir, mon ami!" she said, and then something induced her to call him back.

"Do not be late in returning," she cried. "The evenings draw in so quickly now—and—well, you must know I got a little nervous the other day."

Amable came back and patted his wife's cheek, and then kissed it. "That is because you are not quite strong just now, *mamie*. But I am only going as far as the west coppice to see how they are getting on with the new paling, and I shall be back before dusk, anyway." Then, with a gay good-bye to little Catherine, he strode off, whistling to his dog as he went.

When the trees had hidden him from sight Thérèse came in and busied herself as usual with her household duties. She then sat with her sewing at the cottage door, and played with little Catherine; but an uncomfortable feeling of oppression was upon her. Later on she set the supper ready on the table, and when Amable did not appear as he had promised she put the child to bed and lighted a little wood fire. Then she sat down to work again, but with a curious feeling of uneasiness at her heart. It was strange he did not come, she thought, for just before dusk she had heard a couple of shots in the wood not very far from the cottage, and had made sure that Amable was potting a rabbit on his way home, and that he would soon appear.

Darkness fell; hour after hour went by; and the vague uneasiness grew into a terror which at length forced Thérèse into action. She could not sit still in the house. She lighted a lantern and looked out. All was still, except a slight rustle of leaves under the rising wind. She called, but no answer came. Presently, filled by some presentiment of coming ill, she determined to go in search of her husband, and at once turned her steps in the direction from which the shots had seemed to come. She looked, she called, but only the hoot of an owl answered her. The deep stillness of the forest was unbroken save by the occasional flapping of a bat. She hurried on—impelled, who can say, by what instinct? In ordinary times she would not have been alarmed at finding herself thus alone in the dark wood. But certain recent reports of poachers being in the neighbourhood had frightened her, and her nerves were at the moment highly strung.

The moon had risen clear and resplendent, paling the dim light of the lantern she carried, but adding by the deep shadows which it cast a fresh terror, as it seemed to Thérèse, to the scene. At last, persuading herself that her husband might have returned by another route, she was about to retrace her steps when her foot kicked against something on the sward. She stooped down. It was her husband's cap. She picked it up, and by the lantern's light could plainly see that it was stained with blood. With a wild cry, her face to the earth, and the lantern held close to it, she followed the horrible trail of blood on the down-trodden turf to the back of a clump of bushes a few yards to her right, and there the unhappy woman beheld a sight which for a time stretched her beside her murdered husband, almost as lifeless as he.

Early the next morning a passing woodcutter discovered the unfortunate pair, the half-unconscious and distracted wife clinging with desperate tenderness to the clay-cold body of her husband, and still striving to chafe some warmth into his livid lips. The dog which had accompanied Amable was found shot dead near by.

The unhappy Thérèse was carried home, more dead than alive, side by side with the corpse of her husband; and before that terrible day was over the son to whose advent so many hopes had been directed was born—a poor, puling little creature, whose cry seemed to have in it something of an eerie sound.

It was thought at first that the boy, born in such terrible circumstances, could not be reared; and many among the widow's acquaintances openly said that it would be a mercy if the *bon Dieu* would rid the poor mother of the burden, since it was evident that the child was not *right*. But the mercy thus considered so desirable was not vouchsafed, and indeed the more uncanny poor little Nicholas grew the more tenderly did his mother cling to him. Curiously enough, it was a very long time before Thérèse found out that anything was amiss with her darling.

He grew fairly well, and she was proud to exhibit his strong, unshapely limbs, and laughed over the curious efforts which he made to express his wants long after the time when he should have been talking intelligibly. At length, however, as she compared him with other boys of his age who were already finding their way to school, primer in hand, she began to grow uneasy. She spoke to Monsieur le Curé as to the child's backwardness, and, by his advice, even consulted the doctor at St. Pol. Neither one nor the other liked to crush the poor mother's heart at one blow with the terrible verdict which village public opinion had already pronounced; but there could be little doubt that both held the same view. The doctor gently suggested that it would be well to seek admittance to some asylum for—well, for children who required special care and attention; but this idea the mother rejected with some indignation. Whose care, she demanded, could be better than her own?

Monsieur le Curé proposed a pilgrimage to the shrine of St. Vaast at Arras, and at the same time presented poor Thérèse with a little book of devotion, in which a bit of blue ribbon marked the page "Resignation." Thérèse accepted the idea of the pilgrimage, lighted a wax taper at the shrine, and promised St. Vaast a wreath of wax flowers if Nicholas should be able to talk in a twelvemonth from that date. But St. Vaast never got his wreath, and Thérèse's little book became thumb-marked and worn at the page where the soiled blue ribbon still pointed to the title "Resignation."

Poor Nicholas, as time went on, became more and more hopelessly imbecile. At seven he was a big, awkwardly-built boy, with arms much too long for him, and hands which had not yet learned the simplest use to which they could be put. His head, also large in proportion to his body, rolled about heavily like that of an infant, and his tongue lolled out of his mouth like a dog's. The sounds which he made, though never approaching to words, were loud, and he had the power of showing great anger and excitement when crossed or irritated in the slightest degree. It is not too much to say that these fits of passion were never caused by his mother, who indulged him in every possible way, and, indeed, devoted herself entirely to his service. No doubt it would have been better for the child himself had he at this early stage been forced to some

sort of self-control and discipline, but in the treatment of the mentally afflicted there seems to be no sense of moderation in the peasant mind. The poor sufferer is either regarded with the most abject terror and aversion, or he is pampered and indulged to an extent which would be the ruin even of a sane person. And this was the case with Nicholas.

At fourteen his condition was clearly worse than at seven. His animal instincts had developed, but his mind had made no progress whatever. He was wilder, more irritable, less amenable to control, and, if anything, less intelligent. The only things which seemed to give him any pleasure were running, leaping, jumping—and eating. His appetite was enormous, and the only intelligible sounds which he made were in demand of food. He had learned to convey things to his mouth with his fingers, and could even be occasionally induced to use a spoon. He would never sit on a chair, but crouched on the floor, and liked nothing better than to gnaw a bone like a dog. At some times he appeared to be less sane than at others, and during his worst attacks it was difficult to keep him even decently clothed, since he would tear everything off him, as though each link which bound him to humanity were repugnant to his nature. Degrees of heat and cold affected him but little. He would choose the hottest days of summer for his mad careers over hill and dale—a terror to all who saw him. He would sleep through the coldest nights of winter covered only by a rug, since he habitually disdained the use of a bed.

Meantime, Nicholas was becoming an object of intense aversion, and even unreasoning terror, to his neighbours; unreasoning because he was, in truth, up to this time absolutely harmless, being himself in mortal terror of strangers, and rushing away to hide himself if any one so much as approached him.

But there is an old superstition still obtaining in the remoter rural districts of France that imbecile persons are possessed by the devil, and that, even when apparently harmless by day, they have by night the power of assuming the form of any wild animal they choose. They are known by the name *loup garou*, and hundreds of instances are on record in the old judicial history of France in which unfortunate lunatics were solemnly tried for this offence, and punished with death. In some cases they gave evidence against themselves, explaining the manner in which the enemy of mankind appeared to them nightly, and assisted them in their transformations. In the year 1521, for instance, we find that two men, named Burdot and Verdung, made a most detailed confession of these diabolical appearances before a commissioner specially appointed to inquire into cases of the kind. These are some of the answers given. "I could feel myself taking the form of a wolf. I walked on four feet. My limbs became suddenly covered with long hair. I ran with the swiftness of the wind, being pushed along against my will by the power of the devil. I was so overcome by fatigue after these excursions that I could hardly stand. I do not know what becomes of my wolf's skin when I resume my human shape."

It is needless to say that such terrible depravity was punished by a lingering death at the stake!

But in spite of such an example, the offence was constantly being repeated, and fifty years later the Parliament of Franche-Comté, which district of France seems to have been specially annoyed by the vagaries of its imbeciles, issued a decree for the hunting down of all *loup-garoux* within its borders.

Civilisation has other methods now of dealing with insanity and hysteria; but among the uneducated classes the old name and the old terror still linger.

It somehow leaked out that the unfortunate Nicholas could not be induced to go to his bed like other Christian people, and at once the rumour got abroad, gathering in distinctness and circumstantial detail as it spread, that the wretched lad was a *loup garou*. Shortly afterwards a child was reported to have had a fit after seeing him rush by in one of his wild spasms; and the parents of another child who died in the village did not hesitate to affirm that the *loup garou* had bewitched him. All this made life very hard for poor Thérèse, who now, from being an object of affection and interest to the people among whom her life had been passed, found herself regarded on all sides with a certain aversion.

At length the curé of the village spoke to her. Would it not be better, he suggested, to send Nicholas away to some asylum, since it was now evident that his case was hopeless? He was a terror to the neighbours, and as he grew older he could only be a greater burden and anxiety to his mother. But to this the widow had but one answer—the *bon Dieu* had sent the child to her—to her and to no other—and what was she that she should rebel against the gift of God, and turn it from her doors? If, she pathetically added, her poor boy was a trouble and a scandal to the village, she could remove from it. She could give up her home, but she could not give up her child.

Since Amable's death Thérèse had occupied a small cottage in the centre of the village, which had been granted her rent free by the proprietor, Monsieur Delorme, together with a tiny pension, as some compensation to the widow for her husband's tragic end. She now, under pressure of this neighbourly persecution, proposed to leave the little dwelling for a more distant one; and, speaking to the curé again on the matter, she begged him to use his influence with Monsieur Delorme to obtain for her a lonely and ruinous hut situated about half a mile from Boubet, on the road to St. Pol, which had long been uninhabited.

"My daughter," said the good old curé, when Thérèse made this request to him, "I do not at all like the notion of your living quite alone in so desolate a place with only that—that unfortunate lad for company. You would be quite away from all help."

Monsieur le Curé had known Thérèse from childhood. He had married her and baptized

her children, and felt a real affection for her and interest in her.

"I am not afraid, Monsieur le Curé," said Thérèse; "there is always the *bon Dieu* and His saints."

"Um—yes," said Monsieur le Curé; "but—"

"And," the widow broke in, "very soon my daughter Catherine will have finished her three years at St. Pol, and then she will be with me again, and will help me to take care of our poor Nicholas."

"I was thinking of that," returned the curé, "and it was one of the many reasons why I should urge you rather to send the boy away. He is not a fit charge or a fit companion for a young girl."

But again the widow's retort was, "Monsieur, God sent him to us, and He must therefore have thought us fit to have the care of him." And from this position no arguments could move her.

Very shortly afterwards, therefore, Thérèse and her unfortunate son left the village circle in which they were not welcome, and migrated to the desolate hut on the St. Pol road.

Here, in the course of another year, they were joined by Catherine, who, through the kindness of Monsieur Delorme, had been apprenticed to a glover in that town. She was now to work at home, only going backwards and forwards to the factory for materials.

She was now eighteen years of age, a pretty brunette, with clear hazel eyes and cheeks of russet bloom, recalling very much what her mother had been at her age, and presenting as strong a contrast as it was possible to imagine to her brother, upon whom every year seemed to produce a change for the worse.

The fear and aversion with which he was regarded by his kind seemed to have had the effect of rousing within his sluggish nature some measure of the animal ferocity with which he was credited. His fits of passion increased in violence, his dislike to the sight of strangers grew stronger still, and, though he made no actual assaults upon them, he would frequently greet passers-by with gibes and gestures the reverse of conciliatory. Even to his mother he was inclined at times to be violent, and was persistently refractory. The only person who had any real control over him was his sister. Her manner was particularly soothing and gentle, and her voice low; but at the same time she seemed to possess a certain firmness of character which was able to influence the idiot lad to an extraordinary extent. Curiously enough, a real bond of affection existed between this ill-assorted pair; and while the patience and tenderness of Catherine towards her afflicted brother were simply inexhaustible, he on his side responded to her kindness by a docility which he showed to no other human being.

At length so patent did this become that the widow, rendered irritable by sorrow and increasing ill-health, surrendered her son almost entirely to the care of Catherine, who, indeed, never left him except for the journey which she made once a week to St. Pol.

It was almost a twelvemonth after her return home that she was setting out one fine spring afternoon for a walk back to Boubet, after leaving her packet of gloves at St. Pol. She was walking very slowly, with her sweet eyes full of thought. Something which her employer's son had said to her that day had brought a new element into her life, and a new sense of happiness, and yet of unrest, into her soul. She was beloved, and by a man, to her notion, so infinitely her superior that, had a king stooped from his throne to woo her, Catherine would hardly have been more deeply impressed by the condescension. It was for the young girl the first awakening to the dignity and importance of her own personality; and, while her heart was still glowing and her cheeks burning with the rush of feeling which her lover's tender words had called up, she was almost inclined to laugh at herself. It seemed so delightfully absurd that she, Widow Alexandre's daughter, should be the object of any man's idolatry, and especially of such a *beau garçon* as was Jacques Mifaut.

While Catherine was thus indulging in half romantic, half comic, and wholly pleasant musing, the sound of rapid footsteps behind her deepened the flush on her cheeks, and slackened her pace. In another moment Jacques himself was by her side.

"So you thought to slip away without giving me the chance of accompanying you on your walk, did you, Mademoiselle Catherine?"

Catherine blushed still more, and laughed as in assent, but in truth she would have been disappointed as well as surprised had her lover let her so escape him.

"Monsieur Jacques," returned she, with admirable prudence, "I think before you walk with me it would be well to know what monsieur your father, and my mother, too, have to say on the matter."

"Do not be uneasy on that score, little one. My father is, happily, as much in love with you as I am myself, and has already given his consent; and as for your mother, good woman, we must try what we can do with her together, eh?"

Catherine knew that little opposition was to be expected to such a match on the part of her mother. So she only smiled and said, "How good, how generous on the part of monsieur your father!"

"Good! generous! I don't know," returned the young lover. "Anybody, I think, might be willing to have an angel for a daughter-in-law, and my father is not blind, look you! He can see just as well as I can that you are that, and more."

The argument was unanswerable.

The two walked on side by side for a couple of miles or more in the delightful state of exaltation and bewilderment consequent upon their new position, talking such talk as lovers love, and enjoying spaces of silence which seemed even more delicious and full of meaning, since Catherine's hand rested all the time softly upon Jacques' arm.

When the cottage was nearly reached, however, Catherine began to urge her lover to leave her. It was necessary, she thought, to prepare her mother for the news which she had to tell.

She had not, in truth, the courage to appear before her, hand in hand with a stranger; and, moreover, a sudden painful remembrance of her unhappy brother flashed like a spasm across her mind. Usually he was the almost constant object of her care and attention; but she recalled with a thrill of quick self-reproach that through this day she had not given him a thought; and now when he came into her mind it was with an uncontrollable feeling of dread and horror. What if he should suddenly spring out upon them in one of his fits of frenzy? What effect would it produce on the mind of Monsieur Jacques Mifaut to be thus introduced to his future brother-in-law?

At the bare notion poor Catherine's limbs began to tremble, and her cheeks to pale; and at length she made a resolute stand. "Monsieur," she said, "you must come no further to-day." And so, with many tender speeches and a kiss on her hand, which made the simple little country maiden feel like a queen, her lover left her, and she finished the rest of her journey alone.

Catherine was not quite so happy now as when she left St. Pol; and the nearer she came to her mother's cottage the less happy she grew, as the distance between her and Monsieur Jacques increased, and the vision of poor demented Nicholas grew clearer and clearer.

It was fortunate, indeed, that Monsieur Jacques had not ventured to accompany her home, for as the cottage was neared it became evident to Catherine that Nicholas was in one of his worst moods. Yells and shrieks of a most unearthly kind were mingled with high-pitched tones of expostulation from her mother; and before she reached the threshold of the cottage, Nicholas, in a state of almost complete nudity, rushed out, closely followed by the widow in hot pursuit.

"Catherine, Catherine," cried the poor mother, "you are here—Heaven be praised! I have been lost without you to-day. Nicholas has been terrible—the poor dear; and I am so worn out I can scarcely stand."

"You do, indeed, look tired, mother," says the girl, while with a caressing word and touch she manages to intercept the idiot's flight, and to draw him back with her into the cottage. But his state of excitement is so great that it is long before she is able to sooth or calm him.

"I cannot think what brought it on," says the widow, as she sinks back, pale and exhausted, upon the chair; "but the pain here,"—and she lays her hand on her side—"is terrible."

"You have been trying yourself too much, dear," says the girl, as she busies herself in all sorts of little loving attentions. By-and-by she persuades her mother to go to bed.

"The fact is," says the widow, looking tenderly at her daughter—"the fact is, I cannot do without you, my child, even for a day."

Catherine's cheeks flush with a certain consciousness. She feels somehow as though in listening to the proposals of her lover she had been guilty of treason against the mother who so depends upon her. And when she lies down at night in her own patchwork-covered bed she cries a little, not being quite sure whether it is for herself or her mother that she is sorry; and yet, in spite of her tears, there is an abiding sense of gladness in her heart as she thinks of Jacques' loving words; and when she sleeps, though her eyes are wet, her lips part in a smile, for she dreams that her hand is still held tenderly in his.

She awakes somewhere about the middle of the night, to see her mother standing by her side, candle in hand, with a face of deathly whiteness.

She jumps up. "What is it, mother?"

The widow leans against the bed, holding her side with one hand. "I have been suffering—that pain again," she says.

"You must take some cognac. I will get it for you."

"I have already taken some. I am better—now," says Thérèse. "But something forced me to come and look at you, to speak to you—once more," she added, in a lower tone.

"Mother mine, what do you mean? You are ill!" cries the girl, in a tone of alarm. "Let me run for the doctor."

"No—there is no need—the spasm may not return—only I—want to speak to you, Catherine."

Catherine was sitting up now on her little bed. Her mother sat beside her.

"I feel that I may not be very long for this world, and I want you to promise me one thing."

A sort of cold chill creeps over Catherine's heart. "What is it, *maman?*" she asks.

"It is about our poor Nicholas. I see that no one but you can manage him. I want you to promise—promise faithfully, that you will never abandon him, that you will always take care of him."

Catherine turns white and sick. She hesitates a moment before replying.

"I—I—"

The widow glances at her keenly. "Listen, Catherine," she says, solemnly, "whether I am here, or whether I am *there*—where spirits go, I believe that the *bon Dieu* will always let me know what is happening to my poor boy; and if you neglect him, or leave him, or give him up to strangers, my curse will be upon you."

"Mother, what makes you say such dreadful things?" cries Catherine. "Why should I neglect him or leave him? How can you think such thoughts? Why do you talk of dying? It frightens me."

"Poor child!" says the mother, putting her arms about the girl in a caressing way that was unusual with her. "I did not mean to speak harshly. But I have been lying awake, and in pain, and thinking—thinking of all that is likely to happen. Promise me, then."

"What, mother?"

"That Nicholas shall always be your first and dearest care."

"Dearest?" says Catherine, dreamily.

"Ah!" cries the widow, with a sudden clutch at her heart; "that pain again—that terrible, terrible—"

The sentence is never finished. In another

second she lies stretched, white and senseless, at her daughter's feet. Catherine raises her with difficulty and lays her upon her own little bed. She runs to fetch restoratives; she chafes the deadly-cold hands, but for a long time without result. All through the still hours of the night she watches, in trembling alternations of hope and fear, longing above all to summon aid, and yet not daring for a moment to leave her post.

At length the cold dawn creeps in by the uncurtained window, and in a little while the rigid lips relax, the closed eyes slowly open.

"My daughter!"

"My dear, dear mother! You are going to get better now, thank God!"

The sufferer smiles feebly, and lays her hand upon Catherine's. She looks into her eyes.

"You will promise?" she says, in a low, anxious tone.

Catherine waits a second before replying. The wistful eyes watch hers; there is a struggle to speak.

"Yes, I promise," she says. "You hear me, mother. I promise—"

The smile on the wan face deepens, and the hand laid upon Catherine's presses hers. The next moment, however, a spasm of pain passes over the sufferer's face, her eyes close, her hand relaxes its grasp, and the first sunbeam that lights the little chamber falls across the face of the dead!

When the news of Widow Alexandre's death spread through Boubet there was, of course, a good deal to be said as to the future of the widow's children. On one point, however, there was no room for doubt or discussion. Whatever might be Catherine's plans, it was certain that "le sauvage," as the unhappy Nicholas was generally called, must be sent to some asylum.

Before the funeral, which, according to law in France, took place within forty-eight hours after the death, Monsieur le Curé himself spoke to Catherine on this matter.

"Have you decided yet, my child, when you are going to send the poor fellow away? You had better make your arrangements at once, and I will do all I can to aid you."

"Monsieur, I have no arrangements to make," said Catherine. "So long as I stay here, Nicholas will be here too; and I fancy that Monsieur Delorme will not turn us out for our poor mother's sake."

"It is quite out of the question, my child, that you can remain the sole guardian and companion of that poor creature."

"Why impossible, monsieur? I alone can control him. He is—well, almost always good and reasonable with me. And besides, I promised my mother—"

"When?"

"Just before she died."

Monsieur le Curé dared not reply.

To Monsieur Jacques Mifaut, Catherine, the day after her mother's death, succeeded in writing a few lines. They were to this effect:

"I was very wrong yesterday to listen to you. I am wanted at home, and can never, *never* leave. So will you, good sir, please forget me, and forgive your poor Catherine for having even for a day deceived you?"

It was a pitiful little letter, written at a time of great trouble and excitement, and bearing strong internal evidence of the writer's agitation. It had its most natural effect. Jacques Mifaut simply refused to believe in it. He showed it to his father, and the next day the two men walked over to Boubet "to put matters on a clear footing." Jacques' father, at all events, was too conscious of the advantages of such a proposal to a penniless girl to be at all in doubt as to the result.

They arrived in Boubet at a critical moment—just as the little funeral train of the Widow Alexandre was turning into the churchyard; and when they asked for her it was natural to suppose that their object in presenting themselves was to join in paying her a last tribute of respect. They were at once directed to the open grave, and it was with a start, half of joy and half of terror, that the sobbing Catherine, at the conclusion of the sad ceremony, turned to find her lover beside her. He drew her arm through his with a word of tender sympathy, but when the churchyard was left behind them he had a word of tender reproach too.

"Why did you not let me know of your trouble? And again, why did you write me that letter?"

Then Catherine, called, as it were, to herself by the remembrance, gently withdrew her arm, and said, in a tone of alarm,

"Yes, monsieur is right to remind me. I had good reasons, excellent reasons. We must say adieu at once, and for ever."

"I will not hear of it, I will not allow it, there can be no reasons," says the lover, still walking by her side, "and see, my father is here too, to arrange everything."

Monsieur Mifaut, senior, comes forward.

"But if madame your mother is gone, who is there to arrange with?" he asks in some perplexity, pulling at a stumpy little tuft on his chin.

"No one but me, monsieur."

"Ah! *par exemple!*" cries Monsieur Jacques triumphantly, all difficulties vanishing in his outlook.

Then Catherine speaks of her brother; of the sacred charge committed to her, and of her promise. Jacques fidgets a little, and begins to wish his father had not been so ready to accompany him on the expedition. He has, to be sure, some knowledge of an invalid in the Alexandre family. Catherine, he remembers, has frequently spoken of her *poor brother*, but up to this point he has not troubled himself much as to details. Now it comes rather roughly upon him to be told, even in Catherine's tender voice, that the only living relative of his beloved one is an imbecile; and he is excessively alarmed for the effect which such a communication may have upon his father. So he is anxious, if possible, to persuade his father to return home without pursuing his investigations any further; but the elder Mifaut, being a man of purpose, is not to be turned from the object of his

expedition; and putting aside his son's suggestion, declares his intention of proceeding at once to Catherine's cottage in order to talk matters over.

In the end a melancholy little procession is formed as a sort of continuation of the funeral ceremony—Catherine and Jacques in front, two or three villagers following, and Mifaut the elder bringing up the rear with Monsieur le Curé.

This kindly man is much exercised in his mind with regard to Catherine and her luckless charge, and finding a willing listener in Monsieur Mifaut, he pours out his views to him. "Something must be done for the girl, and at once," he says; "she ought not to be left a day alone with that unfortunate creature."

"Is there madness in the family?" asks Mifaut *père*, somewhat anxiously. "Is the lad quite foolish?"

"Foolish is no word for it," returns the curé, shrugging his shoulders; "but as for insanity, no, no, there is nothing of that—the circumstances of his birth were enough to account for everything." And then he goes on to describe the murder of Amable, and the discovery of his body by poor Thérèse.

And all the time Catherine and Jacques pace on in front, the poor girl cheated into a momentary forgetfulness of her sorrow by the glowing presence of her young lover. After a while, however, and just as the cottage comes in sight, the discourse both of the lovers and of the two elderly men meets with a sudden interruption. A wild, gaunt figure, with tumbled hair and long claw-like arms, comes along the road with rapid strides, and with a peculiar cry. Instinctively Jacques grasps his stout stick as though to protect himself, and lays his hand on Catherine; but the girl, with a look of dismay, darts aside from him. "It is my poor Nicholas; he has then escaped. It was foolish of me to shut him in the house. He could not bear it, the poor dear—only I thought—to-day— Nicol! Nicol! come to me, my dear one," she cries, as he stands before them waving his lean arms and growling ominously. "Come, let us go home. I will not leave you again. Come, come—my dear!"

She winds her arm in that of the madman, and, with a touching sweetness which is evidently not without its effect upon his dark mind, persuades him to retrace his steps.

"This is awful!" says Jacques, scarcely daring to trust himself in the company of the savage creature whom the young girl caresses as though he were a pet child.

Monsieur le Curé points significantly to the strange pair. "It is another version of the old fable of 'The Beauty and the Beast,'" he says; "but I fear that no trasformation must be expected in this case."

"The beast—it, he I mean—is a horror," says Monsieur Mifaut *père;* "he ought to be shut up."

"Of course he ought. I've been saying so for years. It's not right that he should be going about; and as for that dear child Catherine, it's cruel, monsieur—that's what it is, upon her. It's abominable that she should be left alone with such a companion."

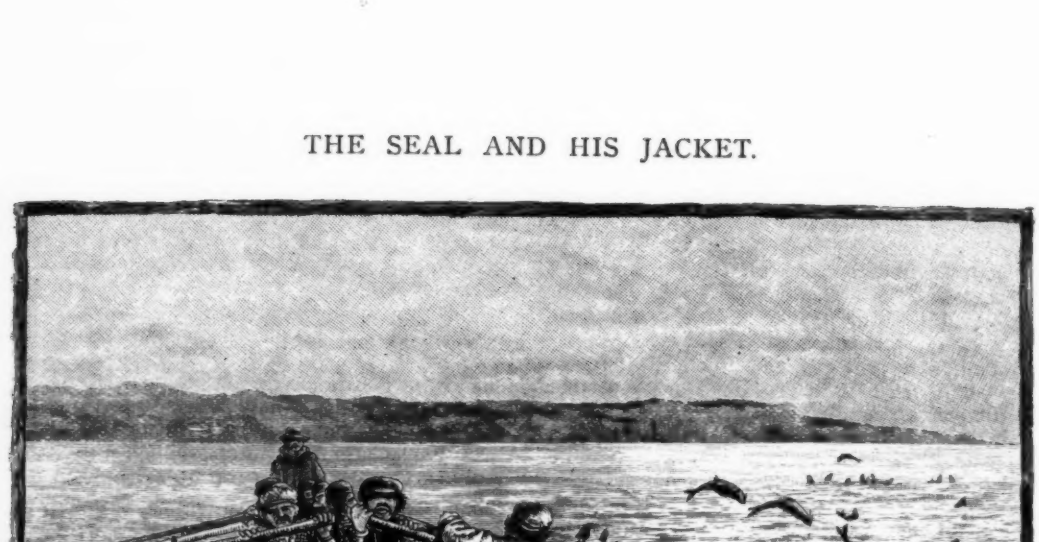
By dint of tenderest wiles Catherine had managed to lure her luckless charge into the shelter of their own garden. She turned to bid farewell to her friends, but found herself besieged, as it were, in her own fortress, and called upon to surrender. Jacques and the curé are eager and excited; Monsieur Mifaut *père* is more deliberate; the neighbours are anxious to see what will come of the affair.

The general demand is, of course, that the madman should be put at once under proper restraint.

Jacques pleads for himself, the curé for Catherine, the neighbours have much to say on their own account, and Monsieur Mifaut *père* utters many exclamations of horror, though in truth his real concern has little to do with the idiot's fate, but is simply to detach his son at once and for ever from such a frightful connection. He is, therefore, the least disappointed, though by no means the least astonished of the party, when the girl, pale and tearful, yet with a firm voice and something of the martyr-courage shining in her clear eyes, puts aside every suggestion made to her.

"You are very good—very good, Monsieur le Curé, Monsieur Jacques, all of you," she says, "but I promised mother that as long as Nicholas lives I will never leave him, or let him be taken from me."

Catherine kept her promise.



Twenty-one years later the name of Catherine Alexandre was sent up to the French Academy as a candidate for the Montyon prize. The petition was headed by a certain Monsieur Jacques Mifaut, manufacturer, of St. Pol, sous prêfet, employer of the candidate. Monsieur Mifaut, who was by this time a man of considerable importance in his district, the husband of an heiress, and the father of growing-up sons and daughters, stated that he had known and "respected" Catherine Alexandre from her youth, and could personally vouch for the truth of many of the details given, such as that she had refused more than one advantageous offer of marriage for the sake of devoting herself to her unfortunate brother. But of the terrible experiences of these twenty-one years passed beside a maniac no one could rightly speak, for they had been endured with all their dread monotony and ever-recurring terrors—alone.

A year after the Montyon grant, Nicholas Alexandre, the savage of Boubet, died, watched tenderly to the end by his good angel. She was by this time a woman prematurely grey and bowed, and though in reality little over forty, was known generally among her neighbours as "the old Catherine."

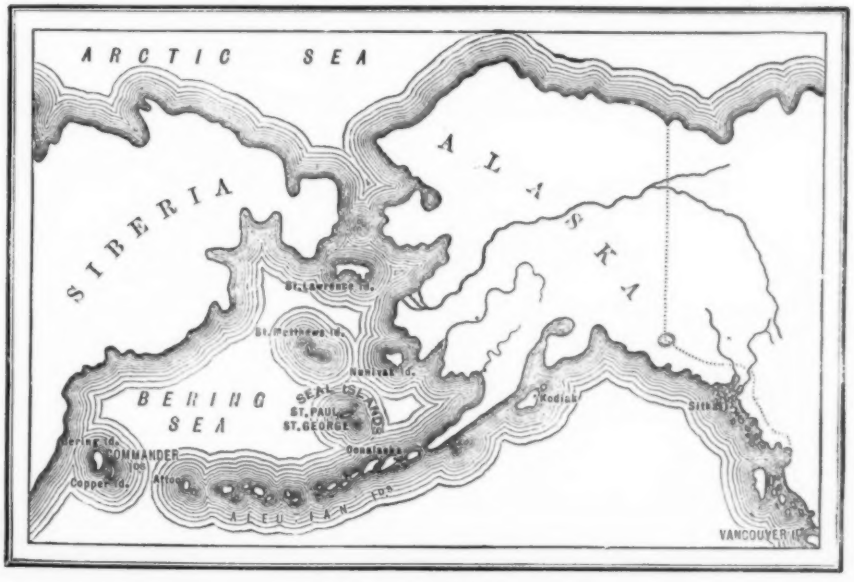
She lived on, however, many years, and added to her good works by taking upon herself, late in life, the care of a destitute family of orphan children, for whom she laboured up to the time of her death in the year 1866.

L. G. SÉGUIN.

# THE SEAL AND HIS JACKET.

SEALSKINS FOR THE SHIP.

THE Seal—that is the Fur one, not the Great one—is at large in the political sea. There is a quarrel on among his would-be captors. The Alaskan authorities and the Canadian authorities hold apparently irreconcileable views on certain points of interest in his life history; and "the British Government is moving in the matter." While it moves, in the good old leisurely way, we shall have plenty of time to say what we have to say on sealskins in general from the birth to the jacket. The reader will pray pardon this metaphorical overture; it is quite the proper thing in dealing with the seal. He is a victim to mixed metaphor at every period of his life. His father is a "bull," his mother is a "cow," he himself is a "pup," he is born in a "rookery," and killed in a "pod"—a truly strange Pilgrim's Progress: bovine, canine, corvine, and cruciferous!



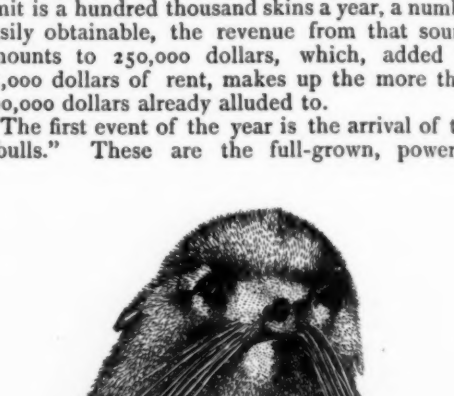
Just over a hundred years ago a rugged Russian, Gehrman Pribylov by name, and "stoorman" or ship's mate by trade, was much exercised in his mind by the revelations of an old Aleutian "shaman" at Oonalashka, who told him a legend of certain mysterious islands in Behring Sea. In the small sloop St. George he spent three successive years in searching for these islands, amid the most bewildering currents and winds and fogs known on the globe's oceans. In June, 1786, at the beginning of his third summer's tedious voyaging, he ran up against the cliffs of Tolstoi Mees, and through the fog, which was so thick he could scarcely see the length of his vessel, he heard the sweet music of a seal rookery wafted to him on the heavy air. He had found the object of his search, and he at once took possession of the island for Russia, and named it St. George, after the sloop that had borne him thither.

Leaving some men behind him to hold his new possession, he returned to Oonalashka. The men escaped and told the secret; and when next year he sailed for St. George a fleet of a dozen vessels followed him, and found the island; and the same year the island of St. Paul was found, thirty-six miles to the north-west of Pribylov's landing place. But on St. George there had been no sign of human habitation, while on St. Paul the Russians found, at a point now known as English Bay, the remains of a recent fire, and a pipe, and a brass knife-handle, whose owner has not yet been discovered, though the pipe and knife-handle are of considerable importance in the minds of some people as affording evidence of prior discovery, and therefore a right of possession for "the Anglo-Saxon"—whatever that may mean.

The Anglo-Saxon in one of his transatlantic avatars has now become the peaceable possessor of all the Pribylov Islands. The trade of Alaska gradually drifted into the hands of citizens of the United States, who held it under heavy mortgages. In 1867 the Russian Government sold Alaska and its islands to the American people, thereby imitating in a small way the policy of Napoleon Bonaparte, when he handed over to the Americans the French possessions west of the Mississippi, and so "gave them the possibilities of power that would eventually crush the arrogant English"—whom he had failed to crush in every other way. The bargain was not a bad one for the Washington Government, as a goodly part of the seven million dollars nominally paid to Russia really went to pay off the mortgages held by American citizens; and the Pribylov Islands alone, under the terms of their lease to the Alaska Commercial Company, have for years returned to Washington a yearly revenue of over three hundred thousand dollars, or over four per cent. on the nominal purchase-money of the whole 530,000 square miles of territory—for Alaska is not a small place: it is as large as France, Spain, and the British Islands all combined.

The Pribylov Islands are geographically but an insignificant portion of this vast area. They are in the heart of Behring Sea, 192 miles north of Oonalashka, 200 miles south of St. Matthews, and 200 miles west of Cape Newenham; and their total land surface does not exceed seventy square miles. They are therefore very valuable pieces of territory, and their whole value is given them by the seals. Their physical conditions fit them exactly for seal breeding-grounds. During the breeding season the fur-seal has to rest for two or three months on land, and requires a cool moist atmosphere, with firm, well-drained land, or dry broken rocks or shingle upon which to remain undisturbed by the weather and sea. And these conditions are found in perfection at the Pribylovs.

But though these islands have now the chief seal-fishery of the world, do not let it be supposed that they have the only fishery. A century ago fur-seals existed in millions on many coasts and islands of the South Sea. Juan Fernandez, Chili, the Falkland Islands, South Georgia, South Shetland, Prince Edward Island, the Crozets, Antipodes Island, and many more, mostly within our dominions, or within British influence, possessed rookeries, or breeding places of seals, which, if protected, might have been still as populous and valuable as those in Behring Sea. But every one of these, owing to the indiscriminate slaughter carried on by ignorant sealers, regardless of everything but immediate profit, has either been annihilated or so reduced in numbers that it hardly pays to visit it. A few thousand skins are brought annually to the Cape of Good Hope; a few thousand come from Patagonia and the Lobos Islands; but the only fisheries that flourish are those of British Columbia and the Commander Islands, belonging to Russia, and the Pribylovs, above mentioned, whose rookeries, it is admitted, are the centre of distribution of nearly all the North Pacific seals. "The only spot in the world," says Professor Flower, "where fur-seals are now found in their original or even increased numbers is the Pribylov group, a circumstance entirely owing to the rigid enforcement of the wise regulations of the Alaska Commercial Company, which are based on a thorough knowledge of the habits of the animals. But for this the fur-seal might before now have been added to the long list of animals exterminated by the hand of man." This is the fur-seal, be it understood, *Callorhinus ursinus*, not the seal, the hair-seal, *Phoca vitulina*, sought for his oil and leather, who haunts the ice floes off Labrador and Newfoundland, and tempts the sealers from Dundee. Of him and his numerous ill-treated



THE SEAL ISLANDS.

relations, and indeed of all the other *Pinnipedia*, we have here nothing to say, our business being entirely with the seal that yields the sealskin jacket.

Pribylov colonised his new possessions with inoffensive Aleuts from Atkha and Oonalashka. Where the Aleuts originally came from hardly concerns us here, but, according to Mr. Henry W. Elliott, from whose work, "The Seal Islands of Alaska," published by the American Government, much of our information is drawn, there can be little doubt that, like the junks frequently wrecked on the coast, they came from Japan or the Asiatic mainland. In Pribylov's first year Starry Ateel, or "Old Settlement," was founded on St. George. In the second year Big Lake Settlement was founded on St. Paul. The Aleuts then, as now, were inclined to be festive when opportunity offered, and the ruins of Big Lake Settlement are invariably saluted by the natives of to-day, who take off their hats to them as they pass by, and call the site Vesolia Mista, or "Jolly Place," while the old men whisper to the stranger that "in those good old days they had plenty of rum." From which unmistakable hint it is sufficiently apparent that the standard of Aleutian civilisation is not a high one. On both the islands there are not a thousand people, and these are almost entirely occupied in the seal-fishery, if fishery it can be called.

The first American to arrive on the islands after their transfer from Russia was Captain Ebenezer Morgan, a South Sea sealer, born in Connecticut. He began to prospect and survey, and put down stakes and "claim" seal-grounds, much as we hear is often done in the case of mines. A week or so afterwards there arrived Mr. H. M. Hutchinson, a native of New Hampshire, who had come on the same errand. Conciliation being the better part of trade, Morgan and Hutchinson went into partnership, and the first year had the seal islands to themselves. They then formed the Alaska Commercial Company, and, interesting and arousing the American Treasury and Congress, succeeded in obtaining a special resolution declaring the islands a Governmental reservation, and prohibiting any person taking seals thereon until further action by Congress. In 1869 the seals taken were only sufficient for the subsistence of the natives; but in 1870 a law was passed for the protection of the fur-bearing animals on the islands, and under its provisions the Alaska Company secured the lease which will expire this year. The company pays the natives forty cents, say, one shilling and eightpence, for the labour of taking each skin. The killers take the skins on the ground, each man cutting a notch in a stick, which at the close of the day he gives to a foreman or chief. At the close of the few weeks of killing the total sum for the entire catch is paid by the company to the chiefs, who divide it among the men according to the numbers notched. The money is paid in dollars. In the Russian days the Alaskan currency was a "paper" one, stamped on squares of walrus hide! Progress in Russia is slow, but even the walrus hide was an advance on the old Russian currency introduced into the empire in 1654, which consisted of bullion bars covered with notches or "rubli," so that the purchaser could pay for his goods in as many notches or "rubles" as he thought fit to chip off. For every skin the Alaska Company has to pay a Government royalty of two and a half dollars, and as the limit is a hundred thousand skins a year, a number easily obtainable, the revenue from that source amounts to 250,000 dollars, which, added to 55,000 dollars of rent, makes up the more than 300,000 dollars already alluded to.

The first event of the year is the arrival of the "bulls." These are the full-grown, powerful

THE FUR-SEAL.

seals that hurry on ahead of the shoal in order to take up a patch with a sea frontage, so as to intercept the cows as they arrive, and appropriate as many as they can for themselves, each for his own harem. The first bulls arrive in the first week in May. For days they spend the time swimming among the breakers a little distance from the shore, apparently reluctant to enter upon the terrible responsibilities of their peculiar matrimonial arrangements. By the end of May the sea is thick with bulls, and in the opening of June they begin to take up their claims. Their "land law" is a simple one. Each bull remains in possession of his ground, which is about eight feet square, providing that at the start and until the arrival of the cows he is strong enough to hold his own against all comers. The sea frontage is soon full, and then a battle royal begins which lasts night and day, with awful slaughter. The thin grey line is charged again and again by the thousands of bulls in the water. Some of the defenders are hurled back higher and higher up the beach; some of the new-comers slip through to the higher ground; some of the old bulls keep

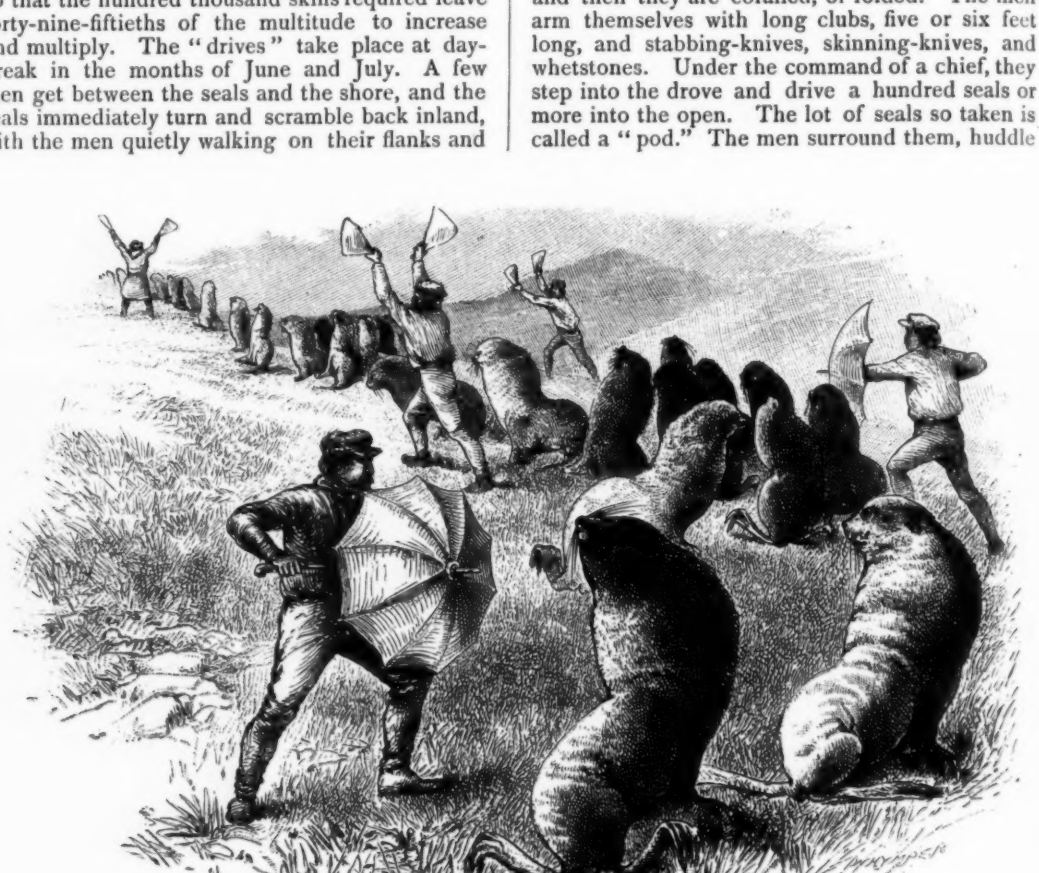
their strongholds to the last. It is only the fully grown seals that fight. They seize one another with their teeth, and tug and tug until the sharp canines tear out deep gutters in the skin or shred the flippers into ribbons. The warriors approach each other with comically averted heads, as though they were ashamed of themselves. When they get near enough to reach one another they enter upon the repetition of many feints or passes before either one or the other takes the initiative by gripping. The heads are darted out and back as quick as a flash; their hoarse roaring and shrill piping whistle never ceases, while their fat bodies writhe and swell with exertion and rage; and furious lights gleam in their eyes, their hair flies in the air, and their blood pours down in streams. In these battles the parties are always distinct; the one is offensive, the other defensive. If the latter proves the weaker, he withdraws from the position occupied, and is never followed by his conqueror, who complacently throws up one of his hind flippers, fans himself as it were to cool his fevered wrath and blood from the heat of the conflict, and sinks into comparative quiet, only uttering a peculiar chuckle of satisfaction or contempt, with a sharp eye open for the next covetous bull.

In a fortnight the battle is over. The bulls have all sorted themselves out, each on his little patch all over the rookery: the strongest on the sea front, the weakest in the rear, all waiting for the cows, that are now in sight. In hundreds and thousands they come, not so much to see their lords and masters, but to bring forth their young, which are born a few hours after they land. The experience of a seal cow is not a happy one. She is received with much attention by the bulls on the water line. Choosing the one that takes her fancy she is coaxed and urged up on to the rocks by him to an affectionate accompaniment of chuckling and whistling and roaring; but no sooner is she safely deposited on his particular claim than her admirer, seeing another cow in the water that he fancies would make a desirable addition to his family circle, devotes himself to similar blandishments, with a view of securing her. While he is thus employed the bull on the patch behind, finding him off his guard, picks up the passive cow by the scruff of her neck and hauls her on to his ground, whereupon bull number one turns and fights him, and bull number three further back gives the cow another grip and hauls her higher, whereupon one, two, and three all join in the battle and leave an opening for four, who seizes the cow; and so on for fifteen or twenty bulls, all helping cows up out of the waves, and raging and scrambling over them, until each has secured as his share from five to twenty.

About the 14th of July the beach is packed as close as it can hold. On each claim is the harem of small cow seals, and looking after them is their much larger master, holding them under jealous supervision.

For the first three months the young seal is of a jet black colour, with a little patch of white at the back of each fore arm. He is not treated with much kindness. If he stays on the claim, the old bull will fight for him; but if he strays beyond the limits, he may take as much hurt as he pleases, which may be somewhat owing to the fact that the bulls have only step-children to deal with! But what is more curious is that he does not know his own mother, though his mother knows him. The bull has to remain on duty all the time the seals are on the island, and consequently has to fast for three months in the year. But the cow as soon as the pup is born goes to and from the sea to feed, and how voraciously the seal feeds may be guessed from the fact that ten pounds of fish per day is a moderate allowance. When the mother comes up from the sea, in which she has been to wash or perhaps to feed for a day or two, she feels her way along to about where she left her pup last. Perhaps she misses it, and finds instead a swarm of pups, in which it has been incorporated, "owing to its great fondness for society." Without first entering into the crowd of thousands she calls out just as a sheep does for her lamb, and out of all the din she, if not at first, at the end of a few trials, recognises the voice of her offspring, and then advances, striking out right and left towards the position from which it replies. But should the pup be asleep and making no sound, the mother contentedly curls herself up and takes a nap, or lazily basks until she tries again.

When a month old the pup begins to learn to swim. For a week or so he flounders about on the margin of the surf, using his forepaws as if he were a dog, and letting his hinder ones hang limp. Every minute he is washed ashore high and dry, to return and be washed ashore again. After a time he learns to use his hind limbs, and then his progress is rapid. By the middle of September the year's pups are all accomplished swimmers, and soon the migration begins, so that by the beginning of November the rookery is well thinned, and at the end it is deserted.



Next year the yearlings arrive with the cow seals, and pass through and between the harems by paths recognised as neutral by the pugnacious bulls. They go right through the rookery, and take up their stations in "pods" or flocks at the back of the bulls' claims. This passage of the youngsters along the path is remarkable. If they mind their own business and go straight up and down, they are unmolested, but the instant they begin to nose about right or left, they are pounced upon by the jealous bulls, and torn limb from limb.

On their second return the females are stopped on the claims, while the males and young are permitted to use the path; but as a rule the males go off to a "hauling ground" close by. This hauling ground is the home of the "holluschickie," or bachelors, who, on their migration to the north, have escaped the Canadian sealers and the United States sealers other than those employed by the company. From the hauling-ground the seals are driven to their doom. The cow is spared, as she is wanted for breeding purposes; the bull is spared because his fur is coarse and worthless; it is the gay young bachelor, some four feet high and a yard in chest measurement, and who has not yet arrived at an age to be

trusted with a family, who has to yield up his jacket for human comfort and decoration.

The fur of the seal is thickest and finest in texture during the third and fourth year of life, and the selection is made from the males of that age. There are five million seals at a time on the rookeries and hauling grounds of the Pribylovs, so that the hundred thousand skins required leave forty-nine-fiftieths of the multitude to increase and multiply. The "drives" take place at day-break in the months of June and July. A few men get between the seals and the shore, and the seals immediately turn and scramble back inland, with the men quietly walking on their flanks and once more, clatter a few bones with a shout along the line, and the seal shamble begins again. Their march to death and the markets of the world is taken up anew."

They are driven for a mile or more—some of them are driven five miles—up to the village, where there is a salthouse for preparing the skins, and then they are coralled, or folded. The men arm themselves with long clubs, five or six feet long, and stabbing-knives, skinning-knives, and whetstones. Under the command of a chief, they step into the drove and drive a hundred seals or more into the open. The lot of seals so taken is called a "pod." The men surround them, huddle

DRIVING THE FUR-SEAL.

in their rear at the rate of two miles an hour. "The holluschickie," says Mr. Elliott, "are urged along over the path leading to the killing grounds with very little trouble, and require only three or four men to guide and secure as many thousand at a time. They are permitted frequently to cool off, as heating them injures their fur. These seal-halts on the road always impressed me with a species of sentimentalism and regard for the creatures themselves. The men dropping back for a few moments, the awkward shambling and scuffling of the march at once ceases, and the seals stop in their tracks to fan themselves with their hind flippers, while their heaving flanks give rise to subdued panting sounds. As soon as they apparently cease to gasp for want of breath, and are cooled off comparatively, the natives step up them on to each other, and stun such as the chief points out by a heavy blow on the head. The clubs are then dropped, the men seize the prostrate seals by their hind flippers, and spread them out on the ground without touching each other. Then every sealer takes his knife and drives it, before the seal returns to consciousness, into the heart at a point between the fore flippers, the seals having to be bled in order that the strange reaction which the sealers call heating shall be delayed for half an hour or so. Were the fur-seal to be skinned alive his jacket would be worthless. The unclubbed seals are allowed to escape down the hill into the sea.

In skinning, the body is balanced squarely on its back; a swift cut is made from the lower jaw to the root of the tail; the flippers are then cut

round; and then, with the smaller knife, the skin is worked off. The best man can skin a seal in a minute and a half, but the average time is four minutes. Nothing is left of the skin on the carcase but a small patch on which the coarse moustache grows, the skin on the lip of the lower jaw, the insignificant tail, and the bare hide of the flippers. The skins are taken to the salthouse and laid out, hair to fat, one on the other, in piles, and treated with salt for two or three weeks. They are then sufficiently pickled to be packed up in bundles of two for exportation. In such bundles they are stowed in the company's steamer and taken to San Francisco, whence they come direct to London, for, strange to say, the sealskins of the world come to London to be dressed.

As received the skin is not in the least like what it will be. The fur that is prized so much is to the seal what the down is to the bird, and it is hidden entirely by a coat of stiff over-hair: dull, gray, and grizzled. The salt is first washed off; the fat is then removed, the skins are then washed, and the grease and water removed by the knife; and then they are tacked on frames to keep them smooth, and are dried in a moderate heat. They are then soaked in water and thoroughly cleansed with soap, and then, after another drying, the warm skin is placed over a beam, and the hair removed with a knife. When all the hair is out, the skins are dried, then damped, and then shaved. They are then stretched, worked, and dried, and softened in a fulling mill, or trodden with bare feet in a barrel, the workman dancing upon them to break them into leather, while the grease is absorbed with hard wood sawdust that from time to time he dusts in. The skins are then dyed, the dye being put on with a brush. They are then dried and dyed again, and dried again and dyed again, until they are of the desired colour, sometimes eight or even twelve coats of dye being required. They are then shaved down to the proper thickness, softened again in a hogshead, and sometimes run in a revolving cylinder, with fine sawdust to clean them. With all these many processes and freightages, no wonder that the finished fur costs as many pounds as it brought pence to the killers on the Pribylovs.

That the Alaska Company does well is clear enough; but that it will ever obtain or retain a monopoly of the seal trade is very doubtful. Every year its close time rules increase the number of seals in the sea; but that it can claim every seal in the North Pacific is preposterous. There are other rookeries now, and at any time we may hear of further rookeries being established under another flag by some enterprising cows and a few of the gay young "holluschickies" who have had the good luck to keep beyond the reach of their tyrannical fathers and the clubbing Aleuts.

## RECOLLECTIONS OF AFRICAN EXPLORERS.

WHEN I told a German friend in New York that Stanley was said to have had 122 tropical fevers, the honest Teuton exclaimed, wonderingly, "Did he haf dem *all at once?*" The remark showed what men were prepared to believe of the hero of Lake Tanganyika and the Congo; and, after all, such a man would probably suffer less in being killed by fevers or poisoned arrows abroad than by fashionable dinner-parties at home.

When I first saw Stanley, fresh from his finding of Livingstone, he looked, in spite of all his sufferings, like one who had thoroughly enjoyed his work, and had felt himself to be just in the right place. Gaunt, sun-burned, scarred, wasted, with ominous streaks of grey in his dark hair, and the traces of a long and bitter struggle in every line of his sunken features, he still wore the brisk, ready, confident look of the man who could "go anywhere, and do anything." When I last saw him, shortly before he went forth to rescue Emin Pasha, nothing was left of the Stanley whom I had known save the deep, earnest eyes, and the stern, daring, dauntless spirit which looked through them. The slight, compact, wiry frame was growing loose and fleshy, the firm face had lost its bold clear outline, and over the whole man brooded the weary, nerveless air of one who felt himself wholly out of his element, and who, in this uncongenial atmosphere of luxury and civilisation, was far too comfortable to be happy.

"You're lucky to have had a fever to train you down so fine, and the best thing I could do just now would be to catch one too," said he, alluding to the sequel of our West African adventures after our shipwreck with King Oko Jumbo on our way to the Congo, and doubtless little dreaming how soon his jesting words were to be fulfilled in terrible earnest. "Town life isn't good for explorers, and sitting on the deck of a yacht in an easy-chair, with no exercise, and five or six meals a day, isn't good for them, either. I don't myself see why on earth a man shouldn't be just as well in Africa as in London if he goes the right way to work, barring one of those unavoidable fevers now and then; but these young English fellows who come out to me on the Congo never *will* remember that Africa is not Europe. They see a hill in the distance, and call out at once 'Hollo! here's a real African mountain: let's go to the top of it!' And up they go in the full heat of the sun, and then can't understand why they're fit for nothing when they come down again. It's just the same, too, when they have to do that march through the grass country of the Lower Congo to avoid the rapids. 'What's the good of coats and wraps in Africa?' they say; 'as if it wasn't hot enough without 'em!' And

away they go, ploughing through grass eight or ten feet high till they're all in a steam of perspiration——"

"As well they may be, according to my experiences among the fifteen-foot corn of North Africa," annotated I.

"And then," continued Stanley, "they come up all at once on to the crest of a ridge, and the wind strikes full upon them, and they have no wraps to protect them, and of course they get a chill, and down they go with the fever; and even if they don't die, they're of no use for two or three months on end. And then, of course, every one sets up a halloo of 'More victims to the deadly climate of Africa!' as if any climate wasn't deadly if a man chooses to play the fool!"

"Have you settled yet," I asked, "whether the Aruwimi river (the lower part of which you explored a little while ago) is the same as that mysterious 'Welle-Makua' which Dr. Schweinfurth found flowing through Niam-Niam Land in 1870? I'm rather interested in that question at present."

"Well, I can't pronounce positively on that point," said Stanley, "until I know more about it; but it doesn't very much matter after all. We know that the Aruwimi goes into the Congo, which is the important point just now. As for where it comes from, we'll know all about that, too, before long."

When I looked back upon them later on those words seemed almost prophetic, for at that time he could certainly have had no idea of the wonderful march that he was about to accomplish, with that very river for a starting-point, on his way to meet Emin Pasha. But what chiefly impressed me at the moment was the quiet confidence which could speak of one of the most difficult and formidable tasks in the whole field of African exploration as a thing to be achieved whenever he had time to attend to it.

"I wish you would tell me something of those white Africans of yours," I resumed, "for those whom Mrs. Ker and I met with in West Africa seemed to be isolated phenomena rather than members of a distinct race like yours in the East. They had woolly hair, but it was *red;* and the complexion of all alike—whether men, women, or children—was a sort of yellowish-brown."

"Well," said Stanley, "that's pretty much what *my* white Africans were like. Those that I saw were tall, sinewy, long-limbed fellows, with crisp, reddish-brown, curly hair, and a complexion not a bit darker than many a mulatto whom I've seen in the Southern States of America. I only met four of them myself, who were with M'tesa's army in Uganda when we fought the Wanyoro; but I was told of a whole tribe of them that lived on the higher slopes of Mount Gordon Bennett, to the east of the Victoria Nyanza. They lived chiefly on milk, and were not—so far as I could find out—one bit higher in point of civilisation than the ordinary negroes around them."

And then he went on to talk of his famous voyage down the Congo, and of the last terrible days when it seemed as if they were all doomed to perish almost within sight of their goal. "It *did* seem hard," he said, "to lose so many fine fellows when the worst was over, and we were really beginning to see our way to the end at last. You know how I lost poor Frank Pocock—drowned in shooting a rapid almost at the end of our journey, after escaping unhurt from all our battles and perils in the interior. Then my brave Safeni, too—one of the best and bravest native captains that I ever had—went mad from the strain of that long misery, and wandered away into the forest all by himself, and never came back. I can't tell you half the things I've done to find out what became of him. I've arrested dozens of chiefs, and offered rewards of cloth enough to make any native rich for life; but I've never had any word of him from that day to this. I'm afraid he must just have been snapped up by one of those gangs of kidnapping slave-hunters, who would think it an advantage rather than a drawback that the poor fellow was out of his mind, because it would make him all the easier to handle. But the worst thing of all was to see poor little Amina, the wife of one of my Arabs, break down and die just as things seemed to be at the blackest with us all, saying to me with her last breath, 'This is a bad world, master, and you have lost your way in it.'"

"And this is the man," thought I, as I listened in secret wonder to the iron man's tone of deep emotion, "who has been called a wanton blood-shedder and a waster of his people's lives! *This* does not sound very much like it, anyhow."

However, it is only natural that any man who has not actually been in Africa himself should form a mistaken estimate of African explorers, it being absolutely impossible for him to realise the full horror of all that is implied by the words "African exploration." To most untravelled readers, the idea of a march through tropical swamps and jungles presents itself merely as a long and rather hot walk, with a few occasional excitements in the way of snakes or wild beasts, and perhaps a slight difficulty now and then in procuring supplies. What it really means is to lead a life that is one long death—to suffer for days together the slow tortures of grinding famine and the burning agony of a thirst which a river could not quench—to wear out long nights of sleepless pain and fever, or drop down to sleep from sheer exhaustion, and awake sick and unrefreshed—to feel that every living thing is your enemy, and that man himself is the deadliest of all—to suck in poison with the water that you drink and the very air that you breathe—to drag your weary, aching limbs through the knee-deep mire of festering swamps, or along the muddy, trampled "elephant-paths" of gloomy forests, whose dripping foliage shuts out the very sky, and whose hot, rank, vapour-bath atmosphere makes you sick and faint—to stagger onward with reeling brain and failing strength, knowing all the while that to give way, or even to pause for a moment's rest, may cost you your life—to be checked, and perhaps forced to retrace your steps over ground that you have passed at the price of sufferings more bitter than death—and, worse than all, to see your brave comrades wasting and

perishing all around you, without being able to afford them the slightest aid.

The mention of Stanley's name naturally suggests that of one of his ablest lieutenants, Major Francis Vetch, who figured in the Zulu War, and afterwards acted as head of the local transport service on the Lower Congo, under Stanley's administration. It was during this term of service that he made his expeditions to Damaraland (a region lying to the south of the Portuguese settlements beyond the mouth of the Congo), the record of which, had he lived to write it, would have made one of the most entertaining books in existence. He was not less skilful as a sportsman than as a soldier or an organiser, and, after his exploit of shooting five elephants in one day, the grateful natives (who had already christened Stanley himself "Bula Matari"—the Rock-Breaker—in memory of his blasting away the rocks at Isangila to make a passage for his new road up the river) bestowed upon Major Vetch the honourable title of "Mavunda Nzou" (Elephant's Death), by which he was known ever after throughout that whole region.

But all distinctions and titles of honour seemed superfluous to this quiet, unassuming, straightforward hero, who was emphatically one of those that

> Went about their greatest deeds
> Like noble boys at play.

I have seen him in a dismal, leaky, tumble-down hut amid the deadly mangrove-swamps of the fatal "Ivory Coast," the life and soul of our forlorn party, brave, helpful, and cheery as ever, without a shadow of pain or despondency on his firm, manly face, although he himself was suffering more grievously than all. And when help came at last, and the way back to England lay open before us, this man, worn-out though he was, and deprived of the barest necessaries by the loss of his outfit, persisted in going onward to his appointed post, though only to be sent home invalided a few months later. I have seen him aboard a sinking ship, working coolly and bravely to the very last to save all that he could, with the deck splitting asunder beneath his feet. I have seen him wade back into the flooded cabin in utter darkness, with the doomed vessel already reeling to her final plunge, to grope out the precious quinine which afterwards saved more than one life among our castaway crew. Many a Victoria Cross has been given for a less daring deed; and better would it have been for him had he died in that heroic venture, or on one of his Zulu battlefields, instead of surviving only to perish miserably, barely two years later, by the fever of that terrible coast, which is only too truly described by the old nautical couplet:

> Beware, beware of the Bight of Benin!
> For one that comes out, there were forty went in.

Vetch was as little given to talk of his own deeds as Livingstone himself; but the little that I could persuade him to tell me while we were together in Africa about his travels through Damaraland was well worth remembering. "You should go there yourself," said he, "if you want fine scenery and a healthy climate. There's not such another bit of country in all South Africa, except perhaps Zululand itself. You should just see what oxen I've been bringing up from there for our Congo transport—out-and-out the finest beasts that we've got. It's not so easy to get down there now as it used to be, for the British African steamers have left off touching at Mossâmedés (which is the nearest Portuguese port), and the Portuguese coasters are not very reliable; but when you *do* get there, you'll see something good, I can tell you. To imagine the general outline of the country you have only to fancy an enormously tall house with a door-step fifty miles broad, the step being the low seaboard, and the house the range of rocky heights (you might almost call them mountains) that start up suddenly hundreds and even thousands of feet above the plain. Ages ago the whole of that low level was at the bottom of the sea, and the waves of the South Atlantic were beating against these heights, which then formed the sea-cliff marking the boundary of the coast; but now the water has receded, and left the plain dry as well. You can have any climate you like while you're there; for on the top of those heights there's a vast table-land—just like that country up in the air that you read of in 'Jack and the Beanstalk'—where you find European flowers and fruits, and the keen bracing air of Europe; and then, if you want tropical vegetation and tropical heat by way of a change, you have only to go down to the plain and get them at once."

Another striking figure in my gallery of African travellers is that of Winwood Reade (author of "Savage Africa," "Liberty Hall," etc.,) who, though partially eclipsed by his renowned namesake and relative in the field of literature, has stamped his name indelibly on that of geographical research as the daring and successful explorer, if not indeed the actual discoverer, of that remote and mysterious spot where, far away in the grim solitudes of the Kong Mountains, trickles from between two dark rocks that tiny stream which is hereafter to become the mighty Niger. The quaint epithet of "gauntly handsome," applied by a popular novelist to one of his heroes, photographs Reade as he was when I first met him. His tall, slender figure, and dark, handsome, rather dreamy face, were much more suggestive of an artist or a poet than of a hardy and adventurous explorer. Nor did his conversation do more than his outward aspect in helping a stranger to guess what he really was; for, from first to last, I never heard him make the slightest allusion to those perilous achievements of which many men would have boasted without scruple.

When I saw him for the last time he was just setting off on his mission as a special correspondent to the seat of the Ashantee War of 1873-4, which drew to it two other men even more famous than himself—viz., Stanley and Major Butler, of "Great Lone Land" celebrity. The tinge of melancholy which had by that time

become habitual to him matched very picturesquely with the Byronic outline of his features; but a superstitious observer might well have seen in it the deepening shadow of approaching death. And such indeed it proved to be; for, although he survived all the perils of the dreadful march to Coomassie, and came unharmed through the rain of fire that fell upon the gallant "Black Watch" in the fatal wood of Amoaful, a less glorious end was awaiting him at home only a few short months later.

Of the three great pioneers—Schweinfurth, Rohlfs, and Nachtigall—whom Germany has sent into the field of African travel during the present generation, the last in some respects stands highest of all. Few more daring deeds have ever been done than the adventurous doctor's journey across the whole breadth of the Sahara Desert, from the Mediterranean to Lake Tchad. In fact, it repeated with singular exactness the wonderful exploit of Réné Caillié in 1829, substituting the coast of Tripoli for that of Barbary as its starting-point, and the great inland sea of the Soudan for Timbuctoo as its final goal. Nor were the perils of the gallant Frenchman among the fierce Moorish tribes of the western Sahara one whit more formidable than those encountered by Dr. Nachtigall further to the eastward, in traversing the savage region where poor Miss Tinné—herself no mean name in the annals of African travel—was cruelly murdered by the ferocious Tuaregs of Ghat not many years ago.

It has, indeed, been said by some members of that numerous body which persistently strives to belittle every feat that it cannot, or dare not, perform itself, that but for the protection and friendship of a Mohammedan devotee whom he met on his way his great task would never have been accomplished; but it was his own skill and good judgment which won him that protection, and he deserves the full credit of all the advantages reaped from it. Moreover, even the expedition to Lake Tchad, which would have sufficed most men for a lifetime, was not enough for *him*. He pushed on through the still more dangerous and unknown regions to the south of it, and his exploration of the Logoné River (one of the great lake's southern feeders) and its tributary, the Bahar-Kuti, will bear comparison with the boldest achievements of Clapperton, Denham, and Mungo Park. Justly, indeed, did his countrymen choose for the site of his monument the noble headland of Cape Palmas, looking down from one side upon the infinite sea, and from the other upon that mighty and unknown continent whose secrets he gave his life to penetrate.

But his just fame rises higher still when we consider that, despite his phenomenal hardihood and endurance, he was not naturally strong like his two famous rivals. He would often describe with considerable humour the amazement of the bulky savages of Kanem and Bornu at the smaller stature and comparatively slight build of this man who had come so fearlessly among them—an amazement as naïvely expressed as that of Murad Bey, the Mameluke chief, who, when he first saw Napoleon, and found that the terrible "Fire-King," that had mown down his warriors like grass, was a thin, awkward little man, barely five feet high, smote his hands together and exclaimed fiercely, "O Allah! what have thy servants done that they should be conquered by a *thing* like that?"

The last African traveller whom we saw in Africa itself was Mr. H. Johnstone (author of "The River Congo," &c.), who, when we first met him, was acting as British Consul at Duke Town, the native capital of the West African district of Old Calabar, presided over by a fat old coloured gentleman named King Duke (with a flaming scarlet umbrella for his insignia of royalty), who, like the Kentucky carrier in the story, was "frequently honest, and occasionally sober." When I climbed the steep ridge from which the consular residence overlooked the town I was somewhat startled to find there, instead of the bronzed, battered, bearded traveller whom I expected to see, a slim, smooth-faced, almost boyish figure, in straw hat and white flannels, very much like the captain of a cricket eleven at Eton or Rugby.

On our return from visiting the Portuguese settlements in Angola, and the line of their projected railway up the Coanza River, to "cut out" the Congo State, we found Mr. Johnstone leading a kind of Robinson Crusoe life on a small rocky islet in the centre of Ambas Bay (near the mouth of the Camaroons), in a tiny house which, perched on the summit of a precipice whence one narrow path zig-zagged through matted thickets down to the water's edge, would have charmed a seventeenth-century buccaneer. He had already made one expedition up the Camaroons—the higher course of which was still unknown—and was then planning a second that should penetrate the mysterious region beyond those mighty mountains which loomed like gathering storm-clouds along the northern sky, and which first became celebrated a quarter of a century ago through the climbing exploits of Captain Burton. But when he detailed his projects, I could only wish him safe out of them, having seen by fatal proof only a few months before what the Guinea Coast could do.

On our homeward voyage from the scene of our shipwreck at Cestos River one of our fellow-passengers was a shrivelled, bloodless, ghastly spectre—so wasted that one of the cabin-boys carried him on board as easily as a doll—whose white, sunken, haggard face might well have been mistaken for that of a corpse but for the unnatural brightness of the large, hollow, wistful eyes. This miserable wreck was all that remained of a brave young German doctor, the first, though unhappily not the last, victim of that ill-fated German expedition which was sent out to explore the upper stream of the Benueh or Chadda (the great eastern tributary of the Niger) in 1884-5. When he began to recover (for he *did* eventually live, or I should rather say he did not die) he told us many strange experiences, most of which were far too horrible to be quoted here.

DAVID KER.

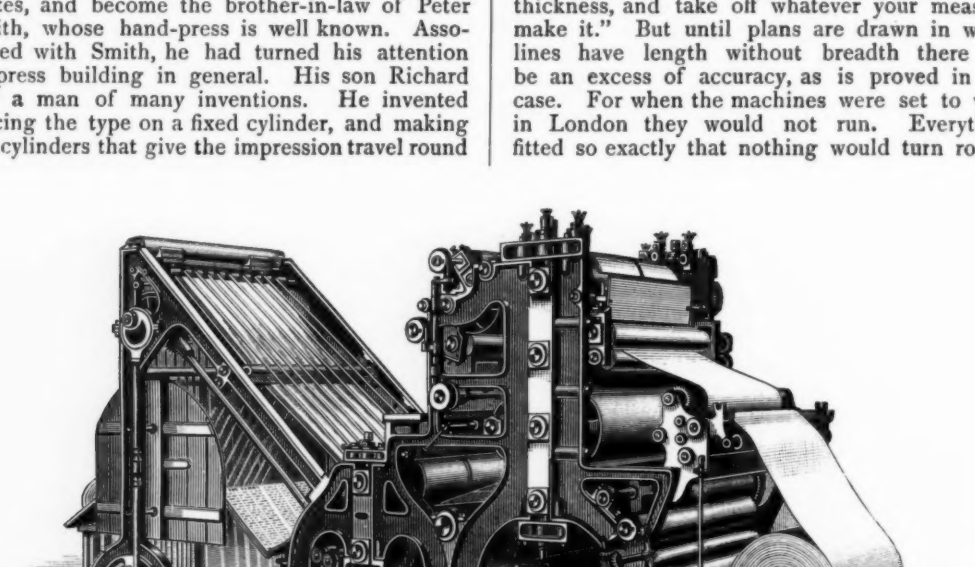
# THE NEWSPAPER PRINTING PRESS OF TO-DAY.

ANYONE who has spent a night in a newspaper office will have realised how vital speed is to journalism. In the small hours of the morning, when the last speech is coming in on relays of flimsy telegrams, and the compositors are working short "takes" of half a dozen lines apiece, perhaps every one of this one speech; all on the rush, so that the fingers peck at the cases as if the types were alive and fighting in the boxes, and "the man in the opening"—that is, the one behindhand with his instalment—is having a life led him to hurry up; then, indeed, is apparent the need of speed, for the newspaper train waits for no man, and no matter how late the speech may end, the race against time must always be won.

Few people outside the ring have a notion of how a daily newspaper is made, or how the three hundred men on its staff find employment. Of the seventy compositors—"Seventy!" the reader interrupts. "What can they find to do?"

Let us take an ordinary copy of the "Times," and disregarding all previous estimates, which are mostly exaggerated, count it up for ourselves. Here is to-day's paper, an ordinary one, and a very unfavourable one for our purposes, owing to the space occupied by a celebrated case. It consists of two sheets each of eight pages, each page of six columns. Of the ninety-six columns sixty-one are news, and the remainder mostly solidly printed advertisements, 1,264 in number. The columns one upon the other would measure fifty-eight yards over all. If the matter had been printed in book form, in the same type, it would have made a volume of 384 pages. It contains 200,000 words, and the million letters with which they have been set would extend side by side for close upon a mile. Even an ordinary penny daily will have its 750,000 letters, to say nothing of the leads and spaces; and at least half of these have to be manipulated between six o'clock in the afternoon and one o'clock in the morning.

The "Times" is an unfortunate illustration perhaps, as for years the greater portion of it has been set by machinery, the ordinary notion of printing—a man sitting at a piano and rippling out types—having been long realised in that office regardless of expense. Nearly all the paper except the advertisements is now set by Kastenbein machines, as improved by the late Mr. Macdonald; and in fact not a little of the paper's unpopularity among "the trade" is due to its being a non-society office, and "employing machinery to do the work of men." The "Times" has a telephone connected with the Houses of Parliament. The shorthand notes are read off at Westminster through it, and the messages are dictated to the type-setters. Later in the night the original transcript of the shorthand writer is received, and the proofs are read by it, so as to check the telephonic dictation. The machine works at great speed, and sets a column of solid matter in an hour. All its disadvantages are made the most of by outsiders, and it is no secret that the Partingtonian broom has been at work for years endeavouring to keep out the machine-type-setting sea.



Besides the Kastenbein there are at least half a dozen successful patterns of these mechanical compositors without souls. There are the Mackie, the Swedish Lagerman, and the American Mergenthaler, now better known as the Linotype. There is the Fraser, which set 10,000 pages of the "Encyclopædia Britannica," and for book-work is in such growing demand. There is the Hattersley, which is at work on the Liverpool papers and at Sheffield. And there is that ingenious nicked-type machine the Thorne, now used on the "Manchester Guardian," a single apparatus which both distributes and composes, the types going in at one end and coming out set up at the other, requiring only to be "justified."

But the bulk of our journals are set by hand; and busily go the hands at half-past one in the morning. About two o'clock the last page reaches "the foundry" to be stereotyped. Stereotyping is an old device. Van der Mey used to solder the bottoms of common type together, and make a stereo in that fashion. Ged, the Scotchman, began the new style; Andrew Wilson introduced the plaster of paris method; Cowper had, of course, something to say in the matter; but stereotyping was useless for rotary purposes until Dellagana's papier-maché process appeared. In fact, there has been no part of the present system of printing which has not been of gradual development.

"On asking," says Mr. Herbert Spencer of the Walter machine, "not what is its proximate, but what is its remote origin, the reader finds in the first place that this automatic printing machine is lineally descended from other automatic printing machines which have undergone successive development, each presupposing others that went before; without cylinder printing machines long previously used and improved, there would have been no Walter press. He inquires a step further, and discovers that this last improvement became possible only by the help of papier-maché stereotype, which, first employed for making flat plates, afforded the possibility of making cylindrical plates. And tracing this back, he finds that plaster of paris stereotyping came before it, and that there was another process before that. Again, he learns that this highest form of automatic printing, like the many less developed forms preceding it, depended for its practicability on the introduction of rollers for distributing ink instead of the hand implements used by printers' devils fifty years ago; which rollers, again, could never have been made fit for their present purposes without the discovery of that curious elastic compound out of which they are cast. And then, on tracing the more remote antecedents, he finds an ancestry of hand-printing presses, which through generations had been successively improved."

In "The Centenary of the Rotary Printing Press" we dealt with comparatively ancient history; in this paper let us carry our tale up to the latest development.[1]

Applegath's vertical cylinder had a creditable life, but a short one. In 1848 a Paris newspaper, "La Patrie," received a "Lightning Press" from America. This was the invention of Richard Hoe. Hoe's father was a Leicestershire carpenter who had emigrated to the States, and become the brother-in-law of Peter Smith, whose hand-press is well known. Associated with Smith, he had turned his attention to press building in general. His son Richard was a man of many inventions. He invented placing the type on a fixed cylinder, and making the cylinders that give the impression travel round

THE WALTER PRESS.

it; then he put the type on a revolving cylinder, and kept the impression cylinders in fixed positions. This was the Lightning press. The Planetarium, as Hoe's first rotary press was called, was patented—his third patent—on 30th July, 1844.

In 1851 a second Lightning machine crossed the Atlantic, this time to London, to print "Lloyd's News." Its superiority for newspaper work was at once acknowledged. Two similar machines were ordered for "The Times," on condition that the workmanship of the new Lightnings was not so flashy; and to ensure the best of workmanship it was arranged that they should be made at Whitworth's of Manchester, then reputed to be the most accurate mechanics in the world. A somewhat amusing story is told of Whitworthian exactness. When the first machine was being erected Hoe's representative found that one of the spindles was a little too tight, and he sent it back to the shop with a request for "a shade" to be taken off it. Up came Whitworth's highly scientific foreman to tell the American that in their shop they did not work to "shades," but to measurement. "If you will tell us what you want in decimals, we will do it, but we will have none of your harum-scarum shades!" "Oh!" said the Yankee, "there, there's that sheet of paper; take that away with you and decimal up its thickness, and take off whatever your measures make it." But until plans are drawn in which lines have length without breadth there can be an excess of accuracy, as is proved in this case. For when the machines were set to work in London they would not run. Everything fitted so exactly that nothing would turn round. There was hardly an allowance for air between the working surfaces, let alone a lubricant; and the spindles had to be eased, more or less undecimally, before a sheet could be printed. Then all went well, and the men of measurement and the men of shades shook hands.

For fifteen years the Hoes were supreme in the newspaper world. They were big, busy-looking complications, with a range of platforms on each side, a large central cylinder, a smaller impression cylinder for each platform, and a pile of flyers one above the other stroking down the sheets as they came shivering from each of the deliveries. The flat slab of type had gone; the type had now found its way round a cylinder; this cylinder in its revolution worked against from four to ten other cylinders, round each of which separately the sheets were fed and printed, so that every shelf did its own work. With ten platforms, though only one side could be printed at a time, an output of 8,000 copies per hour could be obtained. At first it

[1] See "Leisure Hour" for January. On page 169, in the third paragraph of the second column, the quotation should not end at "sir," but at "effect."

took twenty-five men to work it, but with the addition of the "flyers"—the waving gridirons that are so conspicuous in printing machinery—this number was reduced, the press then requiring the services of a man on each shelf, ten in all, as feeders, and four as removers, while two more were required to attend to the folding. Counting the overseer we have thus a staff of nineteen, and an average output of 420 copies per hour per man.

But there is no finality in machinery. About 1860 the process of printing from stereotype was first brought to perfection; and in 1862 a machine-shop was set up in the "Times" office, wherein Macdonald and Calverley began the building of the press named after the chief proprietor of that famous newspaper. With the Walter rotary, which replaced the Lightning in 1866, it became possible with an overseer and six unskilled hands to keep two machines going, each at the rate of 11,000 an hour, including stoppages, thus making the output 3,140 copies per hour per man.

The Walter owed its superiority to its printing from stereotype instead of from the "movable" type, and using paper in a continuous piece instead of cut up into separate sheets. The curving of the stereotype had been thought of by Cowper, but the difficulty was how to do it, his own plan not working satisfactorily. He also had thought of printing from the roll, but there had been difficulties in the way, not the least of which was the opposition of the Revenue authorities, who preferred to levy the duty on reams composed of so many sheets. It was only when the paper duty was repealed that printing from the reel had a fair chance—another instance of how taxation may choke a trade.

Printing from continuous paper is known as "web-printing," "roll-printing," or "reel-printing." Cowper was not the only one who had thought of it; but though the breath of inspiration does not always come from the Patent Office, it very often does so, and it is curious to note how that same mystic breath crosses and recrosses the Atlantic. Fifty-three years ago an American made a machine to print a duodecimo Robinson Crusoe from the *strip*. Forty-three years ago Applegath proposed to print from the *reel*. Thirty years ago a firm at Buffalo secured a patent for "printing from a *continuous piece of paper*." The jurors of our 1862 Exhibition reported that "the course of the sheet in laying on at the Hoe machine is as direct as it can be made, short of printing from a continuous *web*." Evidently web printing was in the air. On April 14th, 1863, a few months afterwards, William Bullock, of Pittsburg, Pennsylvania, patented his rotary machine "to print from a continuous *roll*." Some of the Bullock machines crossed to this country, and were worked to print the "Field" and other papers. In some quarters the Walter is claimed to be but a development of the Bullock; just as in others it is said to come from the Beach or Double Hoe.

Be this as it may—and it probably is untrue—the Walter takes us back even nearer to Nicholson than did the Lightning. The Lightning had the central type cylinder and the girdle of smaller impression cylinders; the Walter has a printing cylinder and an impression cylinder both of the same size. But in the Walter, the parts are duplicated so as to print both sides instead of only one. At the bottom is a type cylinder with inking rollers alongside; above this is an impression cylinder which the paper runs under; above that is another impression cylinder which the paper in reversal runs over; above that is another type cylinder with the inking arrangement; the cylinders, be it understood, being all four of the same size.

The reel of paper is over five miles long. It weighs 800 lb., and is sufficient for over 10,000 eight-page sheets of the newspaper. As it enters the machine it passes over a tension roller, and then, if it has not been damped in the reel, it goes over and under two steam damping cylinders; then it passes between two small rollers to steady it and save it from dragging; and then it runs over the upper impression cylinder, being printed on its upper side as it passes under the type cylinder above it. Travelling round the impression cylinder it is taken by its printed side round the lower impression cylinder and receives its second printing as it passes over the lower type cylinder below. As it passes round the lower impression cylinder the inked surface leaves more or less of a mark, and to prevent this being transferred to the paper again a drum of the same diameter as the impression cylinder removes the ink which is thus accumulated on the blanket, and this drum is then cleaned by a small absorbent roller. From the lower type cylinder the paper runs between two cutting cylinders, where the saw-edged knife in one of the cylinders perforates the web, which is almost immediately torn apart by two sets of rapidly-running tapes, one set of which travels faster than the other. The separate sheets are then taken down into the folding machine, from which the papers are delivered ready for sale. Such is the Walter press as used to-day to print the "Times," and, curiously enough, its present active antagonist, the "Daily News," and many others of the successful papers in the provinces and on the continent.

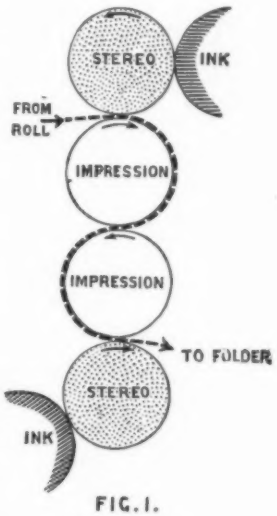


FIG. 1.
WALTER.

For a time it was the king of printing machines. But inventors were soon at work endeavouring to equal it. In full swing it runs off 12,000 an hour, and to get this 12,000 an hour in a somewhat similar way without unduly trespassing on the few

new details that had proved patentable was the object of the rival printing-press engineers.

At first the Walter delivered its papers unfolded. Here was the first opening. In 1870 the Victory came out, which not only delivers its papers folded, but counts them and delivers them in dozens or what not. The Victory is a favourite machine with country papers, all of which can be identified by the peculiar folding. Take up one of these papers, and you will find it folded in such a way that you have to open the first and last pages right out before you can get at the middle. The fold has its advantages, but the advantages are not at first apparent to the man in a hurry. In the Victory—at least in some forms—the paper after being damped passes between two rollers and over a board, so as to smooth it before it touches the type. The type cylinders are side by side with the impression cylinders below them, all four being of the same size. The paper runs along the top of the machine and then descends almost perpendicularly into it between the type cylinders. It runs backwards towards the reel to begin with, and is printed on one side as it passes round the impression cylinder; then it rises to the upper surface of the second impression cylinder and is printed on the other side, and then it is cut

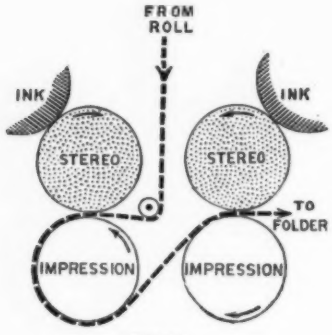

FIG. 2.

VICTORY.

lengthwise, folded once, cut crosswise, and then in separate sheets is dealt with by the folding apparatus, which delivers it along what looks like a series of desks on each side. In full career it can turn out 12,000 copies of an eight-page paper, or 24,000 copies of a four-page paper, per hour.

Close on the heels of the Victory, of which there are over 160 examples in use, came the Prestonian with movable type in a curved chase, which movable soon gave place to stereo. The Prestonian, which was introduced into London by the "Standard," had a capital folding arrangement, and this arrangement fitted to the "Daily News" machines gave the Walter press its present form. Of Prestonians, more or less improved, there are now about two dozen printing London newspapers. In them the impression cylinders are over each other, and the type cylinders are alongside them, but on opposite sides, the upper one being near the folders. The paper from a reel in the rear is led up over the machine, entering it perpendicularly about the centre, passing at once round the upper impression cylinder and getting printed; then it passes towards the rear over the

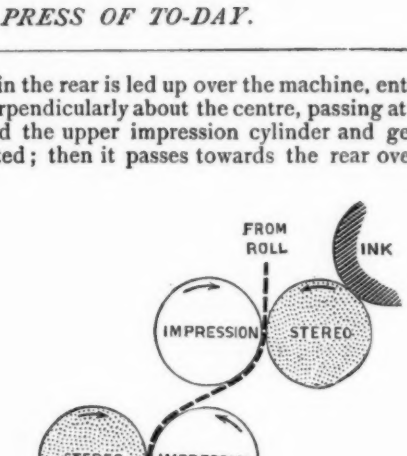

FIG. 3

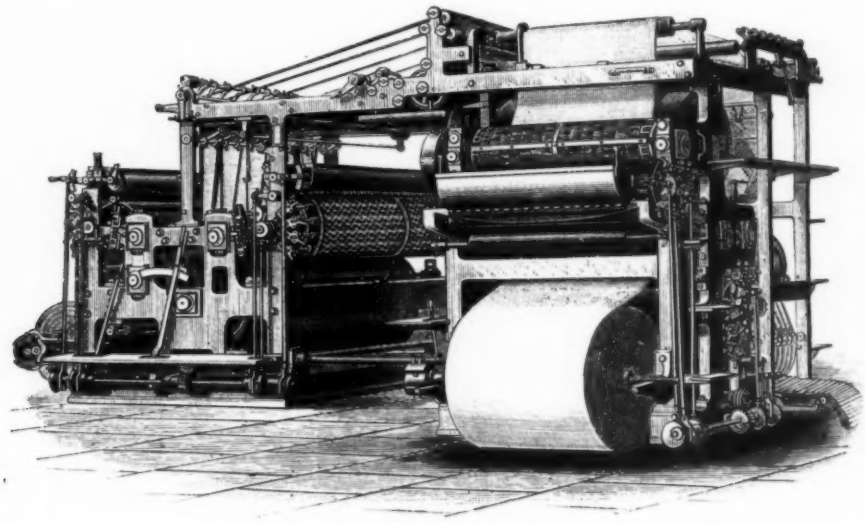
PRESTONIAN

under impression cylinder, and is printed on the other side; and then it travels along the base of the machine beneath the impression cylinders into the folder.

Two years after the Prestonian, that is in 1873, came the Marinoni web, which has its cylinders arranged as in the Walter, but with the inkers at the top and bottom. It need not detain us, for soon afterwards a more important new Hoe machine appeared in the market, which at once regained the lead that had for a time been held by the Walter. And now a much improved Hoe has appeared, the "Double Supplement Insetting Machine," which we may look upon as the leading rotary press of 1890. This machine prints from two rolls instead of one, and consequently gives twice the speed or twice the quantity of the early rotaries. It prints and delivers folded a sixteen-page paper at the rate of 24,000 copies an hour, and an eight-page paper at a rate of 48,000 an hour; and these copies are not only delivered folded, but are pasted together down the centre margins as if they were pamphlets, and counted out in dozens, quires, or any batches required. It is now nearly forty years since the first Lightning machine built in this country began to print "Lloyd's News." It was Mr. Lloyd of the "Daily Chronicle" who ran the first of the Hoe web machines, in 1873; and now it is Mr. Lloyd who has the first of these new "Quadruples" at work on a London daily newspaper. The "Chronicle," like the "Daily Telegraph," has always been a Hoe house, and both papers are now changing their machines for new ones as fast as they can be built.

There are now over 700 Hoe machines at work in the newspaper offices of both hemispheres, the greatest power being in the machine-room of the New York "World," where the output is 200,000 eight-page papers per hour. Most of the presses are made in New York, in a factory which is 1350 feet long, 100 feet wide, and from five to seven floors high, giving an area of five acres and a half; but all the English machines are made



throughout at the works in Mansfield Street, so familiar to what Mr. Sam Gerridge denominated "the nobility and gentry of the Borough Road." Here can be seen the patterns being made for the castings; the tools making tools to make tools to cut and bore the frames and gearing; the turning and the planing, and fitting and erecting; and, in short, the complete growth of a rotary from the drawing-office to the trial run. And there is accommodation for the building of six of the largest machines at the same time. Here they are built and tried, and then taken to pieces to be built again in the newspaper machine-room.

But we left our newspaper as it left the composing-room; let us follow it further. When the type reaches the foundry it is in flat chases, as it used to be of old. The stereotyper lightly oils it and lays a sheet of "flong" upon it. The flong is a pasty mass made by pasting together a few sheets of tissue, blotting, and brown paper. It is beaten into the type with a long-handled brush, or else rolled into it with an indiarubber roller. In this way a mould is taken of the whole area of type, and the mould is dried and placed in a casting-box, whose radius is the same as that of the printing cylinder. The box rests on its side in a frame, and its lid is balanced with a counterweight. A ladleful of stereo-metal —lead and antimony and "something else"—is taken from the melting pot and poured into the narrow mouth which extends all along the drum. Soon the mould is full and the metal runs over. It does not take long to cool. The lid is swung up; the bright casting is at once attacked by a saw and plane that trim its edges, and in a few minutes is in its place on the printing cylinder. In a quarter of an hour from the time of leaving the composing-room the castings will be fitted on the machine.

The machine is ready to start. We are to print a sixteen-page paper in duplicate on the new Quadruple Hoe. Both rolls, each double the width of the paper when open, have been rewound from the maker's roll and examined and damped in the reeling. They are each over six miles long, and have been threaded into place through the machine.

The word is given to go. A pull is applied to the levers as if we were starting the engine of an Atlantic liner. Slowly the wheels and drums begin to move, but every revolution is faster, and soon they are fully under way, and the wheels hum and the drums roar as the white stream seethes among them, and the folded journals throb feathering out at the end at the rate of 200 every half minute, being 24,000 an hour!

Watch the course of the main roll. It gets to

THE HOE QUADRUPLE PRESS.

business at once on top of the impression cylinder, takes the type, passes under the second impression cylinder (which is double the size of the other, so as to minimise the set-off), runs up the further side of it, gets its second printing, and hurries aloft into the folding frame. As it enters, it is cut longitudinally, and the two halves are turned outwards at half a right angle, and then turned inwards again, so that one runs under the other.

Now watch the side roll. That also is printed first on one side, then on the other. That also finds its way aloft, to be cut longitudinally. That also is turned outwards and inwards. But it is also turned away at a right angle, and in two halves, one above the other, slips in between the two halves of the main roll, so that four streams are travelling in parallel planes. The inner two have passed over a small disc revolving in a paste trough; and down the centre of each is a wet line like the track of a snail. Soon the two upper and the two lower approach one another.

They bend right and left. Their centres run over a former—a broad, smooth, sloping shelf of steel, in shape an equilateral triangle. The vertex of the triangle is a steel point worked by a stubborn spring. The point comes just in the centre of the paper, which droops on each side and folds downwards into half as it passes over it. As soon

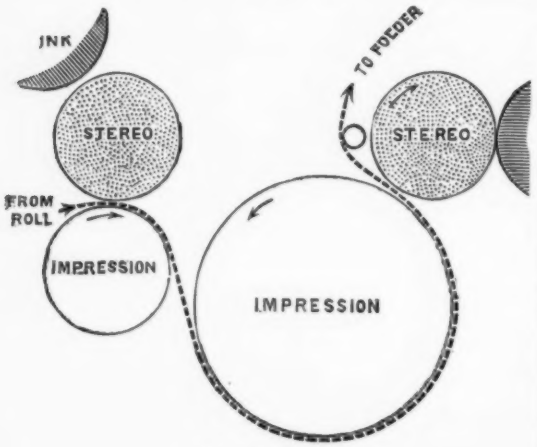


FIG. 4. HOE.

as the crease is complete the paper is again in trouble; it reaches a pair of cylinders carrying a double set of knives, which fold its end and cut the web just where the end comes, while the blades on the opposite cylinders crease the paper across the middle of the page, and thrust it between the small rollers, which give it the final mangle and hurry it out to the delivery.

The characteristic of the Hoe folding apparatus is that the movement is rotary throughout: the paper never goes back; its course is entirely an onward one, and the web is not cut until just as it leaves the folders. The result is that the paper supports itself all through the machine, and the tapework is reduced to a minimum. The reels of paper taken by these double machines are enormous. Those for the "Daily Chronicle" are 94¼ inches wide; but these are not the widest, for those used on the Philadelphia "Ledger," Mr. Childs's paper, are eight feet wide. Half-rolls can be used if desired; half the press can be used; no paste need be used unless required; the paper can be delivered in separate pages. In fact, there are many possible combinations of this useful contrivance, which, taken at its best, delivering the papers inset, pasted, cut top and bottom, turned out compact as a pamphlet, and, by an additional device much used in America, even folded and wrappered ready for post, is a veritable triumph of mechanism.

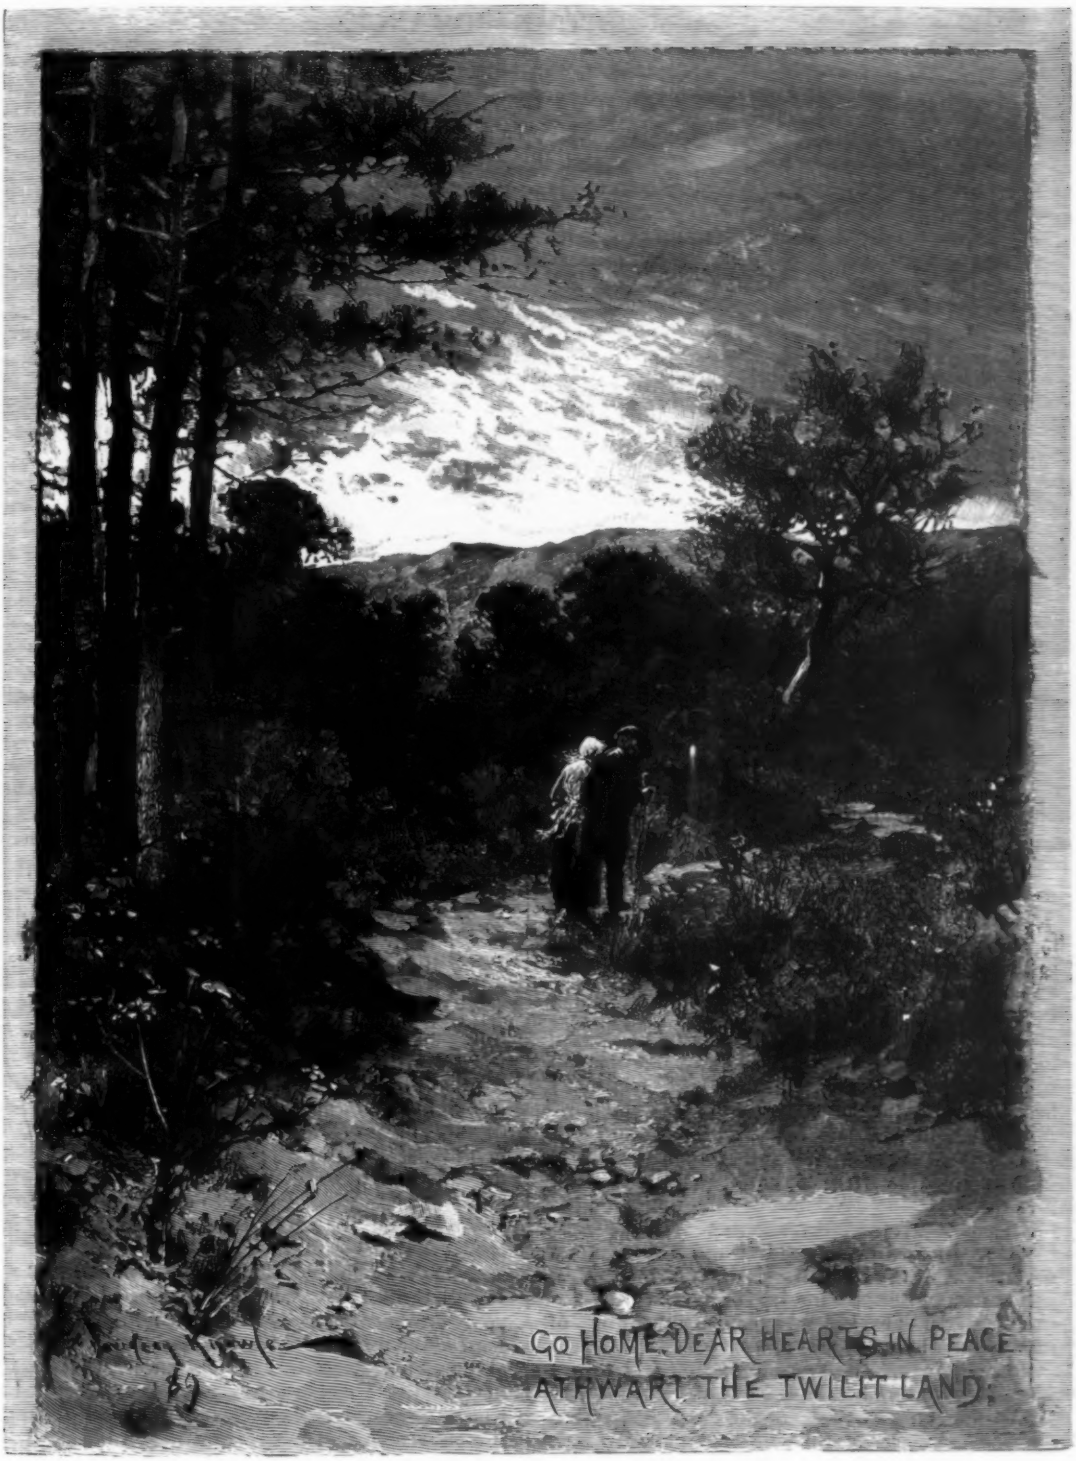
This is the latest of the Hoes, be it understood. The bulk of the machines used in newspaper work are not of this character; but the single rolls, single widths, and double widths now in use in most offices will all eventually be superseded. Hoes, Walters, Marinonis, Prestonians, and Victories divide the London work amongst them. Every paper has its reserve, so that the number of machines is not a satisfactory test of circulation; but taking them all together, it will be found to be no exaggeration to say that between two and four o'clock every week-day morning a thousand miles of London newspaper are given to the world by means of the rotary press.

W. J. GORDON.

## "Ye, Lovers Twain."

Ye, lovers twain, went home
Through tender deepening night,
But all your life to come
Looked to you one light.

One light indeed it is,
Or may be, if ye will;
Nay, trust your Lord for this,
In weal, in woe, and ill.

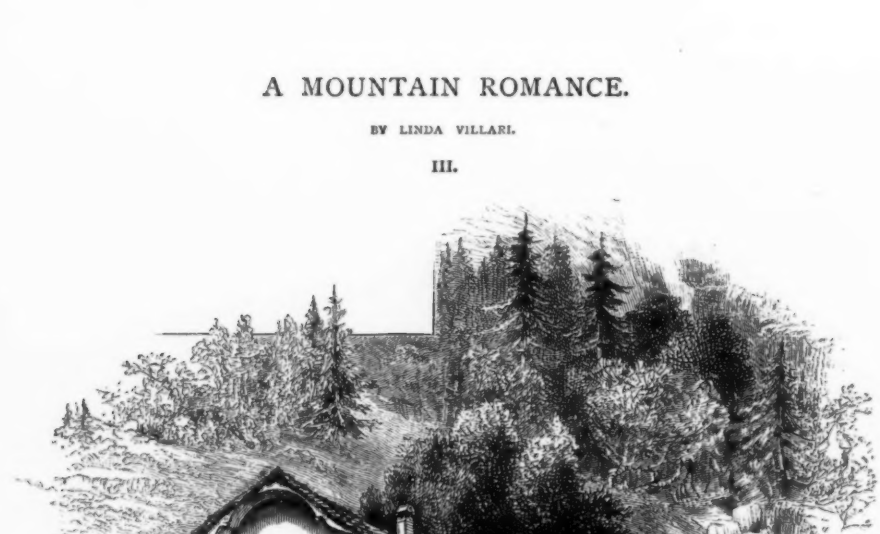


For night herself hath stars
More glorious than the sun;
Behind our cloudy bars
They are shining on.

Go home, dear hearts, in peace,
Athwart the twilit land;
Forest leaves ne'er cease
Soft sounds on either hand.

And if a tear fall low
From me who have lived long,
For loves of long ago,
Earth no more may know,
Faith sings Her undersong;

"They only seemed to die,
God numbered all and knew;
Beautiful they lie
In calm eternity,
Alive and fresh with dew."



RODEN NOEL.

GO HOME, DEAR HEARTS, IN PEACE
ATHWART THE TWILIT LAND;

# A MOUNTAIN ROMANCE.

BY LINDA VILLARI.

III.

PENSION AT GRESSONEY.

ELENA did not forget us. I was sketching the view from the balcony after breakfast when a big bunch of edelweiss and geraniums arrived, together with a note in a delicate, pointed handwriting, to remind me of our engagement for the afternoon. "Come here, Kit!" I cried; and Kit obediently appeared at the window. He was in his shirt-sleeves, unpacking his books, and looked so blithe and young after his long night's rest that I hesitated a moment before passing him the note. A horrible idea struck me. That beautiful girl with Nellie's eyes—what if my brother—but no—even in imagination I could not put the thought into words. He just glanced at the note, and his matter-of-fact reply was reassuring.

"Go, Joan, by all means, and bring me a description of the interior. I don't drink coffee, you know, and must write lots of letters."

Then—Kit always had a horrible gift of reading my thoughts—he added, gravely,

"Mind, Joan, I am not a fool, though I own I was upset yesterday by the strange resemblance. I can assure you there is no danger; your mind may be quite easy. I'll write you as many love scenes as you please, but don't be afraid of my acting any."

I blushed like a girl, exclaimed that he was a wizard, but could not refrain from adding, "The danger might be on the other side. You are handsomer now than when you were young."

"Worse and worse, my poor old Joan; the heat of Ivrea has muddled your brain. The hero of our Gressoney romance lives at Issime, and that swarthy Baron has a poor chance."

"I like the Doctor," said I, incoherently, relieved by Kit's declaration.

"So do I, but I shouldn't care to see much of him. Ever since I wrote that pathological novel last year I shun all of his profession. I never told you, I think, the effect of my medical researches. I am always detecting signs of disease in my fellow-creatures, forecasting the manner of their death; and whenever I see a doctor, I itch to consult him and verify my observations. Now I want to shake off the habit. It is painful to see people's doom written in their faces."

"Don't be morbid," I answered, in alarm, "or I shall think the success of your book has turned your brain. Besides, it is all nonsense; you must allow for the unforeseen, for battle, murder, and sudden death. I don't know what fatal disease you have kindly assigned to me or to yourself, but, you know, we might be thrown from our mules, or slip on the ice, or fall down a precipice on one of these steep mountains. And that can't be written on our faces!"

He laughed. "You are right there, Joan; the chance of some violent catastrophe is my

only diversion when I am seized with a fit of diagnosis." So saying, he went back to his books.

Like most clever men, Kit detested pension life, and shrank from being lionised by wandering English. Accordingly, he was relieved to find that our only fellow-guests were middle-class Italians; speaking no language save their own. I, on the contrary, was a little sorry, having hoped to find some congenial souls settled down, like ourselves, for a quiet summer. While sharing Kit's hatred for the tourist tribe in general, I knew one often met delightful people in these out of the way spots. Some of my best friends have been owed to chance meetings in hotels, and at any rate one may fall in with curious types and experiences. Then, too, one gets human companionship without the labour of society. One has no part to play, no duties either as inviter or invited. It was really disappointing not even to find the usual enterprising spinster, who has been everywhere, seen everything, and spent next to nothing.

So I set out for the Denabians' in a very social mood, and, stiff from my journey, walked slowly by the river-side, thoroughly enjoying the restfulness of the scene. The broad-eaved, high-roofed houses that clustered about the church suggested comfort and peace; the pleasant meadows were bathed in sunshine, spirals of smoke going up from homestead and cottage scattered here and there on the slopes; a quaint little belfry peeped forth from the larches higher up. Birds were singing, grasshoppers chirping, bees humming, cattle bells tinkling; there was a continual murmur of falling water, the stronger note of the river's flow; and now and then rending the placid symphony, as lightning rends the sky, a human voice rang forth from the mountains with a fantastic cry of cadenced laughter. Surely this was a happy valley, for even those grim grey crags overhanging the pine woods towards the head of the glen could not shut out the shining ice crests soaring to heaven beyond!

I was lingering on the bridge by the village, watching the swift rush of the Lys, and fascinated by its exquisite tint, when I heard Elena's voice at my ear. The nice little thing had come to meet me "lest I should miss my way." I gazed on her with motherly admiration. This sprightly maid, with petticoats of brilliant red cloth, black velvet bodice, puffs of soft muslin at neck and elbow, and a most coquettish little hat, was a different being from the shy, demure school-girl of the previous day, in her dingy brown convent frock. Now she danced by my side across the square, rejoicing in her new-won liberty, and anxiously asking what I thought of Gressoney.

First of all, I must see their cows, she said; and, passing the front entrance of the Denabian house, she led me round the corner to a smaller door, with a brass slit for letters in it. This was the stable, she said.

Did the Gressoney cows take in the letters? I wondered. But this door opened into a passage communicating with the house; the cow chamber —I cannot call it the cow stable—was to the left. Elena's boast about it was well justified. I found myself in a spacious hall lined with polished wood, and sweet with the perfume of well-kept kine. About a quarter of the space was screened off by a partition eight feet high, and this portion had flower-filled windows and was furnished with a long table, a couple of benches, carved cupboards, and several armchairs. As for the cows, they lived in state beyond the partition, each one railed off from its neighbour by polished wooden bars. The floor sloped slightly from either row of stalls to a streamlet of clear water running through the centre of the stable. There was an abundance of clean straw, the mangers were full of hay, and the sleek, well-fed beasts turned a placid gaze upon us as Elena patted them and told me their names. The rest of the cows were up at a mountain farm, she said, a lovely spot; she would like me to see it.

Then, explaining that the cosy stable-parlour was only used in winter, she led me upstairs to the summer saloon, a big wainscoted room, clumsily furnished with a few vile daubs of dead-and-gone Denabians on the walls. It had a cheerful outlook on to the square between the tiers of pelargoniums and hydrangeas arranged in the glass-covered verandah.

Here we found Tante Luisa, presiding over a huge silver coffee-pot. She was very kind and hospitable, and seemed very fond of her niece. But it was evident that what with rheumatism and household cares, she would be rather a dull companion for this lively young girl. So, with the selfish purpose of securing a good deal of Elena's society for myself, I made many advances to this rustic aunt, satisfied her curiosity as to my reasons for coming to Gressoney, also as to the number of my children and grandchildren, and listened meekly to a long account of all the aches and pains she suffered in winter.

Nevertheless, conversation presently flagged. I glanced round the room. "Where is your piano, my dear?" I said to Elena. "Sister Michela told me you were an excellent musician; I should much like to hear you play."

The girl flushed crimson. "Papa has sold our old piano to the hotel," she whispered hurriedly, "but I have asked him to buy me another."

"Eh, what?" broke in Tante Luisa. "A new piano! We must first hear what the grandmamma says."

Elena's eyes opened wide. "What has grandmamma to do with it?" she asked, impatiently.

"Bambina mia!" exclaimed the old lady with a frightened air, "take care what you say."

"Perhaps the Baroness wishes to give the new piano herself?" I suggested.

"Who knows what the Baroness wishes? But we have to consult her," sighed the old lady. "The other piano would have served for a time; it ought not to have been sold, for it belonged to the child's mother."

"I'll sing you something, if you wish, Madame Stewart," said the young girl; and standing before me, head erect, hands folded, she at once burst into a bird-like carol, beginning gaily, but sinking to a plaintive cadence at the end.

Her aunt's eyes filled with tears.

"Thy mother used to sing that, but it is only a little mountain melody. Try one of the fine pieces they taught thee at the convent, my child. That might please the English lady better."

I hastened to say I preferred folk-songs, while poor little Elena whispered to me that the others required an accompaniment.

When I presently rose to take leave I begged the old lady to allow her niece to come with me to the church.

"Surely, surely; show the lady thy mother's tomb," said the aunt, readily; "but do not be away long, lest the grandmamma should miss thee when she comes." And then, with renewed thanks, in her brother's name, for my care of "the child," the friendly woman insisted on hobbling downstairs to let me out by the brass-handled, little-used front-door.

As we walked up the lane to the church I asked Elena if she had seen the Doctor again.

She gave me a bright smile. Yes; he had come back from La Trinité early that morning and brought her flowers. She had added some of the edelweiss to my bouquet. She was sure I would like its soft white stars, and it did not grow in England, she knew.

"My brother and I have taken a great fancy to your old playmate," I said. "How nice for you to find him here!"

She blushed a little.

"Ye-es," she said, hesitatingly; "but oh, madame, it is not quite the same as when we were children. Grandmamma and my eldest cousin have quarrelled with poor Franz, and so papa and Tante Luisa don't like him to come much to the house. It is very sad."

I could not help remarking that this grandmamma seemed to be a very terrible person.

"No, no; only domineering," said Elena, with rather a watery smile. "You see, she is spoilt, just because people are afraid of her. It is strange—even my father submits to her in all things. She has been good to me, and I like her. But I will not quarrel with Franz on her account. He and I were always fast friends."

I had my own ideas as to what this friendship might become, but refrained from expressing them, and turned my attention to the primitive frescoes lining the arcade surrounding the grass-plot before the church. Elena's admiration for these daubs, especially for a saint with two left feet, proved that art had not been included in the convent course of study. After pointing out the granite obelisk to the memory of the grandfather who had perished on Monte Rosa, she led me into the church. It was rather spacious, very damp, and a faint breath of incense struggled unsuccessfully against the prevailing mustiness. A few brocaded banners propped against the walls and the red shirts and flowered kerchiefs of some kneeling women gave a little brightness to the humble interior.

"Isn't it a beautiful church?" whispered my companion, with much the same pride with which I have sometimes introduced transatlantic friends to the glories of Westminster Abbey. But the rosebud face and sweet eyes, turned so triumphantly towards me, made it easy to express the desired admiration. We were inspecting the tawdry ornaments of the high altar, when Kit suddenly appeared from the sacristy, accompanied by a priest and the black-browed Baron Felsen we had seen on the piazza. I looked attentively at the heir of the dreaded grandmother, and did not like what I saw in his face.

After the usual introductory courtesies, Kit plunged into a discussion with the French-speaking priest on the origin of Gressoney. One would have supposed he had dwelt in the valley for years, instead of hours, by the number of facts he had amassed.

Nevertheless, I only listened to the dialogue with half an ear; it was more interesting to watch the Baron's attempts to monopolise his cousin's attention. But Elena took refuge in nun-like demureness; all her vivacity had fled, and the Baron's bold glances failed to win any response from her downcast eyes. She plainly disliked the man. I began to think of hawks and doves. This little dove would do more than flutter, I was sure; her determined air of aloofness expressed some power of flight. Still, the chase might prove fierce, especially if the grandmother hawk should join in it.

"Hawk's eye!" exclaimed Kit, breaking suddenly on my reverie as we sauntered down the aisle. "Listen, Joan! Isn't that a more probable derivation than 'plaine de cresson,' as the guide books have it. 'Gresche ei—Gressoney.' Kindly tell my sister the legend of the egg."

"'Tis no legend, but simple history, madame," replied the priest, in his slow, pedantic French. "On the rebuilding of this church in 1773 an egg was found suspended from the vault, and inside it a slip of parchment, inscribed 'Laudatur Jesus Christus,' and dated 1515. And although this egg is said to have been larger than that of a hawk, and similar, in truth, to that of the domestic fowl, we may presume that it had been hung up to record the origin of our town. Nevertheless, madame, I should add that certain writers of note derive the name Gressoney from 'Gerosonio,' a corruption of Iersolis: that is, on the edge of the water, and cite an ancient document recording the donation of a tract of land named Ierosolis, on the banks of the Lys, the which tract was undoubtedly Gressoney. At a later date the Counts of Challants obtained from the Emperor of Germany the investiture of Issime and Gressoney, and received tribute from the inhabitants down to the year 1789. Now—"

"From whatever egg the name was hatched, your Gressoney is a fascinating place," I broke in rather flippantly, for, to tell the truth, I had had enough of the church, and was longing to be out in the sunshine again. But the curé was not easily thrown off his hobby."

"It is unlucky," he continued, "that St. John's Day is past. That is our great festival. Madame, you would have seen our poor church at its best, with all our banners and vestments displayed."

"Yes!" cried Elena, "then all the women wear

their marriage caps, crowns of beaten gold, often covered with jewels, and the Piazza is like a field of poppies with all the scarlet skirts. That is a sight only to be seen at Gressoney."

The priest smiled indulgently on the girl, but disposing, as it were, of her frivolous suggestions by a wave of the hand, resumed his antiquarian discourse.

"After the Benedictus on St. John's Day I distribute from the altar a small measure of wine to every member of the congregation. All sip a little on the spot, and carry away the rest to mix

CHURCH AT GRESSONEY.

with their store. This usage has come down to us from our Teutonic ancestors, and is founded on an incident in the life of our blessed patron. A hardened idolater named Aristomedes gave poisoned wine to St. John, promising to become a Christian if the draught were swallowed with impunity. The saint drank it unharmed, and Aristomedes was converted to the true faith."

"A drinking party in church is a new idea," said Kit to me *sotto voce*, as he scribbled a few words in his note-book; "I should like to see the ceremony."

The Baron overheard him. "It's an indecent practice," he said, gruffly, "and will soon be put down. The curé is too timid to stop it himself, but my brother and I have notified the bishop of the drunkenness caused by it."

"What, in church?" I said, horrified.

"No, the curé's gift is too small for that, but it gives a religious sanction to excess the rest of the day."

The curé's wrinkled cheeks reddened with annoyance. He turned sharply towards the Baron, then checking himself with an effort, remarked in a suspiciously meek voice—

"Baron Felsen is a little hard on my poor flock; they have their faults like other mortals—one must not expect to find all vices confined to the higher classes—but on the whole, they are a sober, upright, God-fearing community."

Elena listened to the priest with approving eyes; the Baron turned aside with a snort. Then the girl led me out into the little graveyard to show me her mother's tomb. The peaceful flower-grown enclosure, within sound of the river and guarded by solemn peaks, seemed a fitting resting-place for the dead. Meanwhile my one-day's friend was twining herself round my heart by the trust with which she appealed to my sympathy in speaking of her mother. As a rule, we elderly folks are kept at arm's-length by the young, and too often reminded that our years are a barrier shutting us off from their confidence. They seldom remember we too were young once. Accordingly I was flattered by the spontaneity with which Elena gave herself away; I felt concerned for her. What would be her lot? She seemed a fragile little blossom set among rough weeds. The kindly aunt would be no great support, I fancied, against boorish father and despotic grandparent. Then I told myself I was an old goose. All that seemed terrible to me might be a matter of course to this simple girl. I did not know her point of view, and remembered the impossibility of gauging the feelings of even our nearest and dearest. Let me be content to show what kindness I could to this child with Nellie's eyes, and leave the rest to Providence. My pity was probably wasted.

So, illogically enough, I was specially tender to my new friend, and proceeded to plan expeditions with her. The terrible grandmother had commanded her presence at Chamonal, some miles off, the following day, and she might have to stay there, but would come to see me on her return. Now, unless I was too tired, she would take me to a wonderful spring, one of the sights of the valley.

On leaving the churchyard we were joined by Kit, who had at last torn himself away from the priest; so after calling at the post for our letters, we three followed a stony lane to the edge of the woods. Elena's spring was in the cellar of a ruinous shanty amid a chaos of rocks. It was a deep pool of the clearest, coldest water, but not otherwise remarkable. The girl, however, enthusiastically declared there was none like it in the

world. It was always the same, summer and winter, and the stream running from it through the meadows was always pure as crystal. We were willing to take its marvels for granted without following its course to the Lys. It was pleasanter to rest under the larches, where woodpeckers were at work, and gaze on the valley in dreamy content, while Kit glanced at his letters and Elena told tales of childish freaks, in which her friend Franz seemed to have played the principal part

IV.

MORE than a week passed without sight of our girl friend, but we were not without news of her. She was still at Chamonal with her grandmother, and the latter had been ill and obliged to call in Dr. Bondaz. We were continually meeting this young man riding up and down the valley, and, considering the extent of his practice, he seemed to devote a surprising amount of care to the old lady's ailments. He was never too hurried to pull up for a chat, and his conversation invariably turned upon Elena Denabian, her sweetness, her beauty, her accomplishments.

Meanwhile I had gleaned much information from the mistress of our inn. Baroness Felsen was the despot of Gressoney, but a beneficent despot when left unopposed. It was considered a great thing for Dr. Bondaz to have been called to the castle, a certificate of merit worth more than all the diplomas he had brought from Turin. When I suggested that, seeing there was no other practitioner within reach, the Baroness had little choice in the matter, my hostess assumed an air of mystery and said,

"The signora does not understand. It is a strange story. Baroness Felsen was furious at the Doctor's return to the valley; people say she offered him a large sum of money on condition that he settled elsewhere."

"What had he done to offend her?" I inquired. "He is a relation, is he not? Miss Denabian told me he was brought up with the family."

"Well, you see, this is how it is," whispered the hostess, with an air of mystery, and thereupon poured out a long rambling tale, from which I disentangled the history of a great wrong. Many years back the Baroness adopted an orphan niece and educated her with her own children. The eldest son, the present Baron's father, wished to marry this cousin, but as she had not a penny his mother forbade the match. There were tremendous scenes at the castle; the young man went abroad with a friend named Bondaz, and shortly afterwards the cousin disappeared. It was rumoured that she had been sent to a convent. Two or three years later the young Baron came home with a bride of his mother's choice, and a few months afterwards his friend Bondaz reappeared with a baby-boy and settled down at Noversch, the other side of the valley. This Bondaz was a harum-scarum ne'er-do-well, who had squandered all his fortune before he went to travel with the Baron. But now his purse seemed full, and he was gayer and wilder than ever, though he could not have long buried his unknown foreign wife. He was always up at the castle, and as time went on his boy was always there too. Indeed, the old Baroness seemed to regard the spirited little Bondaz with more favour than she bestowed on her own grandchildren. The young Baron's wife died after a few years, and then her husband went away again and was scarcely ever seen here until, his health failing, he came back, and, trusting to the virtues of his native air, planned the fine house by the river now being finished for his son. At this point I naturally interrupted the hostess to ask what all this had to do with Dr. Franz.

"Just this," she continued, excitedly. "Some say that his father's unknown wife was no other than the Demoiselle Felsen, who had so strangely disappeared; but the general opinion is that Bondaz was never married, never had a child, and that the late Baron, when dying, acknowledged Franz to be his own legitimate son, the offspring of a secret marriage with his cousin. It is also rumoured that he made his mother swear to reveal the truth, but that she broke her oath, and destroyed the documents entrusted to her care. Anyhow, Franz is still known as Franz Bondaz. The Baroness did all in her power to keep him away from the valley, and refused him admittance at the castle until frightened, the other day, into recourse to his skill. Whether he knows the tale or not, no one is aware; he asserts no claims, seems quite contented with his lot. Probably old Bondaz, who died a month before the Baron, kept silent to the end. So the Baroness is sole mistress of the family secret, and her eldest grandson is likely to remain a village doctor to the end of his days."

I mused over the strange tale, while the good woman poured out a flood of small details. "Of course," she added, "there might be some gossip mixed up with the story, but that Franz had Felsen blood in his veins was proved by his face. There was a portrait of the late Baron in the new house, and no one could look at it without being convinced of the Doctor's parentage."

As it chanced, I had an early opportunity of testing this point of the Gressoney romance; for meeting the Baron by his own gate the same afternoon, he greeted us with effusive politeness, saying that he was on his way to call on us with a message from the Baroness. Would we waive ceremony, as she was not strong enough to call in person, and come to breakfast with her the following day at Chamonal? She was anxious to express her gratitude for our goodness to her grandchild. We accepted at once, for Kit shared my eagerness to behold the redoubtable though, if report spoke truly, most wicked old woman.

And then the Baron forestalled our request to see his house by pressing us to inspect some wood carvings that had just been put up. As strangers, we might be interested to see the skill of the Gressoney workmen. Everything else was still in confusion, nothing worth showing, and so on. It was plain, however, that the young man was very proud of his fine mansion. He led us

up a carved staircase fit for a palace, and on the landing, surrounded by trophies of the chase, hung the portrait to which my hostess had referred. It represented a handsome middle-aged man in Tyrolese dress, seated on a rock with a dead chamois at his feet. It was a startling likeness of Dr. Franz, save that the hair was coal-black instead of golden-brown.

"Why, it might be—" began Kit, but I hastily silenced him by pinching his arm.

"It is a fine painting, I believe," said the Baron, "and the best portrait we have of my father. It was done in Bavaria, where he lived many years. This house, as you see, is of German design. The Baroness insisted on carrying out my father's plans, though for my own part I was content with the old home on the Piazza. The latter," he added, "was to be renovated for the use of his younger brother when the latter had completed his term of military service."

He then led us through the interior, and seemed pleased by our frank admiration of its luxury. The rooms were well-proportioned, the carved ceilings and wainscots in excellent taste. As we picked our way through carpenters' litter to the yet unfurnished reception-rooms, I wondered whether Elena was destined to own them. But this heavy, unattractive young man was by no means worthy of that charming little girl. Even my brother's conversational gifts failed to strike a spark from him. He did not seem to have an idea in his head excepting on the subject of horseflesh and sport. Nevertheless he was friendly enough in his dull way, offered to mount us for our trip to Chamonal, and was surprised to hear that we preferred to go on foot. From the broad terrace overlooking the valley he pointed out the haunts of his chamois and bouquetins on the heights above. He carefully preserved them, he said, and if King Umberto cared to visit Gressoney he would guarantee that his Majesty should have excellent sport. Would we like to see the bouquetin? He would have them brought down from the hills some day, for with one of his keepers they were as tame as sheep.

Once outside the gates, I asked Kit what he thought of the portrait.

"What can I think? That ugly story is probably true. I wonder what the Doctor has to say to it! But, mind you, Joan, the Baron knows nothing; I scrutinised him closely, and am certain of that."

Later in the day I was toiling homewards, laden with flowers, through the glen behind the hotel, when Dr. Bondaz came out of a cottage by the mill, and immediately hurried to join me. He had just come down from Chamonal, and Signorina Elena was looking forward to my visit on the morrow.

I asked whether he would be there. He smiled rather sadly.

"No, worse luck! The old lady has been so quickly cured that I have no occasion to go there again."

I could not help remarking that, in case we ever needed his services, it was a comfort to know that we should not have to send for him all the way to Issime. He had a large practice, evidently, in and about Gressoney.

His sun-burnt face looked a shade redder as he quickly replied, "Of course, madame, there are many strangers in the valley now. Had I the choice, I should live at Gressoney: it is my old home; but most of my time is spent in the saddle."

We were near the inn stable now, and at a whistle from the Doctor his horse was brought out.

I was patting its rough neck when my companion said, hesitatingly, as he untwisted the reins: "Madame, may I—will you forgive me if I make a strange request? But you have been so kind to her—to Elena Denabian—you English

A GIRL OF THE VALLEY.

are so strong and sensible—could you, would you, give her a word of advice? She is young and guileless; she does not know that her father and grandmother have decided to marry her to Baron Carlo. It comes badly from me, perhaps; but believe me, dear lady, he is unworthy of her. Urge her to be firm—to consent to nothing until her heart speaks. Will you do this?"

Here was an embarrassing mission!

"My dear Doctor," I said bluntly, "I quite understand and sympathise. But how can I, a stranger, venture to touch on so delicate a point?"

"Ah, madame! Then what can be done? Who will warn the poor child, and put her on her guard?" he cried, with a look in his eyes that went to my heart.

Thereupon impulse won the day, and I did a foolish thing. Pressing his hand warmly, I said:

"Why need she be warned? It would only alarm her. When you have spoken with her a few times—well, who knows, she may find the

best of reasons for rejecting the Baron. That seems the simplest way."

"Oh, madame!"—and this impetuous young man positively kissed my elderly hand—"you are an angel; you know everything. Yes, I have loved her all my life; came back from Turin for her sake, and—and I *think* she likes me. But I am poor; she is rich. This is a cruel world; there is no hope. But *you* will help me, dear madame!"

And with this incoherent speech the poor Doctor swung himself into the saddle and trotted briskly down the path to the road.

We were in the second act of the Gressoney drama.

When I told Christopher what had passed, he raised his eyebrows, and asked how I should dare to face the grandmother now. But he heartily espoused the Doctor's cause, and agreed that to see him married with Elena would be the best punishment for the old woman's crimes.

I must confess to having felt some sinking of the heart when we started for Chamonal the following morning, but motion and fresh air soon strengthened my nerves, and made me ready to face a tigress. After all, the gloomy forests, stern peaks, and jagged ice-crests at the head of the glen were only a background to the jocund summer scene! Did not children's play, and the drama of love and life, go on, as elsewhere, beneath those frowning heights?

Instead of taking the road through the village, we kept by the river as long as we could, fascinated by the rush of its sparkling flood. Then, skirting flowery slopes and crossing a ravine, our track soon led past a brewery, where the mountain-side was feathered with larches, and across more pastures to another gully, where a cascade plunged down from a beetling crag.

Here Kit halted, pointing to a green patch far above. "That is where the best edelweiss grows," he said. "I mean to climb there one day—but not with you, Joan, for I am told that it is a most slippery, dangerous slope."

"No fear of my attempting it, Kit; only a fly could scale those evil-looking rocks."

But Kit's botanical ardour was stirred, and he stood pondering.

"There must be a track to it higher up through the wood. I shall certainly try it, but with a guide. If one's foot slipped—"

But I interrupted him by suggesting that we must hurry on if we wished to reach Chamonal before noon. After threading a chaos of rocks and a little copse, where the mountain-wall above us pressed close to the stream, the valley suddenly widened out. There were broad-eaved homesteads here and there among the meadows, hamlets clustered in the folds of the hills, mist-wreaths floated about the hoary Grauhaupt, the Lys wound like a silver snake through the sunlit vale. It was strange in this Alpine scene to find a British turnstile obstructing our path; and beyond it a neat bridge led from the meadows to a stout mansion across the stream. Surely this must be Chamonal. No; a friendly herdsman solved our perplexities, and put us on the right road.

Taking a steep path by a torrent almost to the mouth of its parent gorge, and then turning off through a village, the square, grey mass of Castle Felsen suddenly came into view on a projecting crag. There was still another ravine to be crossed, but a well-beaten mule-path soon brought us to the gates. But why was the old feudal stronghold we expected to see replaced by this bald modern building? This noble site demanded turrets and battlements! Evidently young Gressoney had no eye for architectural effect.

The wide paved terrace in front of the house was at the edge of the precipice overhanging the valley, and we paused a moment to revel in the view, as well as to gain breath before making our entrance.

Suddenly the great door flew open unbidden; a slender, red-shirted figure came dancing down the steps with a cry of delight; on the threshold stood a tall, grim, white-haired woman, leaning on the Baron's arm, and several serving-men were ranged in a row behind. It was an awe-striking welcome to a country lunch!

The Baroness greeted us graciously enough, but with a certain impressive affability, as of a sovereign receiving her subjects. I no longer wondered at this lady's influence over her family. There was power in every line of her stern white face. It was an aged face, worn and seamed by a criss-cross of wrinkles, but her glance was full of vigour and her eyebrows coal-black. The gloomy entrance-hall, bare of all ornament save a few antiquated muskets, arranged between iron sconces on either side of a cavernous hearth, was a suitable background to this dark, gaunt, fierce-looking dame.

After congratulating me on my strength in coming so far on foot, and noting—rather contemptuously, I thought—my heated condition, she consigned me to Elena's care, and I was led up many stairs to a pleasant corner room, flooded with sunshine, and with all the glories of the valley in full view from the windows.

"Grandmamma must not know I have dragged you up here," said the girl, laughingly, as she relieved me of my cloak. "I was ordered to lead you to the state-room, but that always gives one the shivers."

I assured her I preferred this bright little eyrie, and, noticing a vase of rare mountain flowers, asked if they grew near the castle.

"No, Franz had brought them," she replied, flushing a little as she bent over the gift.

I told her I had heard of the Doctor's visits, and hoped the Baroness had overcome her dislike for him.

The girl seemed embarrassed as she slowly replied, "I don't know. Sometimes she is kind—just as when he was a child—then suddenly seems to detest him. But I am sure she appreciates his skill. Shall we go down now, dear madame?"

# A DAY IN A HOSPITAL.

IN the heart of the City of London, scarcely a stone's throw from the Bank and Royal Exchange, and within easy reach of St. Paul's on the one side and the Tower and Port of London on the other, stands the Royal London Ophthalmic Hospital, better known perhaps as the Moorfields Eye Hospital. An uglier or more unpretentious building of its size could hardly be found, and it might easily be mistaken for one of the group of warehouses by which it is surrounded were it not for the large black letters running along its face which announce its character, less, as may be seen at a glance, from any desire for ostentation than that he who runs may read. Indeed, something in the very aspect of the unattractive building seems at once to speak of the spirit which animates it. You feel instinctively that the uncompromising black letters are there that people in distress should not lose one unnecessary moment in finding it, and that the energy within has left nothing for outward adornment; in fact, that, so far in character with its surroundings, it is truly a place of business.

But if such were your feelings standing with the roar and rattle of the streets around you, once within the walls nothing you saw could fail to impress it upon you more deeply. Passing in through the out-patients' entrance you would find yourself suddenly in a large irregularly shaped waiting-room, surrounded by a dense crowd of human beings, filling every available seat and clustering round the benches in little groups.

Such was the scene that met my gaze one hot morning in August, when, to my surprise, I was told the hospital was at its slackest, owing to house-cleaning being in full swing.

"Very full here this morning!" I suggested to my guide.

"No," he answered; "we've often more than this; there must be about 400 here now."

"And how many mornings a week is this?" I asked again.

"How many mornings?" and my guide laughed; "why, every morning to be sure."

I looked around again, the crowd striking me afresh as my eyes wandered from face to face.

"You must want a great many doctors to see all these people," I observed.

"Oh, yes," the answer came; "there are three of the surgeons at it four or five hours every morning, and their assistants besides. They begin at 9.30, and go on till 2; but these people often come by 8 o'clock, and wait here before the doctors come, and then have to wait their turn. There is a coffee-stall here for them," and he showed me a neat little refreshment stall at which tea and coffee and appetising bread and buns might be purchased at a moderate cost.

"Some of them come a long way," he explained. And then a bell rang and my guide vanished, leaving me to try and take in a little more fully the scene before me.

As I watched the crowd from my corner I noticed that by far the greater part evidently consisted of members of the working class—though within these limits almost every grade seemed represented. From the well-dressed foreman or clerk and the skilled artisan to the poorest fish-porter or dock labourer, almost every degree in the scale of hard living might have been found. Sailors, stokers, lightermen, cabmen, or street arab—all were united here in a common need, and sat awaiting their turn with stoical patience or ill-suppressed anxiety.

On the women's side little groups clustered together, talking over their common troubles: busy mothers, baby in arms, who had evidently been obliged to bring several of the younger children, too, with them, one of whom perhaps by the bandaged head revealed the patient of the family—all clinging to her dress, or seated solemn and awed upon the benches. Here a pale-faced work girl sat watching the door anxiously through which her summons would come. Another with bare head and crossed shawl, her hand to her eye, was spoken of sympathetically by a neighbour.

"Ee give 'er that last Sunday, and it's gone bad, so she were bound to come."

On almost all the faces poverty and a hard and struggling life had left its mark, though here and there dress or manner betrayed a more educated class. The number of children was striking, and I noticed painfully that of these the majority were not there as necessary appendages of their mothers, but were evidently themselves the sufferers. Nowhere before had such a scene met my gaze except on the bare waiting-stage at Liverpool, where the passengers by a large emigrant ship were gathered previous to their embarkation. I noticed with painful curiosity the same signs of hardship, the same differences within the same scale of poverty, and the same curious mixture of apathy or vivid anxiety on the different faces. As my eye grew more accustomed to the scene I joined one or other of the groups, and drew from one here or there the cause that had brought them to the hospital. It was touching to observe the almost universal patience of their attitude towards their affliction. "If only, please God, my other eye is spared." "If only I gets back the sight enough to go back to my work." "I'm afeard its gone so bad I shall have to come into the hospital," ended one woman with a heavy sigh, after a matter-of-fact uncomplaining recital of terrible suffering. But her trouble was not for herself; and in answer to my suggestion that she would probably be far more comfortable, and have a better chance of recovery there than at home, it found a simple expression—"It's the six children I'm thinking of."

We are fond of saying that the age of heroism is dead, and put ourselves to a great deal of trouble to search out teachers and examples in the past, but I venture to think that both might be found without difficulty in the waiting-room of the Moorfields Hospital, as one by one they pass through the door to what may be a life's verdict.

To follow them was to exchange this theatre of waiting and suspense for one of equal activity. A large room, lighted from the side and roof after the manner of a studio, was more than half full of patients, moving up in single file to receive in their turn the attention of the three surgeons standing at separate desks in different parts of the room. And here the concentration and intentness with which everything was done was most striking. Not a moment seemed lost, yet nowhere was there the smallest sign of hurry. Each case seemed to occupy wholly and completely the attention of the surgeon, as though to it attached some individual interest, and then they passed on, one by one, either into the care of one of the assistants for further examination, or to have a written order for spectacles or a prescription assigned to them. Of these assistants there seemed about half a dozen in attendance upon each surgeon, and I learned that far from being junior students they were all fully qualified medical men.

By the courtesy of the officials I was allowed to pass on with some of the patients to a room beyond, artificially darkened, with jets of gas arranged in such a way as to throw the strongest light upon the eye. Here the deeper parts of the eye invisible without the ophthalmoscope are examined, and often with the most important results. This, I was told, was a place full of terror at first to the nervous and apprehensive amongst the sufferers, and I heard the doctors reassuring the timid amongst them, and at last convincing them that they would be safe and unharmed.

From there I passed into the wards upstairs, fifteen in number, and containing nearly one hundred beds, and it was here, perhaps, by quiet talks with one after another of the patients that the real magnitude of the work the hospital is doing began to impress itself upon me. The darkened cataract wards were perhaps the most interesting. Of the victims of this scourge several hundreds have been operated upon every year, and it is calculated that upon an average one patient leaves the hospital every day of the year cured of cataract. Some texts are better than the sermons that follow them, and this is a fact which needs no commentary. It was touching to notice how many children had already been treated for this malady, and I was told it was very prevalent amongst them, and far more likely to be cured than at a later period of life. It is the pride of the hospital that one of its most eminent surgeons first adapted the operation for cataract to the conditions of infancy.

Expecting as I did to find in so truly a metropolitan hospital patients drawn solely or chiefly from London and its suburbs, I was amazed even in the first ward I entered to notice its cosmopolitan character, and the long distances that some of the inmates had come. A stately old country woman of over eighty sat with bandaged head in her chair, and seemed pleased to find one to whom the country was also dear. She came from the neighbourhood of Southampton, and gave a simple and touching account of the slow darkness that had crept over her, daily growing worse, till at last she was too helpless to bear it longer without an effort. She had always been used to do for herself, she explained, and her sons and daughters had enough to do about the place without minding her. And so, after long consultations together, the poor simple-minded old woman, who had scarcely been in a train before, had decided to take this journey to London, as she heard the Moorfields Hospital was the best in the world, to see if she could not be saved from total blindness and dependence. "They wanted, one or other of 'em," she said, "to have come up with me, but they had their work to mind, so I wouldn't hear of it. I told 'em I shouldn't come to no harm," she added with simple bravery, "and people was very kind on the way. But there, the noise and dirt coming across London, I couldn't believe!" and she held up the two wrinkled old hands in dismay which had lain on her large white country apron. I put some flowers into them, and her face broke into a smile as, smelling them, she said, "Roses, bean't they? And here's mignonette!" And we fell into talks about the fields of strawberry-beds and flowers of her country home. And this brave old soul was going back alone, as she had come, thanking God for all the gentlemen's and nurses' kindness to her, and that she was spared, at over eighty, from being a burden on her children.

In an opposite bed was a Welsh woman, and here again was the same story.

"At my business," she explained, "you can't get on without your eyesight, and it was all leaving me." So, acting on the advice of her local doctor, she, too, braved the long unfamiliar journey, with a strange hospital and certain operation before her, driven by the horrible darkness and worse fears that were creeping over her, and the absolute need to make her livelihood, "with others to keep," as she explained.

Another old woman, too deaf to hear anything without the aid of an ear-trumpet, apologised for her anxiety to save the sight of one eye, if possible, on the ground of her deafness making it "so very awkward."

In another bed was a poor sempstress, whose sufferings had evidently been extreme, and whose case had been a stubborn and, I should fear, rather hopeless one. She spoke with a resignation, doubly touching from its unconsciousness, of her thankfulness if in any way they could save the partial sight of one eye.

But it would be useless to multiply cases. In all there seemed the same story to be read: of a courageous fight against terrible odds, poverty and disease going hand in hand, and combining against each poor sufferer, who, when driven at last to bay, found the same refuge and help within the hospital walls. In one's easy life and pro-

sperous circumstances even the thought of partial blindness is almost like a touch of physical pain; yet here one sees it met with uncomplaining fortitude, where the absence of sight implies the impossibility of gaining even the bare necessaries of life.

In the other wards it was the same story repeated in varying forms. Poor sempstresses, wondering if they would ever get back their place; poor mothers lying helpless in bed, with the thought of the children at home heavy on their hearts, left often enough in some almost unknown woman's hands.

"I suppose your husband brings them to see you, or comes and tells you about them?" I suggested, in the hope of comforting one such helpless mother.

"He can't afford to leave his work to come," was the answer. "He's got a job, you see, now, and it wouldn't do to risk being turned off. It's going on for a fortnight now since I heard of them," she added, "and the baby only ten weeks old."

One talks of poverty as comparative; a case like this makes one feel what it really means.

At one point a scuffle of little feet was heard, and a childish voice, "Oh, Sister, may I run in the passage?" And then when permission was given a patter and scamper of feet and sounds of children's laughter, and then two little bandaged heads and merry faces peeping in round the open door.

"You must come up to the children's wards before you go," said the kindly Sister, and thither I followed her.

Lying in bed, sitting demurely in little chairs, with picture books, or playing on the floor, were children of every age from one to eight or nine, and the Sister, in answer to my expression of surprise, informed me that there is no limit of age in the hospital, and amongst the patients lately every age had been represented from five days old to ninety years! The ward was a bright, cheery upper room, and despite the bandaged heads there was no great air of invalidism amongst the children. The worst cases were in another room, where in the partial darkness the little forms looked very piteous lying side by side; here, one whose eye had been removed yesterday; there, an almost hopeless case, needing the greatest care, I was told. But in the other ward, full as it was, only one bed was occupied, and that for a complaint easy of cure!

"Poor little fellow!" the Sister explained, "his clothes were in such a state I had to have them washed, and so meanwhile, as he has no others, I am obliged to keep him in bed."

Would mothers of sturdy fast-growing children remember this, I wonder? and the little suits or frocks that have grown too small or shabby for Tommy would be a boon to some restless little fellow longing to be up and about and at play, and condemned to his bed for want of them. Old toys would not be amiss here, either. Let the despised dollies and tailless horses worse for wear find their way to the children's wards.

One little fellow sat so solemnly on his little chair, with the one great blue eye unconcealed by the bandage fixed upon my face, that I knelt beside him and vainly tried to get some response.

"That is a little German boy," said the Sister, "and we find it very hard to make him understand."

I brought my few words of German to the front, and he was happily uncritical enough for a solemn shy smile at last to reward my efforts, though not a word would he say to me. Another little chap held a long colloquy with me on the subject of his buttons, which in an unguarded moment I had alluded to as brass, but which I found were cherished as of pure gold. Meanwhile the veriest imp of the streets, a creature not yet two, sat with a wizen, sharp little face and such mere bits of bone for arms and legs, my heart was moved to pity. I tried to coax him with a flower, but with a dash of sudden mischief it was torn to bits and flung in my face, and then the bony little fingers were spread over his face, and his poor weak little eyes peered at me through them. Poor mite! he looked the incarnation of sickliness and precocity, born, as one felt, to moral if not physical destruction, should no kindly hand snatch him from his surroundings. To the Sister he showed his devotion by howling dolefully every time she left the ward, and refusing with violence to be comforted by anyone else.

But here an interruption came in the shape of a messenger asking the nurse to get her patients ready, as Mr. —— (the operating surgeon) would be upstairs now in about ten minutes. One could not escape an involuntary shudder. And yet such are the wonderful properties of the newly discovered cocaine that the operating theatre is robbed of half its terrors. Quite two-thirds of the operations at the hospital are now done under it, and in most cases quite painlessly. It is to the honour of the Moorfields Hospital that it was first used in England within its walls.

I followed one of the nurses downstairs after a time, and saw the little group of patients gathered in the lobby-room outside the theatre, awaiting their turn.

"That is the worst place of all, and the worst time," I was told; and it was impossible not to feel it, as one watched the nurses with their quiet manner inspiring their patients with courage and confidence as they dropped the magic drug into the eye which was to deaden and allay the pain. The door opened as I waited, and a little child, whose eye had just been removed, was carried out in the arms of a nurse, still under the influence of an opiate. Thoughts must turn to prayer before such spectacles of human suffering and endurance.

Nor was the endurance displayed by the patients alone striking. To anyone unfamiliar with hospital life, it might well seem noteworthy that operations requiring the greatest nerve and technical dexterity should be performed by the same surgeons who for hours already had been giving the most concentrated attention to the out-patients' cases below.

In passing on into the men's wards I found the

same diversity of occupation, and even of nationality, that had struck me on entering the out-patients' room. Here a cabman, who, from his readiness to hold forth to the rest on any subject, had won for himself the title of "Teacher;" there, a negro; in another bed, a poor fellow in a terrible plight, just off a long voyage, on which he had acted as stoker. Near him a lighterman from the river, suffering in much the same way; and in the darkest corner of the room a cheery Finnish sailor, who was better, and hoping soon to be afloat again. One patient had lately come all the way from the Cape. He feared that he was totally losing his eyesight; and his anxiety being very great, he determined to spare no effort, but come for the very first advice he could get. He was carefully examined, provided with no doubt a most excellent pair of spectacles, and sent home on his long journey rejoicing!

Nor is the life in the wards one dead level of pain and oppression. Games of draughts and dominoes help to enliven the day; some of the patients show waggish proclivities, and keep the others amused; and sometimes even a quarrel will add to the general entertainment. Such was the case when the "Teacher" one day allowed his sense of general superiority to carry him away, and he condescendingly addressed the negro as "Snowball!" The title was one so much resented by the good-natured darkie that, carried away by a gust of passion, he determined that, on his bended knees, the "Teacher" should take back the opprobrious epithet, or every doctor in the hospital should be summoned to adjudicate on the case. The result may be inferred from the fact that no doctor's presence was found necessary. On leaving the hospital the "Teacher" gave, from his own account, a most successful benefit instrumental and vocal concert, for which tickets were sold at half-a-crown apiece, some of which he gallantly presented to the Sisters and nurses.

One touching instance of devotion was told me. A foreign seaman arrived one day in the out-patients' room suffering from a severe affection of the eyes, which unless treated with the utmost promptitude threatened the total loss of sight. He was urged to remain then and there for treatment as an in-patient. His reluctance seemed impossible to overcome. At last he explained that he had with him in his lodgings two faithful companions, a monkey and a parrot. He could not leave them to die. Again it was urged that his eyesight depended on not losing any time, that delay would possibly cost him the loss of sight for life. He hesitated, but only for a moment. He could not leave them to die: he must go and make arrangements for them and return. No remonstrances were of any avail, and the chance of complete cure was irretrievably lost. What gave the case an added touch of pathos was that his sacrifice was in vain as far as poor Polly was concerned. She died, he learnt with deep distress, before he left the hospital. One can but hope the monkey was of an affectionate disposition, and welcomed him back with the devotion he merited.

In the children's ward a little girl of about six years old kept them all alive. She had been well nick-named "Chattermag," and her diffusive confidences were of the most enlivening nature. She was suffering from cataract, and gave me a ready account of the operation she had undergone. I found that her account of the operation, which had struck me as mythical, was correct in every particular, and it was true that at the most crucial moment of the operation she had addressed her doctor cheerfully as follows:—"I si (say) Mr. Doctor, aren't you a-cutting of that thing in my eye? I know you're a-cutting of it out, ain't you? and it don't hurt one bit, and I don't mind one bit—you tell me when it's out."

One little incident in which pathos and comedy were strangely blended occurred just as I was leaving the hospital. A poor old Irishwoman, whose eye had been removed, but who was going on very satisfactorily, lay moaning on her bed, a prey not only to bodily pain, but mental anxiety and alarm. She would die, the poor soul kept sighing, she would die, she knew she would, she would die that day, if—she did not have a priest and some brandy! Before I left I met the priest on his way to her bedside; the other form of consolation, I learnt, must be denied her.

No visit to the hospital would be complete without seeing the library and museum, and the laboratory, which, with its long low lighting and coloured phials, would have delighted the eyes of a Dutch painter. It is here that each new glimmer of insight is laboriously followed up, and the foundations of future ophthalmic discoveries are being slowly laid, for the relief and cure, one may hope, of many thousands now beyond the reach of human aid

Before I left the hospital I had been shown through one of the windows at the back a piece of waste land on which some building had just been knocked down—a waste of broken bricks and rubbish, and yet a very Naboth's vineyard to the hospital authorities, overcrowded and hampered in their work as they are by the inadequacy of the present building. I was told that a great effort was being made to secure this piece of land, as once lost in this crowded bit of the City all chance of enlargement on the old site was gone for ever. After what I had seen of the work within the walls, and heard of the inadequacy of the present buildings to the growing needs of the hospital,[1] it seemed impossible that help should not be forthcoming. The arguments in favour of helping such work seem unanswerable. That the oldest, and by far the largest and most renowned,

[1] The building stands in very great need not only of enlarging to meet the steadily increasing number of patients, but also of reconstruction to adapt it to the modern requirements of health and comfort. As many improvements in this respect as the structure of the buildings allowed have been made during the last twenty years, but with every year the need has increased. All dangerous and urgent cases are at once admitted, but many patients have to be sent back to distant homes earlier than is advisable to meet this need for room; and many cases, particularly those of weakly persons and children, have to be treated as out-patients who would have a better chance of recovery within the hospital. Contributions should be sent to Robert J. Newstead, Secretary, Royal London Ophthalmic Hospital, Blomfield Street, Moorfields, E.C.

eye hospital in London, which also stands in the proud position of being the first "special" hospital in the world, should be crippled for want of support should touch our national pride. The more so as it has trained, or had upon its staff, a large proportion of the most eminent oculists, and is resorted to by numerous medical visitors from foreign countries in search of the best English scientific ophthalmic work.

Another aspect of the subject must not be lost sight of, as it touches nearly the great social questions of the present time. Of the 2,196 in-patients (1,784 of whom were cases for operation), and the 25,261 out-patients in the course of last year, making in all a total of 27,457, the vast majority were members of the working class, dependent on their exertions not only for their own livelihood, but in many cases for the support of their families. One has but to ask how many of our poor, apart from the noble work done by this one hospital, would have been flung upon the rates. In connection with this one branch of the good work done yearly by the institution may be mentioned. In the year 1888 over 1,500 poor needlewomen, mechanics out of employment, and other very poor persons were supplied with spectacles free of cost to enable them to return to their work. To others who can afford it they are sold at a very low price.

As I left the hospital doors I looked back at it with a new and almost reverent feeling. The noisy surroundings, the dingy exterior, were the same as a few hours before, yet now, as I read the plain black letters running along the face of it, I felt the Moorfields Eye Hospital meant more than I had thought or dreamt of noble human work and endeavour, and nobler human endurance—yet more, with what noble yet silent eloquence it enforced the Divine law:

"Bear ye one another's burdens, and so fulfil the law of Christ."

MARIAN VON GLEHN.

## A NEGRO SLAVE SET FREE IN FRANCE IN 1738.

IN the history of the abolition of the slave-trade and the emancipation of slaves much is said of the celebrated decision of Lord Mansfield in 1771. From that time it was an admitted principle in English law that no man can be legally detained as a slave in this country. It was through the zealous and persistent efforts of Granville Sharp that this triumph of freedom was gained. Before this pioneer of the anti-slavery cause took up the defence of the negro it was common for West Indian planters to bring their slaves to England, and to keep them in slavery. The decision of 1771 ended all this, and the legal and historical triumph was echoed by the poet of freedom:

> Slaves cannot breathe in England; if their lungs
> Receive our air, that moment they are free;
> They touch our country, and their shackles fall.

A new impulse was given to the anti-slavery movement. "We have no slaves at home, then why abroad?" The society for the abolition of the slave-trade was formed in 1787. Granville Sharp was succeeded by Clarkson and Wilberforce as leaders, and in 1807 the Bill was passed which decreed that no slaves should be landed in the British Colonies after March 1st, 1808. It was a long struggle in after years before the emancipation of slaves in our colonies was achieved; but the noble work went on, till, after the terrible judgments of the American Civil War, it could be said that in every English speaking land slavery was abolished.

It has been the boast of England that she has led the way in this crusade of liberty. But it must be admitted that in some of the great steps of this progress of Christian philanthropy France has the honour of having taken the first place. Even in regard to that generous boast, "Slaves cannot breathe in England," the same voice of freedom was heard in a celebrated trial, now forgotten, but worthy of being recalled to memory. We find a record of it among the *causes célèbres* as long ago as 1738, and this is a summary of the case.

Jean Boucaux, a negro Creole, born in the island of Dominica, or St. Dominique, as it was then called,[1] was the property, as slave, of the Governor of Cape Français, who was also Lieutenant-Governor of the island under Louis XIV After the death of the Governor, his widow, Madame de Beaumanoir, in January, 1724, at Rochelle, married the Sieur de Verdelin, Chevalier of the Order of St. Louis, and a high military official. Two years afterwards M. and Madame Verdelin sailed for St. Dominque, to arrange as to the partition of the property with the children of the Governor by her first marriage.

On returning to France M. Verdelin brought with him two slaves, of whom Jean Boucaux was one. He took the precaution to have the written permission of the Governor of the Island, the document being registered at the Admiralty office at the Cape Française, and also at Rochelle, the place of his arrival in France.

Boucaux had been trained, by M. Verdelin's orders, to be an excellent cook, and he served in that capacity from 1728 to the 10th of June, 1738. On that day he caused the negro to be arrested in the kitchen, having reason to suspect that he intended to run away, and fearing to lose his services.

Boucaux was so far from thinking of flight that he had long considered himself free; in fact, since he first stepped on the soil of France. Feeling assured of this, and being attached to the family, he remained in their service. Now that his master became his enemy he remembered

[1] Dominica, now one of the British "Leeward Island" colonies, was a French possession till 1763.

that he had made no personal declaration on landing at Rochelle, as the law required him to do. He quietly accepted the position, and without anxiety saw himself carried off from his master's house. He was lodged as a prisoner in the Grand Châtelet. M. Verdelin even contrived to get him immured in a dungeon, but he did not long remain there, because the gaoler dare not retain him without the order of a magistrate.

Such was the state of affairs when, on the 17th June, 1738, the slave lodged a petition with the judges of the Admiralty Court of Rochelle. On the 20th of the same month a summons was sent to M. Verdelin to answer the statements of that petition, at the same time ordering Boucaux to remain under the safe keeping of the King and of justice (*sons la sauvegarde du Roi et de la Justice*), as the legal phrase ran. Consequently he remained in the Grand Châtelet, with instructions to the gaoler to keep him in prison till he received orders to the contrary.

The case had by this time attracted notice in the courts of law, and at the request of M. le Procureur du Roi, the judges issued a second order to the gaoler to bring Boucaux out of prison, who had meanwhile presented to the court two further petitions, one on the 29th of July and the other on the 21st of August. In the first of these petitions Boucaux, who seems to have either had shrewd mother wit or good advice, demanded that Sieur and Dame Verdelin should be sentenced to pay to him 4,200 livres, the amount of wages due for nine and a half years' service as cook, or such amount as the court might decree; that he might be removed from prison on bail; that the charges against him should be erased and cancelled; and that the recorder and gaoler should be charged to carry out the petition.

In the petition of the 21st of August the slave renewed his demand for wages, adding a claim against Sieur and Dame Verdelin for such damages as the court might judge right, on account of his false imprisonment and harsh treatment in prison.

The case was before long brought formally before the Court of Admiralty, which had jurisdiction in such matters. M. Mallet appeared as advocate for the slave, M. Tribard for Sieur and Dame Verdelin.

M. Mallet enlarged on the edict of 1685, which laid down the conditions and limits of slavery. At that time it is certain that there were no slaves in France, so that the motives and conditions of the edict of 1685 had no application except in the colonies beyond the sea, where alone the requirements of the edict were applicable. Negro slavery was recognised and permitted in these colonies only for the cultivation of the soil and for utility of commerce; and when these two motives do not exist the right of having slaves no longer continues, because the particular causes authorising the condition also cease.

It is true that another edict was decreed in 1716, but this only confirms the position laid down in 1685, and in no way interferes with the maxims and usages established in France in favour of freedom. His Majesty, by his edict of 1716, ordered that slaves brought from the colonies, either to be instructed in the Christian religion or to be taught some trade or craft to make them useful in the colonies, were not to be regarded as free; whence it follows as a necessary consequence that masters who bring slaves to France without observing the formalities prescribed by that edict give room for the slave to reclaim his freedom. Sieur Verdelin had not fulfilled the required conditions, and so had no standing under the edict of 1716; on the contrary, he had neglected or violated all the formalities ordained by that law.

M. Tribard, the advocate of Sieur Verdelin, rested his case on two points: first, that the recognition of the relation of master and slave in the edict of 1685 could only be annulled by the act of the master and proprietor, the arrival of Boucaux in France changing his domicile, but not his condition; secondly, that the intention and object of the edict of 1716 had been fully met by the permit of the Governor, and by the registering of this permission both at Cape Français and at Rochelle.

After the arguments were summed up by M. le Clerc du Billet, Procureur du Roi of the Admiralty, the court delivered the following sentence:

"We pronounce and declare that the client of M. Mallet is free in his person and goods from the time of his arriving in France; in consequence, we order that he be set at liberty and taken from prison, and the writ against him be erased and cancelled; that the recorder and gaoler see to the carrying out of this order. We order the clients of M. Tribard to carry out the order of the court in regard to the person and the goods of M. Mallet's client, and the case is adjourned for eight days in order to obtain an equitable adjustment, with the help of the Procureur du Roi, as to the amount of wages, damages, and other claims made by the petitioner."

The decision touches on other points; but the one important fact for which we recall the case is the decision that the freedom of the slave was assured by the edict of 1685 on touching the soil of France, except in circumstances for which special conditions were laid down by a subsequent edict.

This assertion of personal freedom was made even in the despotic time of Louis XIV. We need not therefore be surprised that at the Revolution of 1789 there was a declaration of "The Rights of Man" as to personal freedom; and this was renewed by the Republic of 1848, when a short Act was passed abolishing slavery throughout the French dominions. "*La République n'admit plus d' esclavee sur le territoire Français.*" This noble resolution was referred to in the memorable speech of the Prince of Wales at the jubilee meeting of the Anti-Slavery Society, in the Guildhall, on the 1st of August, 1884.

Now that the nations of Europe are concerting measures at the Brussels Conference for putting an end to the slave-trade in Africa, let us hope that France will remember its honourable deeds and traditions in this great cause of freedom and philanthropy, and support the efforts made to suppress the traffic in slaves, and to spread civilisation over the Dark Continent.

# Varieties.

### Robert Browning's Funeral.

No part of the great ceremonial in Westminster Abbey on the 31st of December was equal in impressive effect to the rendering of Mrs. Browning's exquisite verses, "He giveth His beloved sleep."

What would we give to our beloved?
The hero's heart to be unmoved,
The poet's star-tuned harp to sweep,
The patriot's voice to teach and rouse,
The monarch's crown to light the brows?—
"He giveth His beloved sleep."

O earth, so full of dreary noises!
O men, with wailing in your voices!
O delvëd gold, the wailers heap!
O strife, O curse, that o'er it fall!
God strikes a silence through you all,
And "giveth His beloved sleep.

His dews drop mutely on the hill,
His cloud above it saileth still,
Though on its slopes men sow and reap;
More softly than the dew is shed,
Or cloud is floated overhead,
"He giveth His beloved sleep.

As the last words of the sublime discourse of St. Paul on the Resurrection died away upon the the ear, at a preliminary chord upon the organ the vast audience by one impulse silently rose to their feet. Then in this solemn stillness there rang out the clear notes of a solitary chorister: *What would we give to our beloved?* The question was taken up by the chorus in a fine rendering of the descriptive lines beginning,

The hero's heart to be unmoved,
The poet's star-tuned harp to sweep,

at the close of which the choir, with marvellous sweetness of contrast, gave the words, "He giveth His beloved—sleep," the last word seeming to die away into the silence. Then there broke out the lament, "O earth, so full of dreary noises: O men, with wailing in your voices"—wonderfully rendered, so as to convey the idea of "storm and stress" without breaking in upon the calm solemnity of the leading theme; when, as with electric power, came in the phrase—

*God strikes a silence through you all,*
And "giveth His beloved—sleep."

Nothing more was needed than the brief and lovely description that follows: "His dews drop mutely on the hill"—and so to the end of the stanza, when the *refrain* of the anthem, rendered, if possible, more delicately and sweetly than ever, brought the "Meditation," as Dr. Bridge entitled the composition, to a close. It was by a happy inspiration that the pathetic and charming poem of the wife was thus made to combine a personal and affectionate interest with the stately obsequies of the husband. Many eyes became dim with sudden tears; and although, no doubt, the "Meditation" of Dr. Bridge will soon become familiar to all lovers of sacred music, it can never be repeated amid circumstances of such unique and touching solemnity.

A correspondent sends to "The Nonconformist" the following letter, written by Robert Browning in 1876 to a lady, who, believing herself to be dying, wrote to thank him for the help she had derived from his poems, mentioning particularly "Rabbi Ben Ezra" and "Abt Vogler," and giving expression to the deep satisfaction of her mind that one so highly gifted with genius should hold, as he held, to the great truths of our religion, and to a belief in the glorious unfolding and crowning of life in the world beyond the grave.

"19, Warwick-crescent, W., May 11, '76.

"Dear Friend,—It would ill become me to waste a word on my own feelings except inasmuch as they can be common to us both in such a situation as you describe yours to be—and which, by sympathy, I can make mine by the anticipation of a few years at most. It is a great thing—the greatest—that a human being should have passed the probation of life, and sum up its experience in a witness to the power and love of God. I dare congratulate you. All the help I can offer, in my poor degree, is the assurance that I see ever more reason to hold by the same hope—and that by no means in ignorance of what has been advanced to the contrary; and for your sake I would wish it to be true that I had so much of 'genius' as to permit the testimony of an especially privileged insight to come in aid of the ordinary argument. For I know I myself have been aware of the communication of something more subtle than a ratiocinative process, when the convictions of 'genius' have thrilled my soul to its depths, as when Napoleon, shutting up the New Testament, said of Christ—'Do you know that I am an understander of men? Well, He was no man!' ('Savez-vous que je me connais en hommes? Eh bien, celui-là ne fut pas un homme.') Or as when Charles Lamb, in a gay fancy with some friends as to how he and they would feel if the greatest of the dead were to appear suddenly in flesh and blood once more—on the final suggestion, 'And if Christ entered this room?' changed his manner at once, and stuttered out—as his manner was when moved, 'You see, if Shakespeare entered, we should all rise; if *He* appeared, we must kneel.' Or, not to multiply instances—as when Dante wrote what I will transcribe from my wife's Testament—wherein I recorded it fourteen years ago—'Thus I believe, thus I affirm, thus I am certain it is, that from this life I shall pass to another better, there, where that Lady lives, of whom my soul was enamoured.' Dear Friend, I may have wearied you in spite of your good will. God bless you, sustain, and receive you! Reciprocate this blessing with yours affectionately, ROBERT BROWNING."

### Comets Expected in 1890.

Since our note on the comets of 1889 was written two more telescopic bodies of that class have been discovered, the first on the 17th of November by Professor Lewis Swift, of the Warner Observatory at Rochester, in the State of New York, and the second by M. Borrelly at Marseilles on the 12th of December. One of the comets previously discovered by Professor Swift in 1880, had indeed been seen as early as 1869 by the late M. Tempel, then located at Marseilles, but afterwards Director of the Observatory at Florence, where he died; but the fact that it was moving in an elliptic orbit, with a period of only about five and a half years, was not recognised until after its re-discovery by Swift in 1880. It is a small body, and escaped observation in 1886, but another return will be due towards the end of next year (1891). But in the present year (1890) four known periodical comets (all faint bodies) are expected to return, and one of them is likely to become visible very shortly. It was discovered by Theodor Brorsen at Kiel on the 26th of February, 1846, and was seen again in 1857 and on later occasions. Its period of revolution round the sun is (like that of Swift's comet) only about five and a half years, but this short period was acquired in the last century, when the comet made a

near approach to Jupiter, the attraction of which quite altered its orbit, and a similar approach next century will probably dismiss it again into the remoter parts of space.

The late Professor D'Arrest, of Copenhagen, discovered a small comet at Leipzig in 1851, which was found to be moving in a short ellipse, with a period of about six and a half years. It was seen again (in the southern hemisphere) in the winter of 1857-8 and on two subsequent returns, though not at the last, which was calculated to take place in January, 1884. Another will be due in the course of next summer.

The orbits of the remaining comets expected this year are not quite so certain. One was discovered by M. Coggia at Marseilles in the month of November, 1873, and was afterwards calculated by Professor Weiss, of Vienna, to be moving in an elliptic orbit of about five and a half years' period, and to be probably identical with a comet discovered by that great comet-discoverer Pons so far back as 1818. It has not been seen at either of the two returns due since 1875, but another will be looked for before the end of this year.

More interesting was a comet which was discovered by Mr. Denning at Bristol on the 4th of October, 1881. It has been thought to be identical with one discovered by Blanpain at Marseilles on the 28th of November, 1819, and calculated to be moving in an elliptic orbit with a period of about five years. But when observed in 1881 the motion showed that the period amounted to nearly nine years, so that if the comets are identical this must have been considerably lengthened by the effects of planetary perturbation. Fresh light will be thrown upon this if Denning's comet returns, as expected, in the spring of this year.

It may be added that a small comet discovered by Mr. Barnard (then at Nashville, Tennessee, now at the Lick Observatory, California) on the 16th of July, 1884, has also been determined to be moving in an elliptic orbit, with a period of about five and a half years, so that it is due in the neighbourhood of the sun at the present time ; but, being very unfavourably placed for observation on this occasion, it is not likely that it will be seen until the next return, in the summer of 1895.

A very interesting circumstance has transpired from the investigation of Mr. S. C. Chandler, of Boston, U.S., with regard to one of the supposed new comets of last year, which was discovered by Mr. Brooks of Geneva, N.Y., on the 6th of July. It is that this comet is in fact identical with one discovered by Messier at Paris in 1770, and calculated by the Russian astronomer Lexell to be moving in an elliptic orbit with a period of about five and a half years. Not being seen afterwards, it was commonly called Lexell's lost comet, but it has long been known that this was in consequence of a close approach to Jupiter which greatly lengthened its orbit. Mr. Chandler now finds that another approach to Jupiter in 1886 shortened the orbit again to little more than seven years—that it was, in fact, the comet found by Mr. Brooks on the 6th of July, 1889, and may be expected to return in 1896.

W. T. LYNN, B.A., F.R.A.S.

### Puritans and English Liberty.

David Hume in his History says : "So absolute was the authority of the Crown that the precious spark of liberty had been kindled, and was preserved by the Puritans alone ; and it was to this sect the English owe the whole freedom of their Constitution."

Ranke the historian says : "We may consider Calvin as the founder of the Free States of America. It was his doctrines which shaped the men who left home and country in order to preserve their religious freedom in the wilds of America."

The American historian Bancroft, draws this conclusion from his studies : "He that will not honour the memory and respect the influence of John Calvin knows little of the origin of American Liberty."

The Republicans of Boston, U.S., have recalled these testimonies after hearing Sir Edwin Arnold, in a lecture at Harvard, extrolling Buddhism above New England Christianity. "As for the shade in the Hindoo system," said the author of the "Light of Asia," "I love the gloom better than the Calvinistic sunshine." No wonder that the better class of his audience felt this sentiment, as a reporter says, "an insult to their intelligence, a scoff at their best inheritance, and a slander upon their noblest ancestry. The Puritans planted the seed of this great Government. They reared the generation that maintained the struggle for Independence. They established the schools and universities which have delivered the land from ignorance and superstition."

---

### American Protest against Football.

A New York paper gives a decided opinion as to football matches as generally played. Referring to a recent match, it is said :

"Football was the only amusement that made bad blood and disgraceful conflicts when we were students. We read a defence of the behaviour of the Lafayette College students who have been accused by the 'Philadelphia Times' of great brutality in their recent contest with students from the University of Pennsylvania. But the defence is nothing more than a bitter retort that heaps the disgrace on the other institution. Neither college obtains anything but shame from the game, as its details are published throughout the land."

There are many who feel as strongly about football in England. Certain it is that both in Rugby and Association matches there are often rough and almost brutal scenes enacted, especially with betting and professional players, and fatal accidents are frequent. It is in vain to protest against the game because of abuses, but we regret the almost total extinction of the old game as it used to be played in Scotland in former times. To touch the ball with the hand, except after a fair catch, was dishonourable, and many a noble game was witnessed, between parish and parish or between county and county, on the old system. The present game is mainly an occasion of displaying muscular strength, and a dead cat might as well be the object of contention as the ball. A wide boundary was the goal in the old game, the boundary of the field or of the parish, to which the ball was brought home by agility and skill, and it was then literally a "football" to be kicked, not a lump to be lifted and handled and fought for.

A great football match was played on 5th December, 1815, between the men of Ettrick Forest and the men of Yarrow, the one party backed by the Earl of Home and the other by Sir Walter Scott, Sheriff of the Forest, who wrote a famous song for the occasion.

We forget each contention of civil dissension,
And hail as our brethren, Home, Douglas, and Car,
And Elliot and Pringle in pastime shall mingle,
As welcome in peace as their fathers in war.
Then up with the banner, etc.

Then strip lads, and to it, though sharp be the weather,
And if by mischance you should happen to fall,
There are worse things in life than a tumble on heather,
And life is itself but a game at football.

Then up with the banner, let forest winds fan her,
She has blazed over Ettrick eight ages and more ;
In sport we'll attend her, in battle defend her,
With heart and with hand, like our fathers before.

Thus has Sir Walter Scott celebrated the old Scottish-played game of football. The whole song is given in the "Leisure Hour" for 1883.

---

### The Total Eclipse of December 22.

It was stated that one great object proposed to be obtained by the projected observations of this eclipse was whether any changes could be remarked in the form of the solar corona during the interval which would elapse between the times of totality in the West Indies and on the west coast of Africa. News from the latter place arrived first. The English party, organised, like the other, by a committee of the Royal Astronomical Society (of which Mr. Turner, of the Royal Observatory, Greenwich, acted as secretary), was located at

Loanda, an island off the coast of Angola, and had to report that, owing to cloudy weather, no observations were possible during the time of totality. The above object therefore, so far as the recent eclipse was concerned, was a failure, though observations made whilst the eclipse was partial will be of value in improving the lunar tables. Some of these were obtained by an American party, the chief of which, Mr. D. P. Todd, looks upon the results as "not disappointing." More recently intelligence has been received from the party sent to the West Indies under the charge of Father Perry, of Stonyhurst College, who had had much experience in the observation of total solar eclipses, besides having had the conduct of the expedition sent to Kerguelen in 1874 to observe the transit of Venus there. The recent eclipse party under his direction proceeded to a small group of islands off the coast of French Guiana, called the Salut Islands, where they were completely successful, and the observations and photographs now known to have been obtained, although the South African failure will prevent their aiding in the solution of one question, will doubtless prove of great value in that of others, particularly of the extent of the solar corona and its varying light and changes of constitution at different distances from the sun. But the news, which was cabled from Demerara, was accompanied by the distressing intelligence of the death of Father Perry, of dysentery, on the 27th of December, five days after the eclipse. He was in the fifty-seventh year of his age, had been a professor at Stonyhurst College since 1860, and was elected president of the Liverpool Astronomical Society last year.

---

**Errors of the Reporters.**—Baron Dowse, in giving judgment in a case of alleged libel, which turned mainly on the omission of the word *not*, said "mistakes often occurred in newspapers. An instance arose in reference to himself. Addressing a Cork jury he quoted that well-known line from Tennyson's 'Locksley Hall':—

'Better fifty years of Europe than a cycle of Cathay.

What was his horror when he found himself reported in a local paper as having said:—

'Better fifty years of Europe than a circus in Bombay.

And yet he did not bring an action for libel imputing that he was a sort of judicial Barnum."

**Thirty-shilling Pieces of Gold.**—Dr. John Evans, F.R.S., President of the Numismatic Society, advocates the coining of thirty-shilling gold pieces, which would be both convenient and thrifty, as the waste of half-sovereigns in currency is so large.

**Suez Canal Traffic.**—In the year 1886 the percentage of vessels passing through the Canal under the British flag was 75·19 per cent. of the whole number, and the tonnage 76·92 per cent.; the numbers in 1888 were 76·31 per cent. and 78·65 per cent. respectively.

**The Alexandria Library.**—A Vienna journal says that the story of the burning of the Alexandria library by the Mohammedan conqueror is a myth, and not a historical fact. The statement thus appears:—"The investigation of the famous Fayum collection of Egyptian manuscripts, bought by Archduke Rainer, and deposited in the Imperial Library at Vienna, has been progressing for some two or three years. The work has been rich in important results, including the discovery, by incontrovertible evidence, that the story of the destruction of the Alexandrian library is a fable."

**Flinders' Voyage.**—At a recent meeting of the Royal Colonial Institute it was announced by the Marquis of Lorne that the Council had acquired the original pencil and water-colour drawings by William Westall, A.R.A., landscape painter to the celebrated expedition of discovery and survey on the coast of Australia, commanded by Captain Matthew Flinders, of his Majesty's ship Investigator, in the years 1801, 1802, and 1803. The sketches comprise views of King George's Sound, Port Lincoln, the head of Spencer's Gulf, Kangaroo Island, Port Philip, Port Jackson, the Hawkesbury River, Keppel Bay, Port Bowen, Shoal Water Sound, Thirsty Sound, and the Gulf of Carpentaria, besides sketches illustrative of the natives, the flora and the fauna. The collection is one of the greatest historic interest, forming the entire existing series of the sketches made by the artist during the expedition. A fine series of charts was also prepared. In connection with these engravings it may be mentioned that after the celebrated voyage of the Adventure and Beagle (1826-1836) Captain King expressed to the artist his personal obligations for the great accuracy of his work. It appears that on the first approach to Australia of these vessels during a heavy gale there was some doubt as to whether they could venture to make King George's Sound, but as they neared the coast the entrance was so readily recognised by aid of the illustrations that both ships were enabled to sail in without hesitation instead of beating about at sea.

**Salt and Fresh Water not Readily Mixed.**—When fresh water is introduced into a salt water aquarium it will remain on the surface, unless the whole is thoroughly stirred or mixed. The fresh water of rivers is not thoroughly mixed with the salt water of bays, but flows off on the surface, and only at considerable distance or after long time is the salt water predominant. Hence it is quite credible that the salt water of the South Atlantic off the mouth of the great Amazon river is fresh and fit for drinking above a hundred leagues from land.

**Shrewd Remark of Lord Melbourne.**—The young Queen Victoria expressed a little impatience at the delays in arranging certain household offices on the formation of a new Ministry. Her wise counsellor thus wrote to her: "Lord Melbourne trusts that your Majesty will not feel either surprised or discouraged at the difficulties which occur in making the arrangements, and which Lord Melbourne's experience enables him to assure your Majesty always do occur in transactions of this nature. The persons who are the best fitted for offices are often the most unwilling to undertake them, and those who are least qualified most eager to obtain them."

**John Wanamaker's Store.**—Mr. Wanamaker is the present United States Postmaster-General. His store, covering a block of about four acres in Philadelphia, is an aggregation of every kind of shop, and a favourite rendezvous of the ladies. Mr. Wanamaker is the superintendent of the largest Sunday school in the city, and owner of Munkacsy's popular pictures, "Christ before Pilate," and "Christ on Calvary," both of which he lent to the Paris Exhibition, and for the former of which he gave £24,000. He is a director of the Reading R. R. Co., and runs two or three other large business establishments in the town besides. Like many other energetic business Americans, he began with almost nothing, and has amassed a large fortune, though still comparatively a young man.

**General Sir Ralph Abercromby.**—This gallant soldier, after much distinguished service, fell at Aboukir whilst leading the expedition which landed in Egypt in 1801. He was a man of devout spirit and exemplary life, and was a "Ruling Elder" in the Kirk of Scotland. When he was ordained by the Presbytery, he thus addressed the court: "I have been often entrusted by my Sovereign with honourable and important commands in my profession as a soldier, and his Majesty has been pleased to reward my services with distinguished marks of his royal approbation; but to be the humble instrument, in the office of an Elder, of putting the token of my Saviour's dying love into the hands of the meanest of His followers, I conceive to be the highest honour that I can receive on this side of heaven."

**Russia in the East.**—Fifteen years ago General Kauffman, the Commander-in-Chief of the Russian armies in Asia, thus stated his views as to the destiny of Russia in the East: "What has occurred with Khokand will certainly occur sooner or later with Bokhara, and other Mussulman States, which will not understand that they should accept the position, and allow with a good grace the introduction of civilisation among them. It is the old struggle between barbarism and civilisation. The issue is certain. Civilisation will triumph, and when the two great European Powers

which divide between them these immense territories shall have a common frontier, then there will be an end of conquests, there will be no longer any occasion of wars, and interests will be mutual, because they will be based on commerce and industry."

This opinion of General Kauffman was surely prompted by a worthier spirit than that which cherishes suspicion about Russian conquests in Asia.

**Captain Pollard, R.N.**—In the obituary of last year was included the name of Miss Pollard, of Plymouth, the authoress of many popular and high-toned story books, chiefly for the young, some of which first appeared in the "Girl's Own Paper." Her father, Captain Pollard, R.N., was midshipman and assistant signal master on board Nelson's ship the Victory, at Trafalgar, and was one of the few who stepped down from the poop without a wound at the close of the engagement. Another valued writer for the periodicals of the Tract Society, the late Mrs. Prosser, had also a hereditary association with naval history, her grandfather having been the Dibdin whose songs did so much to keep up the loyal and patriotic spirit of English seamen during the great war.

**Honiton Lace in 1802.**—Among the recollections of Mrs. Cartwright, daughter of the venerable Dean Garnier of Winchester, who died in 1873 at the age of 98, is the following about Honiton lace. It was when Napoleon was yet only First Consul. "One day I was walking in Paris about that time with Lady Mount-Edgcumbe and her two little girls (one of whom was afterwards Lady Brownlow), and we went into a lace shop. Lady Mount-Edgcumbe asked for some lace; she had a veil on. The shopman looked at her very fixedly for some moments without making any answer, and then said, 'Madame, what lace do you want? There is no lace we would not give you in exchange for that veil.' The veil was made in Honiton for twenty guineas at the time when Honiton lace was first known."

**Trouble and Sympathy.**—Sir Walter Scott makes Jeanie Deans, in the "Heart of Mid-Lothian," say, "It is na when we sleep soft and make merrily oursels, that we think on other people's sufferings. But when the hour o' trouble comes to the mind or to the body, and when the hour o' death comes to high or low, then it is na what we hae dune for oursels, but what we hae dune for others, that we think on maist pleasantly."

**Plumbers' Certificates.**—The Plumbers Company of the City of London having opened a registry for certified qualifications of workmen after examination, the men of this craft have largely responded, and many names are now on the list. It is the only instance on a large scale in which the masters and the operatives in any trade have combined to advance technical education among their members, the only instance of a large body of trade unionists giving their support to a system of registration based upon tests of qualification, and the only instance of the members of an important craft seeking the co-operation of the public authorities in rendering their craftsmen more serviceable to the public.

**Hittite Language.**—Major Conder announces that Professor Winckler, of Berlin, and Professor Sayce, of Oxford, have deciphered one of the curious inscriptions recently discovered at Tel-el-Amarna in Upper Egypt. The stone, which is marked with Cuneiform characters, akin to the Akkadian tongue, is a letter from a Hittite Prince to King Amenophis III, who ruled in Egypt long before the Exodus. The Prince sends to ask for the daughter of Amenophis as a bride for his brother's son, and enumerates the presents of gold, tin, ivory, &c., which accompanied his letter.

**Weather Forecasts.**—The meteorological forecasts published daily in the papers may be sometimes useful when the atmospheric conditions are so strongly marked as to justify the telegraphing of storm-signals for fisherfolk on the coasts. But for ordinary use little is told by these official forecasts. For instance, the weather is predicted in one sentence for "LONDON AND THE CHANNEL!" We all know how often it is beautiful weather at Brighton or Eastbourne while t is wretched in London. In the metropolis itself there may be "all sorts of weather" within a few hours. Here is a paragraph from an evening paper not long ago. It was on the day of the South London Gaswork strike, December 13th, 1889: "Some very peculiar atmospheric conditions prevailed in London and the suburbs last night. In the north of London, in the direction of the Swiss Cottage, the evening was bright, and accompanied by a keen frost. Here and there the copings and exposed portions of the walls and railings were white with hoar frost, and on the pavements the frost crystals glittered in the lamplight. At Piccadilly the atmosphere was warm and slightly damp, with no signs of frost. But a startling change had taken place towards Fulham in the south-west district. After leaving Hyde Park Corner a heavy fog hung over the streets, and it was with the utmost difficulty that vehicular traffic could be conducted. In fact, it was so thick that pedestrians were glad to avail themselves of the services of a number of lads and small boys who, armed with lanterns, showed the way in consideration of a few coppers. In South London generally a very heavy fog was experienced, and caused serious delay to railway communication. Soon after nightfall the foggers were out, and traffic was also impeded on the river, fog-horns and detonators being heard in all directions. This morning the fog had cleared away."

**Alfred Tennyson in 1836.**—In the "Life of Mary Howitt" we read that in 1836 the Howitts removed to the neighbourhood of London, where their circle of literary acquaintances increased; amongst others "The retiring and meditative young poet Alfred Tennyson visited us, and charmed our seclusion by the recitation of his exquisite poetry. He spent a Sunday night at our house, when we sat talking together until three in the morning. All the next day he remained with us in constant converse. We seemed to have known him for years. So in fact we had, for his poetry was himself. He hailed all attempts at heralding a grand, more liberal state of public opinion, and consequently sweeter, more noble modes of living. He wished that we Englanders could dress up our affections in a little more poetical costume; real warmth of heart would lose nothing, rather gain by it; as it was, our manners were as cold as the walls of our churches."

**"Advance, Australia!"**—The federal motto of the Australasian colonies is being well carried out. In a paper read by Mr. McFie at the Colonist Institute in December, it was stated that in 1851 the white population was about 240,000, with an annual trade of £6,000,000; whilst at the close of 1888 the population had reached 3,678,046, and the revenue £27,240,565. The public works in the whole colonies were valued at £175,000,000, private wealth at £1,015,000,000, and banks at £148,209,738. This was exclusive of the value of land not yet alienated. These figures are of a reassuring character as to the safety of the £170,000,000 which has been borrowed by the colonies.

**Marlborough Pamphlet Cases.**—A convenient case for the preservation of pamphlets and other unbound publications has been patented under the above title. It is made of different sizes, to suit the various sorts of printed matter, for Parliamentary Blue-books, music, the "Graphic," the "London News," the "Sunday at Home," and the "Leisure Hour," as well as smaller pamphlets.

**Century of Religious Statistics.**—In 1786 there were in Europe 37,000,000 Protestants, 40,000,000 of the Greek Church, and 80,000,000 Roman Catholics. In 1886 there were 85,000,000 Protestants, 83,000,000 of the Greek Church, and 154,000,000 Roman Catholics. So that while the Catholics increased by less than twice their former number, and the Greeks a little more than twice, the Protestants increased nearly two and a half times.

**French Journey Across Africa.**—A French traveller, Captain Trivier, crossed Equatorial Africa from the Atlantic to the Indian Ocean, and got to Mozambique on the day on which Stanley reached Bagamoyo. This achievement was communicated to the Geographical Society, which telegraphed congratulations to the explorer, who only took ten months to accomplish his feat. He sailed from Bordeaux for Loango, in the Atlantic, in August, 1888, and

started from the latter place at the beginning of last year. His design was (says the "Daily News" correspondent at Paris) to catch up Mr. Stanley, and he thought he might perhaps fall in with Emin Pasha. The "Gironde," the paper of M. Lavertujon, the Deputy, paid the expenses of his venturesome journey. Captain Trivier's route lay by Stanley Falls into the interior, and on by the great lakes to Tanganyika and Mozambique. No news was heard of him after he left Kasongo, on the Upper Congo, until the following telegram was received: "Arrived 6th December at Mozambique. Emile disappeared at end of September.—TRIVIER." Emile Weissenbourg was Captain Trivier's servant.

**Innovations in Scottish Churches.**—The Memoir by his friend and fellow-minister of the United Presbyterian Church has made the name of "Robertson of Irvine" as familiar in Scotland as that of "Robertson of Brighton" in England. The book presents a charming sketch of a remarkable man, whose high character covered faults that would once have brought upon him ecclesiastic censure. He was successful in getting what was for Scotland in those days a magnificent new church, built for himself and his ever-increasing congregation, and was among the first to introduce organs into Presbyterian worship. An old lady once remonstrated with him, saying: "I hear you are introducing some dreadful innovations into your church service." "Indeed!" he replied. "What innovations have we introduced?" "Oh!" she said, "I hear that you read the Commandments at the Communion." "Is that all you have heard?" was his reply. "We have introduced a far greater innovation than that." "What is it?" said the good old lady, in some alarm. "We try to keep them," was the reply.

**Waste Metal Cases.**—In an article on old metal in the "Plumbers' Gazette" it is said: "Tinned-meat cases are mostly treated very disrespectfully, only finding their way to the dustbin. However, of late the Surreyside empty dealer has found it worth while to put them in the melting cauldron and skim off the valuable solder that always rises to the top. The solder, you are told, runs away like water, the iron keeping at the bottom of the pot, a market for the solder being found among the poorer class of plumbers. As to tea-chest lead, after the case is sold it is often melted with solder into ingots and used for printers' type. Tobacco lead-foil also is purchased and melted down, claret capsules especially melting down into excellent lead." In an article in the "Leisure Hour" for 1888, p. 134, a curious account is given of the commercial uses of old tinned-meat cases and other waste metal under the heading, "What can be done with old Sardine Boxes."

**Tasmanian Potatoes.**—The Agent-General for Tasmania in London has sent to his Government a report dealing with the question of developing a trade in potatoes between England and Tasmania. Whilst, he says, there is no prospect of Tasmania opening up a profitable trade with this country in mature potatoes dug during the ordinary harvest season, as any deficiency in the English crop of mature potatoes can always be supplied by Germany, it is possible that new potatoes sent to England early in the season may realise very satisfactory results. The prices of such potatoes in the London market range from as much as £36 per ton in February to £12 per ton in April; and the Agent-General advises consignments to be sent.

**City Choristers.**—Alderman Sir Hugh Brice left a tenement, known as the "Cardinal's Hatte," to the rector and churchwardens of St. Mary Woolnoth, to provide, *inter alia*, "a clerk, expert in the playing at organs, cunning in the craft and science of singing and teaching of children." The clerk was, moreover, to keep a school and instruct such children as he could get, or as should be sent to him "to sing their plaine song and pryked song," as well as to attend mass regularly.

**City of London School and Oxford High School.**—The appointment of Mr. Pollard to the head mastership of the City of London School has done much to lessen the anxiety caused by the retirement of Dr. Abbott. From Manchester Mr. Pollard comes with high reputation as an able and energetic master. Before he went to Manchester he was the head master of the Oxford High School from the opening of that institution. The Oxford High School was founded chiefly through the exertions of the late Professor Green, an enthusiast in middle-class education, and desirous of establishing what he thought a model school of the class. It maintains its high character under the head mastership of Mr. Cave, of Magdalen College. At the last distribution of prizes by the Bishop of Oxford, Dr. Stubbs bore testimony to the efficiency of the school, the buildings of which were inaugurated by the late Duke of Albany. Among the successes of pupils announced on this occasion was an open classical exhibition at Merton by W. H. Gee, and the first exhibition in history at Balliol by W. G. Murray, a son of Dr. Murray, of the "Dictionary." Many other honours were gained by the pupils. The advancement of Mr. Pollard was referred to with just pride.

**Chinese Population.**—The number of souls is supposed to be now not much under 400,000,000. In the beginning of the 18th century it was probably not above 60,000,000. The increase has been rapid and continuous, in spite of civil wars, rebellions, famines, floods, and other calamities, and in spite of a vast outflow of emigrants to other lands. In fact, the emigration helps the prosperity of the empire, for the rich soil supports larger families, and Chinese emigrants all strive to return with wealth to their native land, and so contribute to the prosperity of the nation.

**Fading Ink.**—A French stationer declares that he has invented an ink warranted to fade off paper in a week without leaving the slightest trace. What a boon that will be to all sorts and conditions of men! Not only will politicians have fits but lovers will be able to give full vent to their feelings without the dread of breach of promises before their eyes, and the lawyer's clerk who always ends his epistles to his sweetheart "without prejudice," can allow a free rein to his fancy, knowing well that in ten days all will vanish and the paper regain its original value. Orders (under cover) will pour into this fortunate stationer.—*The Stationery Journal.*

**Filtered Water.**—An American physician has called attention to the danger of using ordinary water filters, if not frequently and effectually cleansed. He found that filters after being some time used caused great increase in the number of organisms producing disease, especially if the filter is kept in a warm place. It is a useful caution.

**American Meat Produce.**—The value of the meat product of the United States is now 150,000,000 sterling, of which £13,000,000 worth is annually exported.

**Surrey in 1801 and in 1881.**—In 1801 the population of Surrey was 268,233 persons; in 1881 it had risen to 1,435,842. A penny county rate in 1801 yielded £1,500; in 1881 above £39,000.

**Howard Centenary Memorial.**—In 1890 the centenary commemoration of John Howard is to take the form of a statue, at the cost of £3,000, towards which the Duke of Bedford has subscribed £300, Mr. Whitbread £300, Earl Cowper £100, Mr. T. Barnard and Mr. F. Howard each £100, and many other lesser sums. The Bedford people wish a statue of their own, as they have of Bunyan, otherwise the nation may well be satisfied with the famous statue in St. Paul's, the first erected there, of which the celebrated John Bacon, R.A., was the sculptor. If a large amount is raised by the centenary committee, a less costly statue might be supplemented by some other useful memorial of the philanthropist. The best brief record of his life is that by Dr. Stoughton in the cheap series of biographical tracts of the Religious Tract Society.

**Export Trade of France.**—Statistics recently prepared show that there was a decline in the value of French exports during the past twelve years amounting to no less than £7,500,000. The woollen exports, which in 1882 were valued at £16,000,000, fell to £15,000,000 in 1886, and scarcely exceeded £12,900,000 in 1888. Silks declined from £10,360,000 in 1887 to £8,920,000 in 1888; and linens,

which had an export value of £1,240,000 in 1877, scarcely yielded £320,000 in 1888. There was also a considerable decrease last year in the exports of turnery, leatherware, refined sugar, articles of fashion, and gold and silver ware. Taking the countries to which exports were sent, there was no material change as regards Portugal, Austria, China, and British America, while the exports to Belgium, the United States, New Grenada, Spain, the Argentine Republic, and a few minor States exhibited a total improvement of £9,160,000 during the past twelve years. But this gain was more than counterbalanced by a decrease of upwards of £18,000,000 in the value of the exports to all other countries. The exports to Great Britain fell from £42,000,000 in 1877 to £34,500,000 in 1888; those to Germany decreased in the same interval from £15,000,000 to £12,000,000; and those to Italy went down from £7,400,000 to £4,760,000.

**Thanksgiving Day in America.**—The story of the first Thanksgiving Day in New England is on this wise. Other days may have been privately observed, but it was in 1631, on Feb. 22nd, afterwards the birthday of George Washington, that the first regularly appointed Thanksgiving was held. The amount of food in the colony had grown very scanty, and the only hope of the colonists lay in the ship Lion, which had been sent back to England for supplies. More than six months had passed, and the vessel did not return. Governor Winthrop had no meal, and the other inhabitants of Boston were worse off. It is said that the public stores had been so reduced that a fast had been appointed to pray for relief, and that the Governor was in the act of giving the last handful of meal from his barrel to a poor man in distress, when a ship was spied entering the harbour with provisions enough for all. It was the Lion. The fast was turned into a thanksgiving, and the day, though at a different season, grew into a local observance, and is now a national holiday.—*New York Observer.*

**A Shakespearian Acrostic.**

*Answer*—PORTIA.

Prospero, Orlando, Rosalind, Timon, Isabella, Ariel.

# Household Queries.

**Corns, Nervousness, etc.**—*What is the best cure for corns? What is the safest drink for nervous constitutions? When a person's mind is bothered concerning disappointments occurring in every-day domestic life, what would be the wisest thing he or she could do to calm the mind?*—These queries trench upon that personal advice which we disclaimed giving last month, but we answer them because they are sent so far as from the Straits Settlements, where the writer could not as yet have become aware of the limitations described. There is no permanent cure for corns—do what you will they will come again—until the boots are altered which produce them. Get a pair of lasts made to fit you of your own, and if, as may happen, the sensitive skin is still hurt for awhile by what is not really tight, let a pad of leather be tacked on to the last at the tender place, so that the boot may be lifted there a little extra. If the corns are hard outside ones, apply Martindale's Solvine with a glass rod two or three days, and then pare carefully away with curved nail scissors. If the chemist has not got that, bathe in hot water and then pare as well as you can. Soft inside corns can sometimes be gradually removed with even the finger-nail and a little help from the scissors: if not, apply liquor arsenicalis morning and evening, which will enable you either to remove them easily, or may dry them up spontaneously. Of course it is poison—remember that. Nervous people should avoid all strong tea, only take coffee in the mornings, with two or three times its bulk of milk, and only use alcohol medicinally. Most other drinks will be wholesome, and in hot climates a little potash bicarbonate may often relieve acidity, or a little lemon or nitric acid a sluggish liver; but ask your local doctor, if one is near. For the last question, morally you must try to realise and follow the teaching of the Master, Who had to encounter more worry and contradiction than anyone else has ever had; but when the physical frame itself is felt from weakness and ill-health to be in a state of nervous excitement, benefit is sometimes derived from a small dose of bromide, combined with a small and not aperient dose of what is called "cooling" medicine, taken an hour or two before bedtime. But these things should not be made habits; and we give no doses, because they should be directed for your own case by a medical man.

**In a Dark Room.**—*Which of two mantelpieces would be the most suitable and serviceable for a parlour having a high wall opposite, which somewhat darkens the room; a dark enamelled slate, imitating various shades, such as red, green, and grey marble, or a real white marble one? Also, which of the two would look the best with an oak or walnut overmantel?*—The white marble would reflect a little more light, but not much, and in other respects would look rather glaring and incongruous. It will be better as regards general effect to have the darker colour, or even a wooden mantelpiece, which appears far more cosy and homelike, and to get what light you can from the glass in a specially chosen overmantel, and perhaps some other glass about the room. A little in corner brackets, by the cross-lights so given, often has considerable effect.

**Washing Flannel.**—*What is the best way of washing flannel shirts to prevent them shrinking? I have sent them to a laundry, also had them washed at home, but find they always decrease in size until most uncomfortable to wear.*—It is very difficult to avoid some shrinkage. First of all the flannel must be properly shrunk before making up, and this can only be done by soaking it in a tub in plenty of boiling water, leaving it in till cold, and then hanging to dry in the open air. In washing afterwards the chief thing is that the clothes must be quickly washed and quickly dried. They must never be rubbed or wrung with the hands, which shrinks and thickens them; nor should very hot water be used. The usual way is to wash one at a time by drawing through the hands in warm, but not hot suds; they are not to be soaped, but a wringing machine is useful. They are rinsed in lukewarm water, in which some soap is dissolved, turned inside out in the rinse, shaken, stretched, and hung out to dry quickly. It spoils them to leave them in the wet, or to put them very near the fire in drying, or to boil them, or keep them long in boiling water, or to wring in the hands. The rinse in soapy water, quick washing in not too hot water, quick drying, are the chief things, and a judicious stretching while wet will do something.

**Versification.**—*Will you please give the name of a good book on English versification (metre, rhythm, etc.)? Verse-making may be made a quite harmless form of amusement?*—Certainly it may; and perhaps you may some day proudly blossom forth as "the inventor and proprietor of this pome." There is "Guest's History of English Rhythms," (Bell and Sons), and—to be frank—we do not know whether there is any other, as regards metres. Amongst its other merits, much of Tennyson's best work is worthy of attentive study for its marvellous accuracy and finish in this respect; and many lines are truly wonderful examples of difficulties overcome in apparently the simplest manner. But it is allowable now to use or invent *any* metre, so long as consistency is preserved. In finding rhymes "The Rhyming Dictionary" will be a great assistance.

THE ORDER OF RELEASE. 1746.

# SENIOR AND JUNIOR:

## A COUNTRY TOWN CHRONICLE.

BY LESLIE KEITH, AUTHOR OF "GREAT GRANDMAMMA SEVERN," "THE CHILCOTES," ETC.

### CHAPTER XVI.—LAVY SPEAKS HER MIND.

ANDREW KNEW THAT HE WAS IN FOR A SCENE, AND DID NOT LIKE IT.

BUSINESS rather than pleasure strictly so called took Andrew Hallett about this time to Hallett Place; yet it was surely pleasure of a very measurable sort to be out in the lanes astride of a good horse, with a fair summer world as a background for young desires and fancies.

Andrew was in very good spirits. He had the delight in riding that bold horsemanship and an excellent mount made legitimate. It was all very well for Mr. Hallett, senior, to amble about the lanes on his sedate cob, to jog up and down beside the covert on hunting mornings while the hounds were drawing, or hang about the crest of the hill watching the sport from a distance; but Andrew was at an age when a dashing flight across country has an exhilarating effect on young veins. Even when he was alone and bent on business, as he was to-day, his energy and young activity demanded a quick pace in spite of the summer sun that smote a little fervently on the flat Eastshire uplands.

He was glad for many reasons to be out in the

summer world rather than shut up within the office walls, where he shared a room with his father. Of late this companionship had been trying even to a young man who possessed an undoubted command over his emotions.

Mr. Hallett's temper, which was naturally of the explosive order, had within the last weeks lapsed into a chronic growl, almost as difficult to bear with patience as a bruise that never allows you to forget its presence. Nothing that the son did or said could find favour in the father's eyes; the clerks in the outer room trembled as they bent over their desks; upstairs the women sat together and were silent, conscious that something was wrong to make papa look so glum, and anxiously afraid lest any look or word of theirs should add fuel to the fire of his displeasure.

Andrew was not taken into the senior's confidence, but he was shrewd enough to guess pretty accurately what turn matters were taking. When he threw up the window of his bedroom in the morning he would look across the way and shrug his shoulders with a very knowing air.

The bank-house wore its accustomed aspect of prosperity and good cheer: the butcher's boy left handsome joints at the side-door, Mosses and Drinkwaters trooped up and down the steps, farmers dropped in to dinner on market days, a county squire now and then was glad to break his fast in the big dining-room when he rode into Melchisford to do business at the bank, the neighbours came as they had done these many years for a chat and a bit of supper in the long summer evenings—but, for all that, black Care had crept in like a thief, and become a tenant for life in that once happy home.

Andrew, junior, had been told nothing, but he knew very well, for all that. He could see his uncle's jolly face was lined and careworn, and when uncle and nephew met in the streets the older man would brush past the younger without a word. Andrew, for his part, went by with an uplifted chin. He had always despised his Uncle Mellish for a weak, good-natured fool, who served others to his own loss, and he cared little to forego his friendship, but he did not relish the effect of this estrangement on the home atmosphere. It was as if an east wind had penetrated there to temper the summer sunshine; his mother's comely face was sad and anxious, as if she were always listening for the approach of calamity, her tired eyes spoke of wakeful nights, she no longer slept peacefully in her chair after dinner, lulled by Hester's gentle music—indeed, that music was stilled of late, for the master shut himself up in his little dismal den at the other extreme of the house, and would not be lured by Hetty's artless wiles.

She set the door open as if by accident and played his favourite pieces, but all in vain: he made no sign until the hour for prayers, when he appeared with a dark brow, and read in a voice that made even the servants tremble.

From garret to cellar everyone felt the blight of the master's changed looks, and even Mary Kelynge, who was not quick at conclusions, began to wonder whether hers was the offending presence that had imposed this silence where once there had been bland and gracious words.

It was natural enough, seeing what comfortable proportions that brotherly and sisterly relation Andrew had so successfully fostered had now assumed, that she should take her tremors to him.

"Do you think, Mr. Andrew," she began, on one of those many occasions when chance or design found them alone together.

"'Mr. Andrew!'" said the young man, reproachfully; "surely we may drop that formality now!"

Mary blushed one of those deep dull blushes that were with her a signal-flag of distress.

"You've adopted me, you know, as—as a brother," he went on, with a smile; "and you have given me the privilege of calling you Mary."

"That's different," she said, quickly, though she would have been totally incapable of explaining the subtleties of her feeling.

Andrew did not press the point. Her hesitation did not displease him; it was even soothing to his vanity. If she were a little in awe of him, why not? It is the woman's part to be in subjection.

"What was it you wanted to ask me?" he said.

"Do you think," began Mary, gathering courage again—"do you think your father is displeased because I am staying here?"

"The governor?" said Andrew, looking very much surprised; "what could make you imagine that?"

"Perhaps he thinks I am staying too long," she faltered.

"He couldn't think that," said Andrew, quite gravely. "He thinks it a great honour that you should have chosen to make this your home—we all think it an honour. It will be a melancholy day for us if—when the day comes that you must leave us."

"It will be a sad day for me," said Mary, the ready tears beginning to rise.

"Don't you think it will be sad for somebody else, too?" said Andrew, taking her hand—perhaps to comfort her. "You mustn't mind my father; all his grumpiness means business—business that has not gone quite straight. It has nothing to do with the house or anyone in it; though to look at my mother you would think we were all in disgrace. All men who have business cares are like that at times."

"Not you," said Mary, with the most innocent flattery.

Andrew laughed. "Oh, I can cut up pretty crusty, too," he said; "but I don't take such a grip of things as the governor. It's no good; whether we worry or not, it all comes to the same thing in the end."

Mary looked at him as if she thought this a very noble sentiment. Her eyes said, "How brave you are!" and when a woman's eyes use that language it is not very difficult to read their meaning.

When Mary wore that look she almost ceased to be plain; she forgot herself, her fears, her hesitations, her blushes as she looked up into the bold, handsome, well-pleased face above her; but

though she was no longer afraid, Andrew had not yet fulfilled his task of comforter. He was very eager that she should not be frightened; she must promise not to mind his father's frowns or his short words and preoccupied looks. He was so urgent about this that she straightway repossessed herself of all her conquered alarms, and so had to be comforted over again.

"I'll take care of you; don't you bother," he said; "you've given me that right, you know. My mother is good to you?"

"She is goodness itself—and so is Hetty."

"Well, you mustn't mind the old man; his bark is worse than his bite. If it weren't for that I'd have been demolished long ago."

It was in this way that Andrew practised the rôle of brother to a new-found sister. If anyone had told him he was basely playing with a woman's heart under this guise of brotherhood he would hotly have repudiated the assertion. What had hearts to do with it? he would have asked—and, indeed, his own remained quite comfortably in his control; it was only this poor silly girl's that was going out to him day by day a little more—shyly at first, then confidingly, then irretrievably. Brother and sister? It was a cruel partnership on which he had set his fancy—a partnership which he was to be free to break or to maintain as it pleased and served him, while the other side was to be wholly bound.

Andrew, junior, was certainly a wiser man than his father when he resolved to have nothing to do with any feelings which made him uncomfortable. It was a most serviceable sentiment—a thousandfold better than love, at which he had now and then played. Love is too clamorous, too urgent in its demands; friendship asks so little that you may deny its claims at any moment without a scandal or a scene.

"Or you may wear it for a lifetime," he said to himself, "and never let it gall or fret you." He laughed aloud as now he spurred on his horse to a sharper canter. Love played no part in his scheme of things—a wife who would not expect too much, who would be humbly thankful for a little show of kindness (and to do him justice he was kind in his masterful, careless way to women and children), who would put no restraint on her husband's entire freedom. This was the ideal of married life which he set before him. If he had graduated in Mayfair he could scarcely have been more worldly-wise at twenty-four, for the wife who had all these negative virtues was not Mary Kelynge, the poor companion or governess—she was at best but a sort of sister, whom it would be quite safe to neglect—but Mary Kelynge the heiress.

No wonder he was gay and smiling as he cantered briskly. It was pleasant to be sniffing up the sweet summer air, the thousand odours of hedgerow and field; pleasant to get away from his father's sneers and his mother's sad looks, and perhaps even from that task of playing brother which sometimes palled a little; pleasant to entertain himself with visions and fancies and hopes that every hour were turning into realities.

For the months were slipping away one by one; five of them had gone by since the vault had closed over the remains of old Mr. Hallett—five months without a sign, a hint, a whisper, that the heir still lived and would come to claim his own.

He was dead—without a doubt he was dead. Any court of Equity would presume it. There was scarce a chance in a thousand that he would win; the game was in Andrew's own strong young hands. Was it to be wondered at that when he rode in at the lodge gate and drew rein that he might walk his horse under the shade of the beech avenue, he should already look about him critically, keenly, as if with the eye of a master?

When Andrew had finished his business with the bailiff he remembered a message that took him to the house.

He knew that he should find the housekeeper there in charge, and without difficulty get admission to the library to fetch a book Miss Kelynge had expressed a wish for. His horse had been taken to the stable, and he was in no haste to return. He sauntered up to the door, which, a little to his surprise, he found thrown open. The afternoon sun streamed into the low wide hall, touching the portraits on the wall, and bringing out odd looks of smiling or serious intelligence on the painted faces, touching, too, the dead man's possessions as his hand had relinquished them—his hat, his great-coat, a pair of gloves—hastily pulled off and still bearing the impress of the fingers that had worn them—the stick that had supported his last steps—all these poor, material things that live on to stab and wound the love which death has bereaved.

They held Andrew for a moment, while he looked at them with a kind of resentment. What right had they to remind him of the old man who was gone—dead, buried, forgotten—whose day was over? "It is my day now," he had been saying to himself all the afternoon. "It is my day now," he repeated, half aloud, looking round him at the silent family audience, as if he dared them to deny it.

He turned to the library, to do his errand there first before he went in search of the housekeeper, and of the bread-and-cheese and home-brewed ale she was sure to offer.

The library was a badly lit and rather sombre room at all times, the dark oak of the wainscoting and bookcases absorbing the light; and to one entering it from the vivid outer sunlight it had more than its usual obscurity.

Andrew went into it blindly, as one who feels his way, and he had more than half crossed it before he was aware of a figure seated in the further window.

"Is that you, Mrs. Carter?" he asked, but almost before he had uttered the words he knew that it was not the housekeeper, and he went on—'Don't be savage with me, Lavy; it's so dark here I couldn't make you out, and I didn't expect to see you here."

"Didn't you?" said Lavy; she turned her head in his direction, but she did not rise from the window seat. "I expected you: that's why I'm here; I came on purpose."

"Did you really? Awfully good of you, I'm sure." Andrew seated himself on a corner of the

writing-table, where he faced the light. "If I had known you wanted to see me, I would have gone round by Chalk End on my way home."

"There was a time, not so long ago, when you came without waiting for me to send for you," she said, with a note of suppressed feeling in her voice.

Andrew's ear was quick to catch the accent. He knew, as he himself would have expressed it, that he was in for a scene, and he mentally pulled himself together. He did not like it; he systematically avoided "rows" when it was possible, but since this one seemed to be inevitable, he faced it philosophically.

"Do you know why I have stayed away, Lavy?" he asked.

"Yes," she said, turning upon him suddenly; "I know why you have stayed away, but it will interest me all the same to hear your reasons: they're sure to be very convincing."

He had expected tears perhaps; vehement reproaches at the least, and for a moment he was taken aback; but he rallied quickly, and said, "Unfortunately they are only too convincing, as you say. I stopped away because I saw it was no good going on as we were doing, Lavy, since our fancy for each other could lead to nothing—to nothing but unhappiness for you and me." She stood and listened so quietly that he felt it difficult to go on. "Even if we had ever seriously thought of it we could never have married; my father would never consent."

"You have been a good while in finding that out."

Her composure reassured him, and he went on more fluently.

"I used to think I could get round him. I counted on my mother; she would do anything for me, but the governor has had losses lately, and he is in an awfully bad humour. He gets his knife in, I can tell you! It's scarcely possible to live with him, and there would be no end of a row if I were to propose to—"

"To introduce a beggar to the family."

He had been quite sure Lavinia was going to be sensible and reasonable, and to let him off without that scene which he did not care to face, but he was not so sure now.

He got off the table and went a step nearer her.

"Look here, Lavy," he said, "there's no use taking it like that. There's no girl in the world I care for so much as I care for you; and you know it very well." She laughed a little bitterly, but he went on, with a stronger protest. "If I were independent and free to marry to-morrow, you are the girl I would choose, but what can I do? My hands are tied"—he gave a shrug of his shoulders—"I am in my father's power. I am not even a junior partner. He loves to be master, and he keeps me out as long as he can. He talks of giving me a share at Christmas, but do you suppose he would do it if I were to displease him? He would turn me adrift without the smallest consideration. Even if by some miracle he let me keep my stool in the office, I am but a clerk, with a clerk's pittance. I can't ask you to share a beggarly lot like that, Lavy."

"You are very considerate."

"I've got to look ahead," he said, a little doggedly, stung by the persistent contempt of her tone. "I've got to see things for both of us as they are. It's all very well to talk of love, but love won't butter our bread or put clothes on our backs; and my father will do nothing. There has been an awful row with Mellish over your father's business, and he wouldn't give his consent to our marriage if we were to go from here on our knees to ask it."

"So those were your reasons?" she said at last. She turned her head, and searched him with her great dark eyes. She looked very handsome, with the deep flush of anger on her cheek and its light in her eyes. He remembered that other face that he had left behind him an hour or two ago—that other poor plain face that had kindled, too, under his words and looks, but that never, even when most loving, could be fair to see; and he suffered a sudden pang of regret. Lavy had never been so prized or appreciated by him as now at this moment, when he was about to relinquish all claim to her. The temptation to play the lover—the despairing lover—just once more was strong.

He drew a little nearer.

"Lavy," he began, "my dearest, you'll believe me it has cut me up awfully; it has—"

But she suddenly arrested the words on his lips.

"Stand back!" she said, fiercely. "Don't come any nearer! Don't dare to touch me—or speak to me like that! It's an insult to breathe the same air as you. I have listened to you; now you've got to listen to me." She waved him back imperiously. "I shall be as plain as you, and a little more honest."

"Oh, you know how to be that!"

"Yes, I know how to be that. Andrew Hallett, you are a coward and a knave—a base coward! You have lied to me!"

He started back, stung by her measureless contempt, his swarthy face paling with dreadful anger.

"You are a woman," he said, hoarsely, "and so you are privileged to use words for which I should horsewhip a man within an inch of his life."

"Yes," she said, "I am a woman—an insulted woman—and I dare call things by their true name. You came to me—you sought me out; I did not seek you. I am a Moss. I know my place. I did not aspire to so fine a gentleman as Mr. Andrew Hallett. You came and made love to me, and I—I gave you all my heart. I am not ashamed to confess it. I was a fool—a weak fool—to believe in you, but that was my folly, not my shame. I cared for you enough to be poor with you, though you were so considerate in wishing to spare me—I cared for you enough to forgive you a good deal. Perhaps if you had come to me to-day and said, 'I have found another girl whom it suits me better to marry, or at least to make love to in the meantime—a girl who has splendid chances, and who will make her husband rich and honourable,' I might have

forgiven you, even if I had despised you. Your sincerity might have saved you, but you came to me with a falsehood on your lips—"

"Take care," he said, still white with his passion; "there is a limit even to what a woman dares to say to me."

"There is no limit but the truth," she said. "Oh, never fear, I'll keep well within the truth. You came pretending to care for me still—to be very sorry to lose me. You thought, perhaps, it would please me to hear that. If you think so still, I may tell you I would die sooner than marry you."

"If you hate me so much," he said, striving to recover his composure, "it will be the easier for us to part. And perhaps if you have finished annihilating me—"

"I don't hate you," she said, calmly; "my feeling for you isn't strong enough for that: I only despise you. You needn't go yet."

"Have you any more pleasant things to say to me?"

"Only one thing; I won't keep you long, and it is the last time I shall trouble you to listen to me. You were quite right not to hint at your plans, your schemes, your hopes, for they may betray you yet. It's a wicked game you are playing"—she spoke with more feeling than she had yet shown—"you are drawing a poor girl, who doesn't know any better, on to care for you, and by-and-by, if she disappoints your expectations, you will throw her over as you threw me over. You asked me a little while ago if I knew your reasons. I knew them a little better than you imagined, you see, and I tell you frankly—for I hate your roundabout ways—that if there's anything I can do to thwart your plans and save another woman from being treated as you have treated me, I will do it."

"Thank you for letting me know your intentions," he said, with an ironical bow, but with fury in his heart; "forewarned is forearmed. Is it your pleasure to end the interview now, because my horse has been waiting some time?"

"Yes," said Lavinia, who, it must be confessed, had shown a good deal of spirit as well as an abundant candour, "I've said about all I had on my mind: and now, to save your feelings—you see I can be considerate as well as you—I will go as I came, by the window, and you can fetch the book you want and ride away just as if you had never seen me."

But he made no search for the book, and when he left the library he looked so black and thunderous that Mrs. Carter, who had but heard of his presence in the house, started back half alarmed.

"You don't—do you feel ill, Mr. Andrew?" she asked. "Dear, dear, it's the long ride in the heat! Thomas says the mare was all in a sweat. You'll come into my room, sir, and drink a cup of tea before you start? The kettle's just on the boil."

He repulsed her offer so roughly that she drew herself up, looking rather offended; and Andrew, who was not habitually discourteous, and had, indeed, rather a good-humoured way with his inferiors, noticed it, and made a lame attempt to atone for his rudeness.

"It's the heat, as you say, that's upset me a little; it's frightfully hot. If you could give me a mouthful of whisky-and-water, Mrs. Carter, I think that would put me all right."

"Yes, sir. There's potash, if you prefer it to water. Poor dear Mr. Hallett used to say there was no drink to his mind equal to potash with a dash of whisky in it. Mr. Jones, the butler, used to repeat it many's the time, and as fine a cellar, he said, as there was in the county, if he had been able to drink it. The whisky is Scotch, Mr. Andrew, I believe, and very good; at least, so your papa was pleased to say the last time he was here."

At a lighter moment Andrew would have laughed at this allusion to his papa; but he was in no laughing humour. He had sufficient command of himself, however, to ride with an appearance of careless ease so long as he was in sight of the house. But when he had passed the lodge gates, and, glancing furtively up and down the high road, had made sure that Lavy was not in sight, he punished the mare for the rage and fury that were gnawing at his heart.

Lavy's scalding vials of contempt and scorn had scorched him as her tears and reproaches never would have done had she wept for a month at his feet. He did not fear her threats; he was far too careful and calculating a young gentleman to have written any of those foolishly compromising letters that are so damaging to a lover's reputation for wit and wisdom when they front him in the witness-box. He was not afraid of anything she could do, and yet he cowered and quailed anew under the remembered sting of her lash.

She had read him unerringly, she had found him out; and the love he had so lightly prized, so easily relinquished, went now to feed the channels of her hate.

### CHAPTER XVII.—HOW SIR JAMES WAS MANAGED.

LADY HEMMINGWAY had not at all cooled towards that project of sending Sir James to lunch with dear Cousin Emily. She was as hot over it as ever; only unfortunately it was James himself who had frustrated the plan by choosing an inconvenient moment for one of his little illnesses.

Sir James's bilious attacks were sometimes well timed, as, for instance, on those occasions when the Darbyshires sent a groom on horseback to Spens, bearing an invitation to tennis and an impromptu dance. It was then convenient for Lady Hemmingway to write a little note deploring that poor dear James had one of his bad attacks, and really could not leave his room. The Darbyshires knew quite well what this note was meant to convey, just as they knew Sir James could neither dance nor play tennis any better than a broomstick. There were six of the Darbyshire girls—six portionless girls, who would not have two thousand apiece; and Lady Hemmingway's pretty little underlined note said in the politest phrases that Sir James was a prize quite beyond

their reach. These things are perfectly understood in the genteel world, and even in the rural world of Eastshire; and nobody takes them amiss.

But the times when the weakness of Sir James's constitution fitted comfortably into the scheme of things were fairly balanced by the occasions when his ability to fall sick was quite as tiresome as if he had been a little boy with the measles, who kept his mamma from going to evening parties. His recent surrender, for instance, was most ill-judged, and Lady Hemmingway was too provoked by it to have any sympathy with his sufferings.

"You really give in too easily," she said, sharply; "when I have a headache I make a point of not yielding to it."

"It couldn't have been the King William sherry this time," said Sir James, who took a melancholy pleasure in tracing his sufferings to their possible source, "because I haven't been at Melchisford."

"Perhaps it was the sherry at home. I must speak to Cooper about it. Really, James, you are old enough to know what agrees and what disagrees with you. You ought to make it a matter of principle, as I do, to digest well."

"Perhaps it was the pie," suggested Sir James, neutrally. "Pie, especially if the cook is not careful to make a hole in the crust before baking, is very apt to disagree. It is the compressed gases that are hurtful, I am told."

"What does it matter what caused it?" asked his mother, irritably. "I should think it was quite enough to have had a headache for three days, as you say you have, without worrying yourself to find out how you came to have it."

"Four days," corrected the sufferer. "It began on Sunday; we had pie at lunch on Sunday—"

"James, James, I shall really begin to lose patience with you if you say another word"—most people would have thought she had begun already—"I will not have the dinners of a week past, the dinners that *I* have made a conscience of digesting, if *you* have not, dragged up before me in detail. It is enough to take away one's appetite completely."

"I beg your pardon, mother," said Sir James, with polite contrition; "I haven't much appetite myself this morning." He pushed aside his untasted coffee, and leaned his head upon his hand.

He looked so yellow and miserable that she might have had a little pity on him, but she had none. She would not hear of sending for Dr. Smee, though she was usually ready to summon the surgeon for the most trifling ailment.

"What you want is rousing," she said. "You must shake off your depression, James; you must not yield to it. If you want any more of the doctor's stuff you had better ride over and fetch it yourself, and pay a little visit to Cousin Emily. You promised, you remember, to call."

"I am afraid I couldn't stand the shaking today," said the luckless young man, looking up with a pair of eyes like boiled gooseberries.

His mother considered him scrutinisingly for a moment.

James was certainly not looking his best, and she reflected that it would scarcely do to send him a-wooing with a complexion like a guinea and the expression of a martyr.

"Well," she said, rapidly striking out a new plan, "if you don't fancy riding, you had better drive with me this afternoon. I am going to Melchisford, and you may find Dr. Smee at home. And, by-the-bye, James, now that I think of it, it would be as well for you to have another opinion before deciding to let Barnes have the lease of The Willows."

Sir James looked up, a thread of surprise crossing his melancholy features. His mind travelled rather slowly from one topic to another, and from the question of riding or driving to the letting of The Willows seemed a too abrupt descent.

"It is as good as settled," he said at last. "You remember, you wanted me to see Service, and I saw Service, and I thought—"

But his mother did not wish him to do any thinking.

"Service is all very well," she said, "and I daresay he was a good lawyer in his day, but he is getting old and stupid. I think you might begin gradually, you know, James—gradually, to transfer your business to someone else. I never interfere, as you know very well, James, but I advise, your mother advises, you; and I do think it is most important to have a good lawyer to look after one's interests, especially in these bad times. I hear excellently of Mr. Hallett."

"Hallett of Melchisford?"

"There is no other Hallett, I believe"—she snapped him up—"except our late neighbour in the county; indeed, it is just possible there is a distant relationship (Miss Kelynge is staying there); and it is well to have a lawyer who is respectably connected."

She rose from her place behind the tea-urn and pushed back her chair, and then she said, in a firm voice, the voice one uses to a little boy who is never allowed to be naughty:

"I am going to call on Miss Kelynge this afternoon, James, and you may as well come with me. You can do your little bit of business with Mr. Hallett in his office, you know, and then you can come to the drawing-room to fetch me. As you are not very well I will not ask you to do more than remain a few minutes; but you must be quite well next week—really quite well—no headache and no depression, James, because, since Cousin Emily is kind enough to ask you, you must, in common politeness, go and take lunch with her."

This was how Sir James was managed. The art, as it was practised on him, was not a fine art; it was indeed so rough and rudimentary, so entirely unskilled, that his mother may be pardoned if his clumsy obedience sometimes irritated her. To get your own way by a finely-practised diplomacy is a triumph, to get it by simply asserting it is as inglorious as defeat. And yet, to do Lady Hemmingway justice, Sir James was one of the people with whom it would be perfectly impossible to live unless you managed him. He was like a crookedly hung picture, which speedily becomes a torture unless you set it straight, and

he was usually quite as passive as the picture in allowing himself to be drawn into line.

He was ready obediently to take his place on the narrow seat of the carriage in spite of the unabated headache, which had scarcely allowed him to break his fast at lunch.

"If she is a kind girl," thought his mother, her imagination taking one of those onward bounds that leave lagging reality so far behind, "she will be sorry for his bad health; but I wish he didn't look so cadaverous and yellow. If it had been anything else—but a liver complaint isn't the least interesting, and few people have any sympathy to spare for it."

However, Sir James had to be accepted as he was, complexion and all, and his mother consoled herself by the assurance that in his neat and careful dress James always looked like a gentleman, though some, as we know, considered Cooper to answer the description still better.

In the course of the journey to Melchisford Lady Hemmingway administered a little more of the advice she was so careful to assure him was not interference; and interference it certainly was not, since Sir James had no scheme of his own which it traversed.

By the time they had reached the Red House he had learned his lesson sufficiently well to be trusted to repeat it correctly, and she left him to seek the office entrance while she went up the steps to the private door.

Hannah Mellish, from her post at the opposite window, saw the arrival. She knew the Spens liveries, and had no difficulty in identifying the tall stout lady in the modified dress of a widow that suggested a very comfortable stage of grief, and the well-brushed young man who got out of the carriage so carefully and handed his mother solemnly up the steps.

Hannah knew the widow and her son far better than she had ever known old Mr. Hallett and his niece, though Hallett Place was nearer by several miles to Chalk End than Spens. Lady Hemmingway had come more than once in her pony-carriage to the farm when Hannah reigned there to bargain for spring chickens and butter when Spens had a summer influx of visitors, and its own resources were taxed. Hannah knew her as a rather condescending great lady with very defined ideas as to the price of farm produce from a buyer's point of view; and here she was, going up the steps of the Red House as a visitor—an equal. A little streak of bitterness crept into Hannah's musings; it seemed to her as if all the desirable things of this world went up that opposite flight of steps—fashion, friendship, ease, prosperity—all the gaiety and charm of life. The bank-house had been strangely silent these many days; no fine carriage was reined up there, nobody had laughed or sung in it for ever so long. Hannah did not know what was amiss, but her world was cold and bare and large about her; even the fickle sunshine had crossed the street and left the bank in shadow.

Hannah did not know that behind the drawn blind, which the afternoon warmth could not penetrate, her sister-in-law was lying with a throbbing head, and a heart that kept it sad companionship in aching. Mrs. Hallett had looked so ill after one of many sleepless nights that Hester had persuaded her to lie down and rest.

"Everybody has called lately; you will not miss anyone, mother; and besides, Mary and I will be at home if anybody should come."

Hester had to use many persuasions before her mother would yield. She would not own that she was ill or tired, or that anything was amiss; it was only when Hester said, "Papa will be quite shocked if he sees you looking like that when he comes up to dinner," that she gave in and allowed Hetty to darken the room and bathe her head with eau-de-Cologne.

"That will do, dear," said her mother at last. "I heard the bell a minute or two ago; perhaps your father has sent for something he wants."

"It is only Sophy Barker," said Hester, "come to exchange the club books. I will leave you, mother, if you will promise to rest, and not to move till I come for you. I won't let you be late for dinner; you may trust me."

Mrs. Hallett gave the promise Hester exacted, glad to be left in silence and peace to entertain her anxious thoughts, and to wear as sad a face as she pleased.

Hester, finding Sophy Barker and Miss Kelynge maintaining a difficult conversation in the drawing-room, proposed an adjournment to the lawn, where some little Japanese tables and basket chairs made a pleasant corner under the lime-trees.

Sophy was easily enough persuaded to remain for the afternoon, and produced from her pocket a compact roll of embroidery which, with praiseworthy foresight, she was preparing in advance of a possible trousseau.

"What patience you have!" said Hester, taking up one end of the long punctured strip which Sophy's diligent fingers had traversed. "But suppose, Sophy," she laughed, mischievously—"suppose the husband never comes? Do you know there are twenty girls here in Melchisford to one eligible man? Andrew made the calculation one day. Isn't it insufferable to think what an immense superiority of choice that leaves the conquering sex?"

At the mention of Andrew Mary blushed one of those sudden, deep, uncomfortable blushes that seemed to hint at depths of unrevealed guilt. Were there nineteen girls in Melchisford who would suffer because—if—"

"I suppose I shall want some clothes even if I don't marry," said Sophy, who was rather prim and proper; "and Melchisford isn't the only place where there are young men."

"No," said Hester, lying back and clasping her hands behind her head, "there is the wide world—the wide world that may end for some of them—who knows?—in our own little Melchisford!"

She looked at Mary with a smile, but Mary was still occupied with that vision of the nineteen girls who would rise up to cry out against the one—the one blessed above all the others whom the hero might choose, and she failed to catch the look.

Hester was very gently gay that afternoon with a new inrush of ease that came she could not tell

whence. She was glad that she had persuaded her mother to rest. If the mother would but get well and come downstairs with the old placid look on her comely face, it seemed to Hetty as if the jangling music of the household would straightway become tuneful again. On so rare and perfect a summer's afternoon it was difficult to entertain forebodings or unformulated fears.

It was to this little group that Lady Hemmingway was presently led. She had seen the young people from the window, and had surprised the parlourmaid by saying that she would go out and join them. The maid came first to announce the illustrious visitor, and at sight of the tall, darkly-clad figure approaching them over the grass the girls all rose, Mary clutching the arm of her chair and Sophy dropping her scissors and thimble. Hester alone maintained her perfect ease and serenity. She had pulled her own chair forward and established the visitor in it before that lady had quite made up her mind which of the three she was there to distinguish with her notice.

Hester soon settled the point by saying, simply, "I am sorry my mother is too unwell to leave her room this afternoon. She will regret not having seen you."

"Ah, then you are Miss Hallett," said Lady Hemmingway, still gracious, but inwardly disappointed.

"This is Miss Kelynge," said Hester, understanding the position of matters at once. "Mary, will you take my chair? the sun is in your eyes where you sit."

Lady Hemmingway looked with a good deal of interest at poor Mary as she distressfully changed places with Hester. It seemed to her at that moment that Nature had made one of her unaccountable mistakes in dowering a mere country lawyer's daughter with such decided beauty and defrauding the possible owner of sixty thousand a year of so much as ordinary comeliness. Even that other girl—doubtless some shopkeeper's daughter—who hung so diligently over her sewing, had better points. But sixty thousand pounds covers a great many blemishes; and depend on it there would be others besides Lady Hemmingway who would presently find poor Mary quite pleasing, and even pretty, when this comfortable income came to be hers.

"My dear Miss Kelynge," she said, "it is so strange that we meet now for the first time, we who have been near neighbours these many, many

LADY HEMMINGWAY IN SEARCH OF MISS KELYNGE.

years. But in my husband's lifetime we were much in London, and your uncle, you know, was quite a recluse. We never could persuade him to come to us even for a quiet dinner."

"No," said Mary, "he went nowhere."

"And you, of course, were at school."

"No," said Mary again; "I had a governess. She was at Hallett Place for three years, and then she said it was dull, and she went away, and I never had another."

"Ah," said Lady Hemmingway, covering the little blunder adroitly, "I thoroughly approve of home education. If I had had a daughter she should never have been allowed out of my sight. I could not even let my son go to a public school, though Sir Robert insisted on his going to Cambridge. My boy is all I have, you know, and he is very precious to me."

"Yes," said Mary; but she was thinking of someone else who was an only son, and doubtless very precious to his mother too.

The visitor was very gracious, but she found Mary rather unresponsive. She hoped she was going back to Hallett Place soon: it was a pity to run away from such a charming home.

"We called there at once," she said, "but you had flown. It was all very sad, and I daresay it is more cheerful for you here; but you must not quite forsake us."

"I don't want to go back," blundered Mary; "I should like to stay here always."

"Oh, fie!" Lady Hemmingway shook a playful finger at her. "You really must not desert your order. Think what a boon it would be to us to have such a pleasant neighbour! We are very quiet at present too. Will you not come to us for a little, and help to cheer us? We ought to combine our forces; you should have my company all day, and my son would do his best to amuse you in the evening. He is a very good son, and scarcely ever leaves his mother."

Mary listened with a heart that beat in dull alarm. To leave the Red House where she was so happy—to go among strangers! Fortunately Lady Hemmingway did not press her for a reply, being now moved to include Hester and the diligent Sophy in the warmth of her regard. She admired the ripe old garden, and she had even a word of praise for Sophy's laborious embroidery.

Hester was dispensing tea when Sir James, accompanied by Andrew, crossed the lawn. The young men had known each other at Cambridge, but their slight intimacy had been suffered to lapse from a lack of any mutual taste.

The decorous Sir James might have told certain tales, if he would, of the solicitor's son, and sure it is that young Andrew took no trouble to hide his very indifferent opinion of the baronet's merits.

"Did you ever see such an arrant muff?" he cried, when the visitors had taken their leave. "Such a prig! He's as pleased with himself when he remarks that it's a fine day, as if it were a witticism. Oh, he's a good boy, an excellent little boy, with the nicest little manners in the world! That invincible content is an excellent quality; it served him a great deal better at college than genius. He was such a good boy that the dons never wanted to whip him and put him in the corner."

"As they whipped you, and put you in the corner," said Hester, looking at her brother with a smile which included him in her content. "Sir James is very pleasant, Drew, and he didn't spill a single drop out of the teacups."

"Do you hear that, Miss Kelynge?" cried Andrew (it was Miss Kelynge in public). "He will wait on you as if he were hired for it. Oh, you will find his respectable platitudes very soothing when you go to Spens."

"But I am not going to Spens," said Mary, with a note of alarm in her voice. "I—I didn't promise, and I am not going."

"You would rather be here—you would rather stay with us?"

Nobody but Mary heard that low-voiced question, and her uneasy consciousness responded to it in the usual way. It was cruel of him to ask it, since he knew well enough where her inclination lay.

Hester was busy still with her teacups, and Sophy was neatly rolling up her embroidery before going home.

Sophy's blue eyes were very round, and filled with wonder tinctured with respect as she looked at Andrew Hallett. A young man who could speak so slightingly of a baronet, as if—as if he were made of common clay like other people!

Sophy was sure that the baronet's mother was very unlike other people. She had rolled up that lady's high-voiced word of praise with her embroidery, and was carrying it home for the family ear.

## CHAPTER XVIII.—"AS IN THE OLD TIMES."

LADY HEMMINGWAY took the occasion of her presence in Melchisford to do a little of the shopping that is a necessary bit of a country lady's life. If it were not for that need, real or imaginary, of buying something, life in Eastshire would present insupportable depths of dulness. The tedium of many an afternoon is charmed away in choosing, selecting, examining, as the enterprising draper very well knows.

When Sophy was going home to relate her adventures at the family tea-table she saw Lady Hemmingway in the act of descending at the parental shop, her father himself, bowing and bland, ushering in the widow.

Sophy blushed, and ran a little faster. The Barkers lived in a big handsome house outside the town. The daughters had been well educated, and the sons aspired to something better than a place behind the family counter; but though they were received in Melchisford, Sophy knew that there was a distinction and a difference, and that she would never be invited to play at bagatelle with Sir James, or produce her Madeira work in Lady Hemmingway's drawing-room.

Sir James was not with his mother. Even so docile a young man might be expected to draw

the line of his compliance at the inspection of autumn novelties; he had been sent to the surgery to have that little consultation with Dr. Smee.

But when Lady Hemmingway had finished her examination of Mr. Barker's latest purchases, it was so late that she found she could not put Emily in on that occasion, Emily usually being "taken" along with the groceries and draperies when her cousin had a spare afternoon for the claims of Melchisford.

"And it is very provoking," she said to herself, "for I did want to see Emily." It was, therefore, quite a kind stroke of luck that just as Fanny was leaving Barker's door the doctor's little wife should trip in.

"My dear Emily, I am delighted to have met you," cried Fanny, embracing her cousin with a cordiality that was a surprise to the bowing and deferential Barker. "Since I haven't time to go home with you, you must go with me to Allen's; you really must."

"But I want to buy myself a new jacket," said Emily, with laughing remonstrance. "I really have set my heart on outshining everybody at the bazaar on Tuesday. As a doctor's wife, you know, Fanny, I have so few solid satisfactions"—she looked at her cousin sideways with merry eyes—"that you must not deny me this one."

But Cousin Fanny was firm.

"The jacket can wait," she said; "I have not bought one. I have told Mr. Barker that I will consider the matter, and come again another day."

"But the jacket may disappear on somebody else's back in the meantime."

"Nonsense, Emily; you live here and can come at any time, and I want particularly to speak to you."

So Emily was carried by this more powerful will to Allen's, where groceries were to be had a fraction cheaper than from Cheeseman, in George Street; and on the way she was told of the visit that had just been paid to the Red House.

"A charming old garden!" said Fanny, willing to be gracious to Emily's friends, "and Miss Hester is very pretty."

"Hester is beautiful." Mrs. Smee spoke with conviction. "If she were in London everybody would run after her. Melchisford scarcely knows how to appreciate her." Then she looked at her companion mischievously.

"Wasn't it a little indiscreet to introduce James to such a very attractive girl? He might possibly, just possibly, mistake her for the unattractive one."

"James will never forget what he owes to his position," said James's mother with a bridling chin. "He will not disappoint my expectations. He and the son—that very forward young man—were at Cambridge together, but James has not kept up the acquaintance; he will never do anything foolish."

"No," assented Mrs. Smee dryly; "you are right, Fanny, I don't think he ever will."

"He is very discreet, he has a great deal of common sense; he will certainly not do anything foolish."

"Oh, certainly not!" cried Emily again. "You may feel quite comfortable about him when he comes to lunch with me. He will say just the right things and keep his eyes in the proper quarter. I am afraid he must be a little tired of waiting. Henry is not at home: he was called off to Broomfield; there is no one at home except little Harry. Perhaps James may have gone to the nursery."

"You know quite well he doesn't like children," said Fanny, feeling that she ought to be offended, though she scarcely knew why. But it was no use being offended with Emily, whose house was so conveniently placed for accidental or premeditated meetings; and she was dismissed graciously at Allen's door.

"Go and buy your jacket, you extravagant young woman, and, by-the-bye, you may as well ask Barker what is the lowest price he will take for that black velvet dolman with the feather trimming. Feather trimming is quite unheard of in town, and he really ought to reduce it. You can send me the message by James next week."

Mrs. Smee made a little grimace after the departing carriage; but she duly went on an early day of the following week to invite the young people from the Red House as she was commanded.

As she walked briskly along George Street she glanced across at the windows of the bank house. A subtle, vague, and undefined uneasiness existed in the public mind with regard to Mellish's bank. It took no definite shape in words as yet, but it was in the atmosphere. No one knew how this wordless rumour had arisen, whence it had come, who had first breathed it on the summer air; whether, indeed, it were to be treated as one of those malign breaths to which private enterprise of this sort is specially sensitive—with the indifference it deserved.

Mrs. Smee had her own private opinion, coloured, no doubt, by the "they say" her husband brought home with him from his rounds and imparted under the seal of secrecy.

"Now, look here, Emmy, there's to be no chattering, and no confidences over the tea-cups," he said to his wife. "Mellish is a good fellow, who gives himself none of the stuck-up airs of his brother-in-law; and if he's in a hole, I'm not going to push him in deeper by any word of mine, so remember."

"Of course I will remember, Henry," said Mrs. Henry, who, though she loved a laugh at her neighbours' expense, had a kind heart. "I would not hurt that good fellow for the world; but do you think it's as bad as that?"

"I don't like his look; a ruddy, stout-built man like Mellish doesn't turn lined and haggard and lean about the jaws all at once for nothing," said the doctor, arguing from the outer to the inner man as doctors will. "And they say," he added significantly, "that Hallett has withdrawn his account. You may be sure Hallett will save his own neck whoever suffers; but mind, not a whisper of this."

Mrs. Smee was to be trusted, as her husband knew, but it was with this knowledge in her

mind that she went on her visit to the Red House.

Mrs. Hallett was downstairs that day and alone, but though the doctor's little wife went in with her gayest look and smile, and with the most unconcerned air in the world, as if no such thing as an adverse whisper had reached her ear, she knew in a moment that the shadow of possible calamity had fallen on the Red House too.

Weeks of suspense had wrought a change in Mary Hallett, as well as on the banker across the street. That placid, pleasant face that had kept its serene youthful comeliness so long unimpaired had grown of a sudden old. The visitor could scarcely help a start of shocked surprise as she noticed the washed-out tints of that once pink colour, and the drawn and tremulous lines about the mouth, but she kissed her hostess with a successful dissembling of cheerfulness.

"How cosy you look here!" she said. "Yours is the first fire of the season."

"I—I felt it a little cold,' said Mrs. Hallett, in faint apology; "the autumn is early upon us this year."

"Yes," assented the doctor's wife, with a furtive glance at the outer brightness — the weather which had affected this amiable creature was from within.

Then she hastily delivered herself of her errand. She was rather eager to be gone, feeling as if she had pushed her way into a confidence not meant for her.

"Sir James is a stupid creature," she said, lightly. "Since he is a baronet with a good rent-roll one may be allowed to call him that, I suppose; and if the young people will help me to support his dulness it will be a real godsend. If I am left to his unmixed company, I shall very likely do something desperate: that kind of invincible self-satisfaction always makes me feel murderous."

She ran on lightly of set purpose, but Mrs. Hallett only took in the beginnings of her phrase. She caught at the invitation eagerly.

"The girls will be delighted to go," she said; "it is dull for them: there is so little to amuse young people in Melchisford. I can answer for them—they will go with pleasure."

"And you must let them remain for the day," said Mrs. Smee, mentally enlarging her hospitable design. "Sir James won't afflict us for long; he must make a compromise for once with his digestion, and take it home with him after lunch. Then Hetty and Miss Kelynge and I will be cosy and say as many foolish things as we like, and we shall have my naughty boy from the nursery instead of the good boy from Spens to amuse us."

Mrs. Hallett smiled faintly, but she remembered to ask all those questions that make so large a part of matronly talk. A woman with the maternal instinct can interest herself even in face of the worst calamity in a neighbour's baby.

She was far more keen the next day to let the young people have this pleasure than they were to accept it. Hester had that love of home that had come almost to have the strength of a passion difficult to combat; and as for Mary Kelynge, her every appearance in society had led to so many humiliations that she had very little taste for that kind of martyrdom. She was reconciled in a measure, however, when she heard that Andrew had promised to dine at the Doctor's table and bring the girls safely home. That young man had already come to be in her fancy a bulwark against all alarms.

When the girls had set out, Mrs. Hallett, instead of sitting still and listening with many an anxious start and flush and pallor, as so often of late, busied herself with an almost feverish activity. Even in her anxiety she had not let her housewifely duties lapse, but she seized upon them now with a new vigour. She made the drawing-room, emptied of the girls' presence, as attractive as lay in her skill with flowers fresh cut from the greenhouse, and with a fire that filled it with a dancing brightness of flame; she ran down to the kitchen and startled the cook by the rare peremptoriness of her orders. If an emperor had been her dinner guest she could not have shown more zeal in her choice of dishes. It was her woman's way; her instinct had taught her that, if not the noblest, it is at least a sure way to melt the coldness out of a man's heart. Fill the cup of his comfort to the brim, and your tyrant must needs thaw from his tyranny.

Mr. Hallett perhaps scarcely deserved the name of tyrant, but the cold and bitter anger in which he wrapped John Mellish and his doings had crept into his relations with his wife too, and chilled them. Since the day she had paid that visit to the banker she had been allowed to know her husband's disapproval; and the knowledge made her miserable.

To get a little nearer him, to entice him back by a scrupulous study of his tastes and fancies, her simplicity taught her no better design, and perhaps the utmost cunning could not have suggested a surer.

When he came moodily into the drawing-room before dinner, at the sight of his wife—her cheeks bright with blushes, her dress betokening an unusual care—he lifted his brows in surprise. He glanced round the room, mechanically marking its newly-festive air; his nostrils inhaled the savoury suggestions of good things waiting to be eaten in the dining-room, and his mood perceptibly lightened. Man is, after all, a fallible creature, and while he lives in this world often the shortest cut to his good-nature is through his stomach. Every good wife knows this, and if she does not, she has but ill learned her business.

"Why, Mary," he said, bringing his glance with more of intelligence and scrutiny in it back to his wife, "you look as if you expected company."

"Nobody but you, dear." She laid a hand on his sleeve as he approached to share the hearth-rug with her. Her faithful eyes were looking into his, pleading, as it were, for his kindness.

"We are quite alone to-night; that is why it seemed to me we ought to have a little feast all to ourselves. The children are out, and will not be back till late, and we are alone—just as we used to be in the old days."

There is no man, unless he be utterly distempered, who can withstand this delicate flattery. Children may certainly be a bond linking husband and wife closer together—and there was no mother who loved her children more truly than this one—but wifehood comes before motherhood, and there are moments when its claims are supreme. To regain her place in her husband's heart, to re-establish the old sympathy, was her most exacting need, and for once she was glad, almost fiercely glad, that the children were out of the way, where they could not come between her and her desire.

He seemed to understand her—in the imperfect way in which many a man understands even the woman who has shared the better half of his life, for she is at best but as a book in a foreign tongue to him. His blunt masculine perceptions wholly missed the finer shades and subtleties of her meaning, but he perceived that she was penitent and humble, and his kindness came back with the discovery.

"You might well make me forget the years that have come and gone since we began the journey together," he said, and he stooped and kissed her.

She lifted her hand from his sleeve to his shoulder: she was moved and shaken by his caress.

"Andrew," she said, "don't let anything come between us. Even if there should be one question about which we differ—" she caught her breath.

"You mean your brother John," he interposed, with a momentary return of his gloom.

"He is my brother," she said, pleadingly; "we were brought up together—he was all I had till you came—"

"Well, well," he said, keeping a hold on his gentler mood, "I don't forbid you to go to him if your feelings draw you that way. It is natural, I daresay. I don't say that you are not to go to him, though I say he is not to cross my threshold again."

"What has he done?" she asked in a low voice, which had great trouble in it; "it pains me to be kept in the dark. If you would but tell me, Andrew, I could bear it better."

"You won't be kept in the dark long," he said gently; "you'll know soon enough. But I don't forbid you to go to him," he added, with a tinge of the old pomposity; "nobody shall say that I hindered his sister from going to him at the last."

"Is he going to die" asked Mary, with a new terror at her heart.

"Die!" cried the lawyer with supreme disdain. "Nothing so good. There," he broke off abruptly, "you needn't meet trouble half-way. There's a smell to give one an appetite coming through the door; come, and let us have our dinner as we used to have it before the bairns came to plague us."

She tried to respond, and to get all that she could out of their dual solitude, as if she would entice the old times back. Old memories were at work in him too, and he was softer of voice and manner than he had been for many days. He resolutely put his cares out of sight, and as they sat by the hearth after their meal he set the talk to a lighter key. He spoke of the children.

"I had a letter from my half-cousin Mrs. Chester a day or two ago," he said; "it may be in my pocket." He felt for it. "No, I must have left it in the office. She spoke of Hetty, and expressed a wish to have a visit from her. The child ought to go, Mary; she has seen nothing of the world."

"Yes," said her mother, but hesitatingly, "I suppose she ought to go some day—if a girl must see the world."

"You have got on very well without it," he smiled; "but Hester—Hester must do much better than you have done, Mary."

"I could never wish a better lot for her," said Mary, eagerly. "I have been very happy, Andrew. If Hetty has as good a chance—"

"We must be ambitious for her," he said, slowly. And then he added, with an odd edge of abruptness, "Miss Kelynge—what sort of a girl is she?"

"She is a good girl," said Mrs. Hallett, wondering, but conscientiously trying to reckon up Mary's virtues, and finding nothing but this bald phrase to sum them with—"a good, simple-minded girl."

It was on the tip of her tongue to ask her husband if he had noticed that Andrew was beginning to be influenced by this goodness—this extreme simplicity of character (it was her kind way of saying that the girl was a little stupid); but when she glanced at him and saw his almost careworn looks bent on the flame, she refrained. He might not have noticed, and it might but supply a fresh worry to draw his attention to it.

At that moment, too, a prattle of voices interrupted with laughter was heard in the hall, and the door opened to let the absentees in. Andrew's step went onwards down the corridor, but the girls were already on the threshold.

Hester came first. With one quick glance at the pair by the hearth she felt that peace and healing had come back to her home, and her beautiful face glowed with a smile.

"We have enjoyed ourselves," she said, "and Sir James—for a baronet—is—"

"Oh, don't say he is nice, Hetty," cried Mary, with unusual fluency, "because he frightened me so!"

"He didn't frighten me," said Hester, gravely—"not even by his biggest words. See how bold I am! That is because I am a country girl, father and too provincial to know any better."

She was leaning over his shoulder, and he pulled her round and down beside him.

"Should you like to go to London, my girl?" he asked.

She looked across at her mother, and the smile dawned again in her eyes.

"I like home best" she said.

# A VENERABLE ART.

ST. MARTIN'S—THE LANGDALE SPINNING HOME.

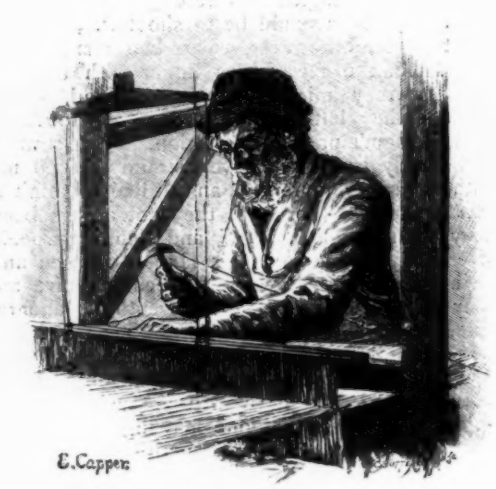
I THINK it is Mr. Ruskin who says somewhere that if an Englishman were now to see a fairy his first idea would be to shoot it. Here in Westmoreland, however, we are better mannered, and I think a few fairies linger with us still. Perhaps they migrated from Scotland, which country they left in 1764, according to Allan Cunningham's precise calculation. Some strange and kindly influences have certainly helped me with my spinning revival, and I like to think it was the fairies—for have they not always been busy with spindle, distaff, and spinning-wheel? Everybody who is up in his Hans Andersen and Grimm knows that much. Especially active are they on St. Distaff's Day, the seventh of January, when the little folk inspect every wheel; and woe be to the idle maid who has neglected hers!

Spinning and weaving are after all only trades, though the poets have written such beautiful things about them that one may dignify them by the name of arts. From Theocritus to Horace is a far cry, but through all those two thousand years, and earlier, in epic, lyric, and national chant, the shuttles gleam and fly, and the distaff is the emblem of virtue and peace. That is in poetry: in hard matter of fact prose I am compelled to own that here in England, at any rate, since the year 1787, when spinning by machinery first came in, hand spinning has been one of the lost arts.

It is just six years ago that the idea came into my head to try and revive the old industry. A great many motives led me to make the experiment. First of all I wanted to give work to the many poor women scattered up and down our Langdale Fells. Wordsworth had eloquently called upon us to restore

> "The venerable art torn from the poor."

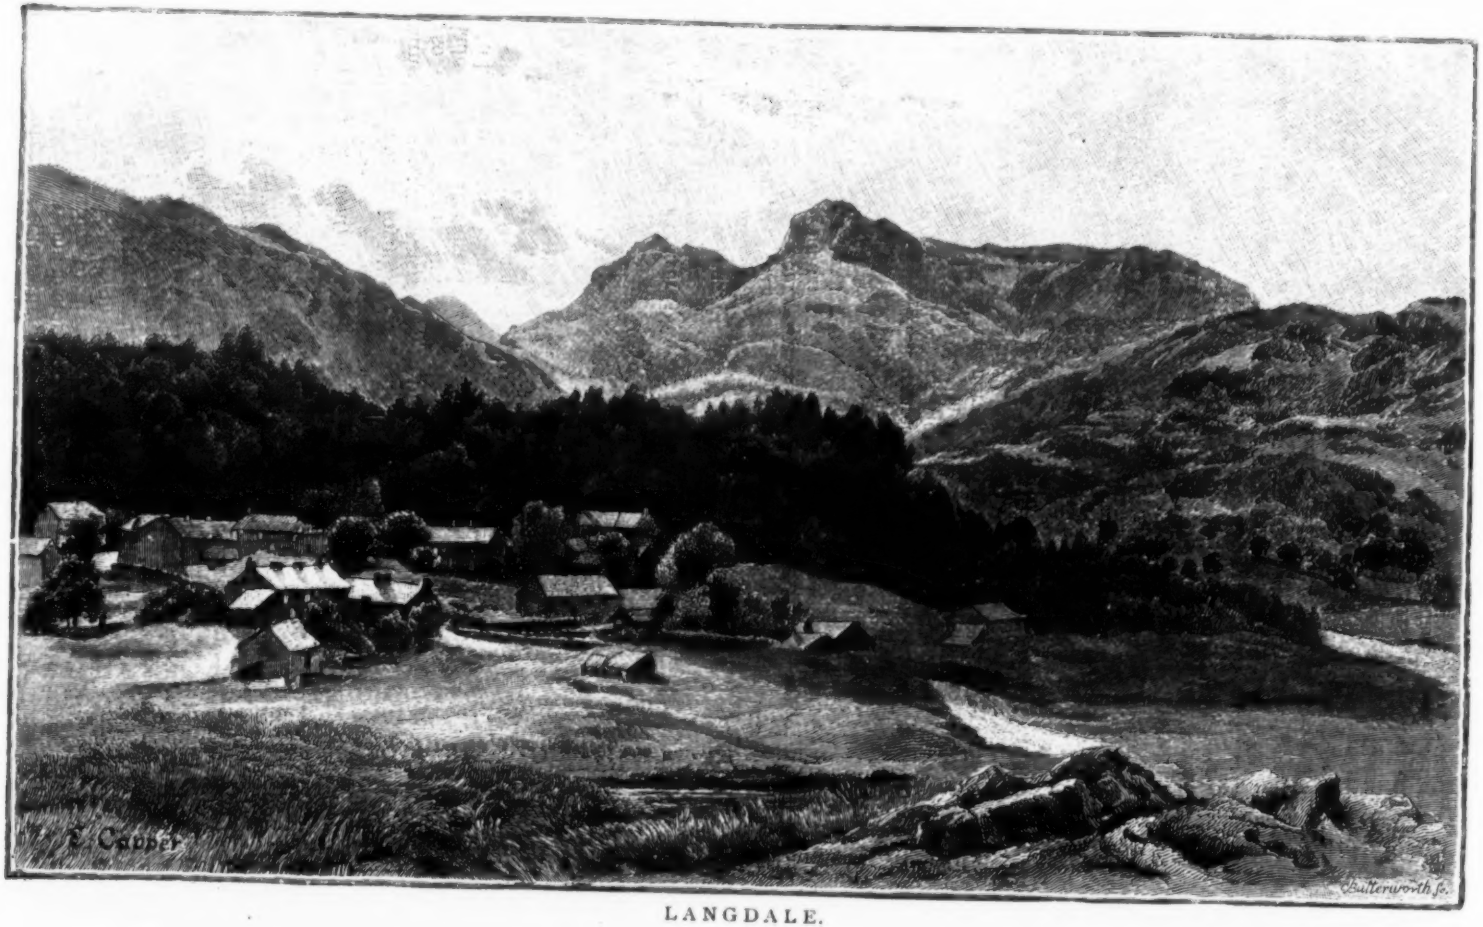
And Mr. Ruskin had again and again appealed to English men and women to spin and weave; so it seemed fitting that the venture should be made in Langdale—a valley just half-way between Rydal Mount and Brantwood. What Langdale is like may be seen from our illustration. The valley is closed in by the circling hills, and at the north end the famous Pikes keep watch and ward. A selfish motive also came into play, for I myself longed to possess linen that I could hand down



to my grandchildren; and I thought other old-fashioned people might also be tired of machine-made sheets that were always wearing out and wanting sides joined to middle.

In my drawing-room stood an old spinning-wheel, daintly fashioned in ebony with little ivory tips, and round the distaff still clung a hank of flax, discoloured with the dust of unnumbered years. The fairy godmother who came to my assistance was an old woman in the village bent double with the weight of ninety years. She was clearly possessed of some magical powers, for when she sat down to the old wheel it answered instantly to the touch of her bent fingers; it suddenly seemed to wake to life. Round and round it ran with many a creak and groan, and there in a few minutes was a good thread spun on the wheel that had so long been silent. My fairy prince (for every fairy story must have its prince) lived in his palace of art at Brantwood. Of course he was not really a prince, but a magical old professor, which is every bit as good. When he heard of my little enterprise he wrote and said beautiful things, which put us in very good heart. And, indeed, we wanted encouragement very badly, for imps and goblins and wicked genii opposed us tooth and nail, and said many evil things of us and our work: such as that it was sentimental, Utopian, unpractical, and fanciful, and that no reasonable person ever wanted linen to last fifty years, and that it would be very bad for trade if it did. But we left them to grumble, and set to work.

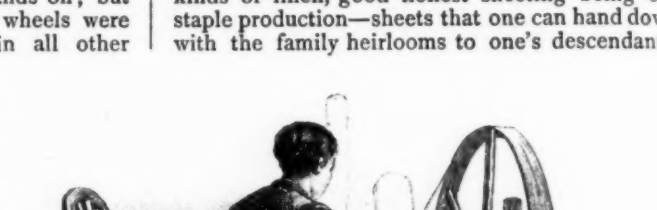
I rented a pretty cottage with a loft for weaving, and a nice lawn to bleach our linen on. It bore the date 1692 on its front, and we dedicated it to St. Martin, because he was a great favourite of Mr. Ruskin's, and a practical hard-working saint to boot. The drawing on the preceding page shows our little spinning home as it stands on the banks of the Brathay, sheltered underneath the hills and trees of Elterwater.



A HOMELY SIGHT.

GOOD OLD JOHN.

Then from a cellar in Kendal we routed up an



LANGDALE.

ancient loom. It was landed in a score of pieces one wild winter's night in Elterwater. It had been difficult to find; but how much more difficult to fix! It was very humiliating to discover that after hours of labour we had set it up the wrong way round. But by degrees we grew wiser. The next step was to get wheels. We scoured the country side, and begged, bought, and borrowed every old wheel we could lay our hands on; but by-and-by we discovered that old wheels were sentimental and decorative, but in all other respects picturesque snares; so I set our village carpenter to work, and with the help of an old wheel he made us fifteen excellent new ones.

Then the village women joyfully came to learn the new art, which is indeed so old. What dreadful yarn we made at first! It twisted itself up into hard knots and loops. It was very strong certainly, strong enough to swing on—but how weave it? Then it suddenly drifted itself off into gossamer and spiders' webs. Meanwhile I had secured an old weaver, and for weeks his life became a burden to him. In all his sixty years he had never woven such dreadful stringy yarn. The result was practically a hideous material that looked like sacking and felt like a door-mat—great lumps and knots meandered about all over those thirty yards of linen: no two threads were alike, and my heart sank as I looked at it. But the fairies came again to our help, the dear homely fairies of soap and water, and their ethereal sisters of sun, dew, and air. In a few weeks they changed the rough stuff into soft white linen. The lumps remained, it is true; but had not the professor written that inequalities here and there were the honourable badge of all true hand work?

That is nearly six years ago, and now our little industry stands on a firm basis. One of the village women has learnt warping and winding, and we have about thirty spinsters. In one family the grandmother, the daughter, and granddaughter all spin for us. When a woman has learnt to spin, and can manage to produce a fair thread, I lend her a wheel and give her flax; and every month's end the thread is brought to St. Martin's, and there it is weighed and paid for. One of our best spinsters once spun fourteen bobbins in six days, representing an earning of about eight shillings a week. Sometimes when I drop into one of the neighbouring cottages I see the homely sight represented on another page, and I recall the epitaph the old Roman put up to his wife—that she was a good spinster, and stayed much at home.

The yarn when spun has to be sorted; the softer kinds are put aside for weft, and the stronger for warp. The former is wound on spools, as shown in the illustration; the latter is warped on a regular warping mill. The weaving itself is a complicated process, including beaming and knotting on. Our good old John appears to the life, sketched as he sits, pick in hand, throwing the shuttle. We now make seventeen different kinds of linen, good honest sheeting being our staple production—sheets that one can hand down with the family heirlooms to one's descendants.

WINDING ON SPOOLS.

Sometimes hypercritical visitors say it is manifestly coarse. Then I quote Sir Thomas More to them, where he says that in his Utopia fineness in linen was nothing accounted of—they aimed solely at durability.

We have never approached the wonderful old Egyptian linens, spun and woven by the simplest means three thousand years ago, but we have reproduced with absolute fidelity both as to colour and texture the Italian linens of the sixteenth century.

Great quantities of our linen are ordered for all kinds of art needlework, and church and decorative and household purposes. We now employ a staff of about fifty poor ladies embroidering carefully selected designs on our linen, and we have a ready market for all the beautiful things they produce.

We have spun and woven linen for the Queen, and only lately the Princess Louise sent a message to my Langdale spinsters, that she had spun at my wheel and considered herself one of us.

If any wise old-fashioned people want any of our hand-made linen, or care to know anything more about our little industry, let them write to me at The Crag, Ambleside.

ALBERT FLEMING.

# THE AUTHOR OF "UNCLE TOM'S CABIN."

MRS. STOWE, with the aid of her son, has written the story of her life.[1] Although not in the form of an autobiography, it is told for the most part in her own words, and she expresses her hope that it may lead those who read the book "to a firmer trust in God and a deeper sense of His fatherly goodness." "I can say," she adds, "with Valiant for Truth in the 'Pilgrim's Progress,' I am going to my Father's, and though with great difficulty I am got hither, yet now, I do not repent me of all the trouble I have been at to arrive where I am."

In more ways than one the narrative will be found attractive. It describes the domestic and pecuniary difficulties of a minister's wife, whose husband for many a long year was, as he said, "prodigious poor;" and it records the wonderful triumphs of a writer who, by the force of genius and a heart stirred to its inmost depths, carried the world by storm. There has not been in our century, perhaps, a more striking literary success than Mrs. Stowe achieved by "Uncle Tom's Cabin," but there are no signs that the author was unduly elated by her fame; and we shall be surprised if the reader of this pleasant volume does not close it with as warm an admiration for Mrs. Stowe as he has hitherto felt for her books.

Harriet Beecher was born June 14th, 1811, in Litchfield, Connecticut, where her father, Dr. Lyman Beecher, was well known as a Calvinistic divine. Her mother, who died four years after Harriet's birth, leaving behind her a large family, prayed that her sons might be ministers of Christ, and her prayers were answered, for all of them—six in number—devoted themselves to the ministry. From her earliest youth Harriet loved books, but there was little in her father's library likely to attract a child. A few, however, she did find, including a volume of the "Arabian Nights," and the little girl would secure a niche in the study, where, "with a kind of sheltered feeling," she heard her father writing, and speaking from time to time to himself in a loud whisper, while she lived in a happy world of her own. Harriet was very precocious, and had the good fortune (or misfortune) to write an essay at the age of twelve that was read aloud at the school exhibition before an "august assembly of visitors." The subject of the essay was "Can the immortality of the soul be proved by the light of Nature?" It is a remarkable composition for a child, but such a display of youthful logic was to be deplored rather than admired. It is pleasanter to read of the happy life led out of doors with her brothers in the woods, or when they went on fishing excursions.

The little girl had an elder sister name Catherine, a woman of remarkable ability, who fought many a hard battle with doubt and came out victorious. She kept a school in Hartford, Connecticut, and thither Harriet was sent with her head full of poetry and a dream of being a poet. She began to write a drama. "It filled my thoughts sleeping and waking. One day sister Catherine pounced down upon me and said that I must not waste my time writing poetry, but discipline my mind by the study of Butler's 'Analogy.'" Most of her father's sermons were as unintelligible to her, she relates, "as if he had spoken in Choctaw," but one day the good man, forgetting his "hair-splitting distinctions," talked of the love of Christ in the language of the heart. Harriet was deeply moved, and throwing herself into her father's arms told him all she felt.

"'Is it so?' he said, holding me silently to his heart as I felt the hot tears fall on my head; 'then has a new flower blossomed in the kingdom this day!'" There were spiritual conflicts afterwards, and times of darkness and distress, but her faith in God's love triumphed, and throughout a life by no means free from storms she has felt its sustaining power.

When her pupil days were over Harriet became a teacher. Her father having accepted an appointment as president of a theological seminary in Cincinnati, Catherine Beecher determined to start a female college there, with the younger sister as her assistant. And in the outskirts of this city, then considered the capital of the West, Harriet spent the next eighteen years of her life. There, in a debilitating climate, she suffered much from ill-health, there she made her earliest literary efforts, and there she became the wife of Professor Stowe, a man whose sole wealth was his learning. Harriet had to do everything and be everywhere, and as her nursery gradually filled with children there was a heavy tax on the young mother's resources. In a long letter to a friend she describes her domestic troubles with a good deal of humour. A short extract relating her difficulties in the early morning must suffice:

> "Up I jump, and up wakes baby. 'Now, little boy, be good, and let mother dress, because she is in a hurry.' I get my frock half on, and baby by that time has kicked himself down off his pillow and is crying and fisting the bedclothes in great order. I stop with one sleeve off and one on to settle matters with him. Having planted him bolt upright, and gone up and down the chamber barefoot to get pillows and blankets to prop him up, I finish putting my frock on and hurry down to satisfy myself by actual observation that the breakfast is in progress. Then back I come into the nursery, where, remembering that it is washing-day, and that there is a great deal of work to be done, I apply myself vigorously to sweeping, dusting, and the setting to rights so necessary where there are three little mischiefs always pulling down as fast as one can put up."

The "three little mischiefs," and a servant girl who required to be told everything, were impediments to the pursuit of literature; and a

[1] "Life of Harriet Beecher Stowe. Compiled from her Letters and Journals by her Son, Charles Edward Stowe." Sampson Low.

lady visitor describes a ludicrous scene in the kitchen, where Mrs. Stowe is trying to direct the cooking and to compose a tale at the same time. Sitting at the kitchen-table—which is covered with the materials for a pudding, about which, as well as the rest of the dinner, the "new help" asks questions every moment—behold the story-teller attempting to write a pathetic tale in which, while her heroine's whole frame "is shaken with convulsive sobs," the little maid interposes with questions as to whether she shall put the pork on the top of the beans and put ginger into the pumpkin!

A long wearisome time of ill-health, followed by utter prostration, led Mrs. Stowe to go with two of her sisters to a hydropathic establishment, and there she remained for ten months without seeing husband or children. A year later Mr. Stowe became ill, went to the same water cure, and remained there for fifteen months. Meanwhile cholera broke out in Cincinnati and swept away a large number of the people. From Mrs. Stowe's flock one lamb was taken. That sad autumn Professor Stowe obtained an appointment in Brunswick, Maine, and thither his wife was despatched in the first instance to prepare a home. She took her children with her, and might well write: "To come along such a distance, with the whole charge of children, accounts, and baggage, to push my way through hurrying crowds, looking out for trunks, and bargaining with hackmen, has been a very severe trial of my strength, to say nothing of the usual fatigues of travelling."

It was amidst difficulties innumerable, and at a time when the Fugitive Slave Act required people in the free States of America to assist in capturing escaped slaves, that Mrs. Stowe, moved to the depth of her being by the iniquity of that law, began to write "Uncle Tom's Cabin." "My heart," she afterwards said, "was bursting with the anguish excited by the cruelty and injustice our nation was showing to the slave, and praying God to let me do a little, and to cause my cry for them to be heard."

The success of the story was unparalleled in American literature. On the first day of publication in book-form (it appeared originally in a newspaper) three thousand copies were sold, and within a year three hundred thousand copies were purchased in America alone. Longfellow declared it to be one of the greatest triumphs recorded in literary history, to say nothing of the higher triumph of its moral effect. What that effect was it is difficult for Englishmen to estimate, but it made clear both to the Northern and Southern States that the time had come to settle for ever the slavery question; and it was the pressure of this question that led a few years later to the American Civil War.

"My heart warms to England," Mrs. Stowe had written, "as, *on the whole*, the strongest, greatest, and best nation on earth;" and now, after another change of residence—for Professor Stowe accepted an invitation to Andover, Mass., where, it may be said in passing, the new abode became "one of the pleasantest literary centres of the country"—Mrs. Stowe, with her husband and brother, set sail for Europe. Her fame had preceded her, not in the old country alone, but on the Continent, where twenty translations of the book quickly followed its first appearance. At this time Mrs. Stowe describes herself as "somewhat more than forty; about as thin and dry as a pinch of snuff; never very much to look at in my best days, and looking like a used-up article now." No modern author, with the exception perhaps of Sir Walter Scott, ever received such a welcome as greeted Mrs. Stowe in England and Scotland. Her journey through the country resembled the progress of a monarch. Stations were thronged and streets crowded by people eager to see the famous author, and often when driving on the roads the carriage was stopped by persons who came to offer flowers. And the highest ladies in the land, including the Queen herself, were glad to welcome the author of "Uncle Tom's Cabin." Some of them did more, and the Duchess of Sutherland, the Duchess of Argyll, and Lady Byron, among others, took her to their hearts, and became lifelong friends.

It is impossible in a brief paper to follow Mrs. Stowe through her wanderings and triumphs in England and on the Continent; impossible even to record her subsequent literary successes. A word or two, however, must be said about "Dred," her second great literary venture, because it is possible in the years to come that Mrs. Stowe's reputation will rest more securely on that story than on "Uncle Tom's Cabin." "Dred" did not, however, lack a welcome at the time of publication, and in England a hundred thousand copies were sold in four weeks. "Do you know," Harriet Martineau wrote, "I rather dreaded reading your book! Sick people *are* weak, and one of my chief weaknesses is dislike of novels (except some old ones which I almost know by heart). But oh! the delight I have had in 'Dred!' The genius carries all before it, and drowns everything in glorious pleasure." And she adds, "To say the plain truth, it seems to me so splendid a work of genius that nothing I can say can give you an idea of the intensity of admiration with which I read it."

One is not surprised to find Mrs. Stowe writing: "I am so happy, so blessed!" for the good she had effected by her writings was inestimable; but the "sweet peace that goodness bosoms over" was mingled with not a little sorrow. One loss after another tried her deeply, but she kept a brave and joyous heart notwithstanding, and many a happy hour was spent in her lovely winter home in Florida, surrounded by a luxuriance of vegetable life unknown in northern climes.

"The history of the cottage," she writes, "is this: I found a hut built close to a great live-oak, twenty-five feet in girth, and with over-arching boughs eighty feet up in the air, spreading like a firmament, and all swaying with mossy festoons. We began to live here, and gradually we improved the hut by lath, plaster, and paper. Then we threw out a wide verandah all round, for in these regions the verandah is the living-room of the house. Ours had to be built around the trunk of the tree, so that our cottage has a peculiar and original air, and seems as if it were half tree, or a something that had grown out of the tree. We added on parts, and have thrown out gables and chambers, as a tree throws out new branches, till our cottage is like nobody else's; and yet

we settle into it with real enjoyment. There are all sorts of queer little rooms in it, and we are accommodating at the present a family of seventeen souls. In front the beautiful grand St. John stretches five miles from shore to shore, and we watch the steamboats plying back and forth to the great world we are out of. On all sides large orange-trees, with their dense shade and ever-vivid green, shut out the sun, so that we can sit and walk and live in the open air."

Professor Stowe enjoyed this pleasant life as much as his wife. "My old rabbi, and I," she says, "here set up our tent, he with German and Greek and Hebrew, devouring all sorts of black-letter books; and I spinning ideal webs out of bits that he lets fall here and there." The Professor delighted in strange studies, and had the tastes of a mediæval mystic. His boyish experiences, told in his own words, form the most curious chapter in this volume. A few of them may be given without comment, for, indeed, what comment can be made on the "most singular delusion" under which he lived throughout his childhood? He states that from his infancy he was surrounded by a multitude of animated objects, which were always moving about him, but which he could not touch. He could see them passing through the floors and ceilings, and they excited no alarm, "except when they assumed some hideous and frightful form." The child regarded them as companions, and felt lonely in their absence, and he kept up a conversation with them "by a peculiar sort of spiritual communion." They exhibited all possible combinations of size, shape, and colour, but generally presented a shadowy outline of the human form. These friendly folk were not the boy's only visitors; there were also mischievous and terrible objects which appeared when he was out of health. They came in a sort of cloud, and scared the "rational phantoms," which is not surprising, since if the cloud touched them they melted into it without the possibility of escape. Every room the child occupied had a different set of phantoms—black spirits and white, blue spirits and grey; and there were sometimes visitants of another kind, and among them a very large Indian woman, and a small Indian man, who played on a bass-viol night after night, and then, springing upon a heap of straw, disappeared. Sometimes the visions were of a description frightful enough to deprive a child of reason; and on one bright moonlight night he awoke to find "a large full-length human skeleton of an ashy blue colour in bed with him." The child screamed with fright, and requested permission to occupy another bed, but would not tell the cause of his alarm. "For the remainder of the night I slept but little; but I saw upon the window-seats companies of little fairies, about six inches high, in white robes, gambolling and dancing with incessant merriment. Two of them, a male and female, rather taller than the rest, were dignified with a crown and sceptre. They took the kindest notice of me, smiled upon me with great benignity, and seemed to assure me of their protection."

It seems pretty clear from the boy's visions, and from his statement of how, without knowing why, he sometimes wished himself annihilated, and fell into uncontrollable passions, that his mind was trembling on the verge of insanity. It is significant that the spectres expressed pleasure or pain according to the mood of his mind, and that when they were most vivid his face became pale and his eyes "unusually sparkling and wild."

In her old age it is with no overwhelming feeling of regret that Mrs. Stowe reviews her past life, and counts up the losses that come to all of us as life advances. It was affecting to read old letters, telling of thoughts and feelings long since forgotten; "but I thank God," she writes, "there is one thing running through all of them from the time I was thirteen years old, and that is the intense, unwavering sense of Christ's educating, guiding presence and care." And writing to her brother about two years ago she says: "So my dear brother, let us keep good heart. No evil can befall us; sin alone is evil, and from that Christ will keep us. Our journey is *so* short! I feel about all things now as I do about the things that happen in an hotel after my trunk is packed to go home. I may be vexed and annoyed, but what of that? I am going home soon."

With these words we may fitly close this brief notice of a volume rich in interesting details. In some biographies we read about people without knowing them; in this narrative we seem to be brought as close to Mrs. Stowe as if we had lived in her house, and listened to her talk. Intercourse of this kind with a genial and gifted woman is delightful.

## Rye.

A LITTLE town that stands upon a hill,
Against whose base the white waves once leaped high;
Now spreading round it, even, green and still,
The placid pastures of the marshes lie.

The red-roofed houses and the grey church tower
Bear half asleep the sunshine and the rain;
They wait, so long have waited, for the hour
When the wild welcome sea shall come again.

The lovely lights across the marshes pass,
The dykes grow fair with blossom, reed, and sedge;
The patient beasts crop the long, cool green grass,
The willows shiver at the water's edge;

But the town sleeps, it will not wake for these.
The sea some day again will round it break,
Will surge across these leagues of pastoral peace,
And then the little town will laugh, and wake.

E. NESBIT.

# THE SOVEREIGNS OF EUROPE.

## THE KING OF DENMARK.

THE KING OF DENMARK.

*From a Photograph by the London Stereoscopic Company.*

WHEN, in 1863, Frederick VII of Denmark died without heirs, the throne of the "Goths and Vends" was assigned, with the consent of Europe and in accordance with the Treaty of London of 1852, to Duke Frederick Christian of Schleswig-Holstein-Sonderburg-Glücksburg. The "Protocol Prince," as he was derisively nicknamed, had married, in 1842, Princess Louise of Hesse-Cassel, whose mother had been a Danish Princess, sister of Christian VIII, the predecessor of King Frederick. It was, therefore, through his wife that the present King became entitled to the legitimate possession of the throne.

A troublous time it was for Denmark when Christian IX took its crown on his head, and he himself helped to make it yet more troublous, for on his accession he hesitated whether he should recognise the Constitution accorded to the people by his predecessor. This at once caused grave discontent, and when, further, he refused to sanction a property bill for Schleswig-Holstein, the exasperation of his subjects threatened him with a revolution; for the Danes to this day remain a turbulent people, and some "tumultuous processions," as they say at Copenhagen, soon showed the newly made King the temperament of the nation. He ceded and signed. But it was against the grain. Christian does not love constitutional forms, and would never of his own free-will have been a constitutional sovereign.

The King of Denmark's own views have, however, counted for little during his reign. He has been largely the victim of adverse circumstances. The first storm-cloud dispersed, he had, after eight months of rule, to meet a second and yet blacker one, for in 1864 broke out the war waged by Prussia and Austria against the helpless little kingdom, that was to be the commencement of Prussia's aggrandisement and Austria's Germanic eclipse.

The ostensible cause for fighting was the Schleswig-Holstein question; but little is known precisely as to what that question was. It is even more complicated than the Balkan one, which is saying a great deal; and it has caused as many rivers of blood and ink to flow. Lord Palmerston was in the habit of saying in the last years of his life—"There have never been but two men who really comprehended the question about the duchies: Prince Albert, who is dead, and I, who have forgotten it."

Roughly speaking, the whole was a drama in

three acts. Act I. The German Confederation, aided by Austria and Prussia, proposed to conquer the duchies. The Germanic Confederation was ousted, and Austria and Prussia undertook the war alone. Act II. The duchies conquered, the allies announced that they made over their possessions to the Duke of Augustenburg,[1] but the pretender soon found himself treated like the German Confederation. Act III, and last. Austria and Prussia fight among themselves for the spoils; and Sadowa ensuing, Austria, ousted from Germany, left the famous duchies in the hands of Prussia, where they remain to this day, although Prussia bound herself by treaty to restore to Denmark Northern Schleswig, which was nearly all old Danish crown land, if the population desired it. A quarter of a century has since passed, and the question has not even been put, nor will it ever be.

Hence before he had been upon the throne eight months King Christian had lost a third of his dominions, and was forced to sign a solemn treaty, ceding to his foes that which they had taken by main force. Thus Christian of Denmark was the first in Europe to pay tribute to the nascent German Empire. Since that day, and not without just cause, King Christian has renounced an international policy; but for all that no peace was to be his.

Ever since his accession the King may be said to have been in chronic feud with his Parliament, and ministerial crises seem perennial in the little kingdom. The fact is that the Danes are not an easy people to govern, and democratic ideas have considerable vogue in their dominion. Christian, on the other hand, is not a man of modern views. It would be difficult to find upon a European throne a person more upright, excellent, and loyal, or a more perfect gentleman in manners and education, but he was brought up in a petty Court, and attained a crown too late in life to enlarge his mental horizon. The King detests democratic ideas, and it is his pride to keep them in check.

Fortunately for himself personally he has had of late years in Herr J. P. S. Estrup a Prime Minister who, while conducting matters with a high hand, has no fear of the anger he excites, or the pistol shots to which he is exposed. This Danish Bismarck, who since 1875 has held office, is a consumptive little man who in a small frame possesses great energy—an energy that is, indeed, almost Bismarckian, though morally as well as physically he would be described as a pigmy when compared with his Teutonic model. The conflict in Denmark is also a miniature reproduction of that waged in the Prussian Diet before Sadowa, in which Bismarck supported his King. At Copenhagen, too, Crown and Parliament carry on a constant duel, in which up to the present the Crown has remained victor. But who can tell whether this will last? Indeed, in these progressive days, one may almost safely predict that it will not.

All these internal dissensions have contributed to make King Christian anything but a popular monarch, though at the same time his people, recognising his personal qualities, in the lapse of years have come to have for the man a sincere affection and sympathy. As a man he is universally beloved and esteemed; and when, in November, 1888, King Christian celebrated the twenty-fifth anniversary of his accession, it was regarded and treated as a *fête* of domestic rather than political sympathy. And truly for Christian IX may be reversed the saying of La Bruyère: "Il ne manque rien à un Roi que la douceur de la vie privée." The ease of public life has been lacking to the King of Denmark; all private happiness possible to man he has enjoyed to the full. A much tried sovereign, he has been and is the happiest of husbands and fathers; blameless and irreproachable in every respect. It was not derisively that the populace of Copenhagen sang beneath the Royal windows on a raw November evening of 1888 a popular ditty of which the refrain runs: "It is a fine family, that of King Christian."

To begin with, the King has been singularly fortunate in his consort. His wife is certainly a queen among women. Fifteen months his senior, Queen Louise has remained young of visage and form, although her hair is now sprinkled with grey. Well stricken in years (72), she looks at least fifteen years younger than she is. Nor has she only the charm of looks, but that also of intellect. Queen Louise has an exceptionally bright and quick intelligence, unusual powers of judgment, a highly gifted nature, and a heart of gold. Her graciousness of manner, her kindly looks win the hearts of all who come in contact with her. Her education, her mental gifts would have justified her in taking an active part in public affairs; and perchance she would have saved her husband much annoyance. But she has preferred to keep herself in the background, and has claimed instead to rule with all liberty in the royal home. And right wisely has she exerted her sway. That the Danish Royal Family is so united, that the Danish Court is the stock instance of the power of domestic virtue in politics, that few royal houses have made for their children alliances so brilliant, thrown out so many shoots all over Europe, is due to the Queen's goodness, energy, and wisdom.

There are certainly few ladies, even in private life, who at the Queen's age lead such a busy, active life as she does. An early riser, her days are fully occupied from morning to night, and she rarely allows herself an idle moment. And besides all her household and representative duties, the Queen keeps up an extensive correspondence, for the three married daughters and the absent son, King George of Greece, each expect to be kept *au courant* of all sorts of details concerning their much-loved Danish home, and no one can give them so well as "mamma."

The Queen is further devoted to painting and music, and does all in her power to encourage these arts, in both of which she is no mean proficient. She is perhaps most devoted to painting, admitting herself that, much as she loves music and enjoys playing—indeed, she is an untiring

[1] Father of the present Empress of Germany.

performer—she would always leave that to go and paint, while no one can persuade her to stop painting to go to the piano. More than one poor little village church in Denmark possesses an altar-piece specially painted for it by her Majesty, of which the inhabitants are duly proud, as will readily be understood. Of music the Queen has a most thorough knowledge. She is an appreciative and intelligent listener, for fortunately her deafness does not greatly hinder her enjoyment of musical sounds.[1] No concert in Copenhagen seems complete without the Queen's presence, and she seldom misses any. All foreign artists who come to Denmark, though they often complain that the Danish audience is a cold one, are delighted at the reception they meet with from the sovereign. One of her Majesty's greatest pleasures is to get a large bundle of new music, principally duets, and to try them over, for she has a wonderful gift for playing at sight.

In the days when the Royal couple were only two poor princelings their life was a most simple one, and many tales are told of how the Princesses, now Empresses and Queens Apparent, made and did up their dresses, and how the parents would drive out in one carriage, with all their six children squeezed into it. Their life was divided between Copenhagen, Jugenheim (near Darmstadt), and Frankfurt-on-Maine. At the two latter places Duke Christian—not then even nominated presumptive successor to the Danish Crown—eked out his slender income by giving drawing-lessons. No wonder, therefore, that his three little girls gave no credence to a gipsy who in those days foretold for them glorious destinies, promising to one a double crown of queen and empress, to another rule over a large empire, and to a third a queenly title without a kingdom.

But though devoid of luxury and splendour, there was still no happier, more patriarchal home in the length and breadth of Denmark. This is proved if only by the eagerness shown by all the absent children to come home—sure as they are, too, of always having a most hearty welcome from high and low, rich and poor. The King and Queen have no less than thirty-three grandchildren, all of whom, from the most grown-up to the youngest baby, are equally fond of both grandparents, and always enchanted to come to Denmark, where they enjoy a life of unlimited freedom. All the various English, Russian, Greek, and Danish cousins are the best of friends.

Bernstorff is the name of the favourite Royal summer residence, situated about a couple of miles from Copenhagen, on the outskirts of that most beautiful deer-park Dyshaus, of which all Danes are justly proud. The Queen is particularly fond of staying there, but when all the children and grandchildren are assembled together, as they have so frequently been during the last few years, then Bernstorff is too small to house them all, for it is not large. In consequence the Court moves yet further into the country to the Castle of Fredensborg, not far from Elsinore—that spot replete with memories of the ill-fated Prince Hamlet of Denmark.

No reminiscences of any importance are connected with the Castle, but the gardens were once celebrated all over Europe—that was in the days when stiffly-shaped trees and clipped hedges could make an impression. Now in the autumn months, when the beautiful Danish beech-woods are rendered doubly attractive by their changing tints and many-hued foliage, news from Fredensborg is eagerly looked for by all loyal subjects in England, Russia, and Greece, who follow with interest the movements of their respective royalties whilst away on their travels.

Many are the anecdotes told of those happy merry days at Fredensborg, where even the Emperor and Empress of Russia are able for a while to forget their cares and anxieties, and really enjoy a peaceful life free from hidden dangers. Very frequent, too, are the little expeditions to Copenhagen, when loyal Danes are delighted to see the Empress of Russia together with the Princess of Wales, and probably the King of Greece, going about quietly doing their own shopping, or catch a glimpse of the Emperor driving about in a cab with his three English nieces. He is a great walker, this Emperor, and, like his father-in-law, a keen sportsman; so that there are constant shooting-parties held at Fredensborg. King Christian is an admirable horseman, and rarely passes a day without riding and walking, too, is a favourite recreation. In the winter months it is quite common to meet the King in the streets of Copenhagen with no attendant save two collie dogs, one of which, the faithful Rover, was given to him when a puppy by Queen Victoria.

No one can be fonder of a romp with the little ones than the King, and stories are told of how at Fredensborg his Majesty has been seen seated in a very diminutive pony-carriage, trusting himself to the care of a very youthful coachman. Another time he was himself the willing horse for a still younger driver. It is wonderful how at his age he has kept his freshness and elasticity. After dinner it is he who invites his grandchildren to perform gymnastics, and sets them the example. He has a great opinion of the value of physical exercises of all kinds.

When the family are assembled together the Queen always takes advantage of having her daughters with her to perform music in common. It is not rare for them to play eight hands on two pianos—the Queen and Duchess of Cumberland at one, the Empress of Russia and the Princess of Wales at the other. She has great moral influence over these daughters, but is also careful not to bias them in any way in the discharge of the particular duties required by their respective exalted stations.

As a rule their majesties spend Christmas at Fredensborg, and early in January the Court moves into Copenhagen. From then till the King's birthday (April 8th) is the so called season in the Danish capital. When in town the Royal couple go constantly to the theatre. In fact

[1] The Princess of Wales unfortunately inherits her mother's deafness, but like her mother, makes up for weakness in the ears by exceptional quickness of eye.

hardly an evening passes when the King does not look in for an hour or so. There is but one really first-class theatre in Copenhagen, the Royal; but whenever there is anything considered worth seeing at any of the other houses, the Court always goes.

The hours are early. The Opera begins at seven o'clock and most concerts at half-past seven. The Court dinner is at half-past five, and it used to be as early as five o'clock. The hour for luncheon is one o'clock, and this meal is always quite unceremonious, no ladies or gentlemen being in waiting, only the now much reduced family party, consisting of the King and Queen, and the King's two brothers, the Princes Wilhelm and Hans of Glücksburg.

The windows of the luncheon room look out on to the open square, or rather octagon shaped "Plads," on which the four palaces of Amalienburg stand; and every day during the severe weather of last winter the King and Queen invariably collected all that remained on the table after lunch was over, and, making up a large newspaper parcel, passed it through the window to the poor workhouse men who were always there sweeping up the perpetual snow.

Very often, just as lunch is over, some of the Crown Prince's children come over to pay a hurried visit to their grandparents before going back to lessons or to their daily walk or drive.

The dinner, of course, is an affair of more stiffness and etiquette, as the maids of honour (of whom the Queen has three, and who live in the palace), the master of ceremonies, the King's adjutants, and the officers on duty of the guard all dine at the same table as their majesties. After dinner, if there is no theatre that evening, they all retire to their respective rooms, and reassemble at nine o'clock for tea, when the rest of the evening is spent in card-playing. The King, as a rule, has a rubber of whist, and the rest of the party play a round game.

Prince Waldemar, the "Sailor Prince," and the youngest of the family, lives in the so-called Gule Palæ (Yellow Palace), the same in which his parents lived before they were King and Queen, and where all their children, with this last exception, were born.

Prince Waldemar is united to Princess Marie of Orleans, daughter of the Duc de Chartres. It is worth mentioning that this couple were married quite simply, without any ceremony, by the Maire of the Parisian arrondissement where the Princess lived. They have two sons, the eldest of whom, little Prince George, not yet two years old, is the Queen's favourite companion in her daily drives.

The remaining five children of the Royal couple are Frederick Christian, Crown Prince, born in 1843, and married to Princess Louise of Sweden, only daughter of the late King Charles XV; Alexandra, who was married to the Prince of Wales some months ere her father ascended his throne; William George, King of the Hellenes, married to the charming Grand Duchess Olga of Russia; Dagmar, now reigning Empress of Russia; and Thyra, married to the Duke of Cumberland, King of Hanover *in spe*. The latter Princess, after giving birth to five children, was for some years the victim of a nervous malady that affected her reason. Happily the crisis has passed, and the Castle of Gmünden, where the princely couple reside, has resumed its wonted animation.

Crown Prince Frederick, who is already forty-five years of age, has seven children. He is a model father of a family, and an excellent type of heir-apparent—studious, eloquent, amiable, rich, open-handed, and yet not extravagant. His wife, eight years his junior, is remarkable for her quick wittedness, and intelligence. On her first advent at the quiet Danish Court she shocked it a little by her mode of dressing, and her freedom of manners, but she has now toned down, and fitted herself into the simple burgher old-world *milieu*.

The residence of the Crown Prince is opposite the King's, and the two remaining palaces occupy the other side of the "Plads." One of these, which was formerly the residence of the Queen Dowager, is now given up to the Ministry for Foreign Affairs, while the fourth, connected by a covered colonnade with the King's palace, is principally used for any festivities at Court, for since the burning of the Christiansborg Castle in 1884, where there were such magnificent halls and reception-rooms, they have been rather at a loss for sufficient room to receive all the invited guests on any great occasions. On the ground-floor of this fourth palace the Queen's sister, Princess Augusta of Hesse, has her winter apartments.

The Danish Civil List is not rich, especially since the loss of the duchies. All included, it scarcely amounts to two million francs. Nevertheless the Royal couple are most liberal. The Queen in especial takes a lively and personal interest in all charitable institutions existing in the realm, and above all in asylums or hospitals for children, as she is essentially a children's friend. Kind and thoughtful to a degree, always ready with generous and judicious help whenever it is needed, never forgetting a good armful of toys when she goes to visit the little patients, the children naturally feel they have a loving friend and helper in their Queen.

Such, then, is this Danish royal family, and if the Danes—or at least a majority among them—are not satisfied with their King as ruler, they are enchanted with him as burgher, as father-in-law, and father. As for their Queen, they simply worship her. Strangers who come to Copenhagen, and who have the privilege of entry at Court, can indeed say with all loyal Danes—who are justly proud not only of their King and Queen, but of the many powerful connections gained for the country by the various marriages made by their children—that the Danish Royal Family is indeed an exceptional one.

# A FORGOTTEN GREAT ENGLISHMAN.

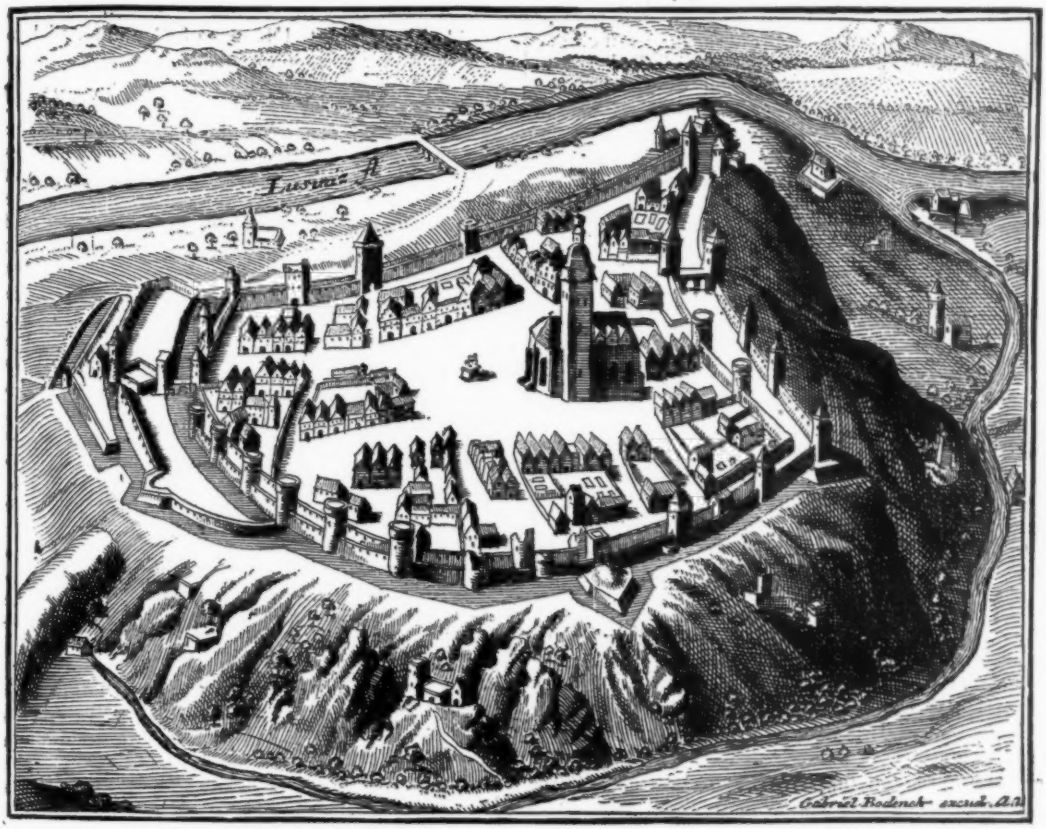
BY JAMES BAKER, F.R.G.S., AUTHOR OF "JOHN WESTACOTT," "BY THE WESTERN SEA," ETC., ETC.

I.

SHALL we prove the above title to be a misnomer? To be great, and yet to be forgotten by one's own countrymen; to have swayed the minds of men at one of the greatest periods in the world's history; to have led the rulers of that period, and made Popes and Emperors await the words that decide a nation's fate; to have been first and foremost in debates that still re-echo through the world, though nearly five hundred years have elapsed since the actors in these scenes have passed away from earth—and yet to be forgotten!

No English history, no biographical dictionary, no encyclopædia contains the name of the subject of this article; and yet he is remembered lovingly by the country that adopted him, and whose cause he so boldly fought for in their mighty portentous struggle against Europe. But if in England this great man is forgotten, in Bohemia his name is cherished; and her historians give him ample space, and her people of to-day know his name. If in the fifteenth century the Bohemians ransomed him at a high rate of ransom when taken prisoner, so now in this nineteenth century her historians have fully and ably rescued his name from the oblivion to which English historians would have condemned it, if we can say men condemn that which they ignore. The plain name of Peter Payne will ever shine forth as a bright star in Bohemian history; and our aim is to prove that the writers of English history cannot ignore him if they would set before the world the work of the English people, and their onward course, for Peter Payne desperately, strenuously, and persistently cherished the seed which burst forth into much flower and fruit ere his own century had set.

He is, and was, one of the greatest of the leaders of the Wiclifites (known to us English as Hussites) of Bohemia through all the fierce years from 1417 until the year 1452. In 1415 he was Vice-Principal of St. Edmund's Hall in Oxford, but he was driven thence, against the will of the King, Harry of Monmouth, because of his intense earnestness and persistency in spreading the teaching of his master, John Wiclif; and on the 13th February, 1417, he was received amongst the Professors of the Prague University. The first important mention we have of his name is where it occurs in a list of the men who in the year 1420 were held in high esteem in Prague; and here he is spoken of as the Englishman Peter Payne, "who is generally spoken of as Meister Englisch." Five years had elapsed since Huss had died for his adherence to Wiclif's teaching, and already his followers were beginning to break up into those sects that so weakened the unity of Bohemia. A year before the strange town of Tabor had been founded by the troops of people who streamed out to this tent bedecked, water-surrounded height to worship God in their own fashion under the free heavens, and it was in the controversies between the Praguers and the Taborites that Payne's name first came prominently forth as a peacemaker between the controversialists. The Taborites had drawn up certain propositions upon the fourth of the famous Prague Articles, upon the frequenting taverns, extravagance in dress, deceptions in work and trade; and these the new town of Prague had agreed with, but the old town wavered in their decision, not being willing to adopt the reading of the Taborites; but their leaders went to Peter Payne, and after they had been instructed by him they fell in with their fellow-townsmen, and, with some qualifications, and under certain conditions, were one with the Taborites.



This first action of Payne's gives us the key to his work in Bohemia. It was generally that of a peacemaker and arbitrator, and though we shall find him standing up boldly before Council and Pope and Emperor, holding forth and expounding with fiery words the teaching of his master, Wiclif, yet generally he is the mediator between the passionate fighting sects of the Bohemians.

The teaching of the Taborites was similar to the dream of honest revolutionists in all ages—those of 1789 and 1848—and of some few Socialists of the present day. There was to be no king or over-lord: all were to be brothers and sisters. "In Tabor," ran their first article, "there is no mine and thine, all is in common; and so it ever shall be—all in common, and no personal property. Whoever holds such shall commit a deadly sin." But in Tabor, as in later years, this impossible dream of a universal brotherhood soon vanished, and the laws of Mine and Thine were re-established.

This first public action of Payne's was in the year 1420, and between this and the next time we hear of him, on the 14th of November, 1421, was a time of terror and tumult, and of the fiercest bloodshed in Bohemia: King Sigmund fleeing, and then promising all that is demanded of him, earning his title of the "word-breaker," and leaving his land to be torn by furious sects, who committed fearful horrors in religion's name. In Prague the quarrel was developing into a class-war of Democracy against Aristocracy, the former being led by Priester Johann, formerly a monk of Selaw; and it was as a mediator between this Priester Johann and the magistrates of Prague, upon certain points laid down for the more peaceable ordering of the town, that we find Peter Payne again chosen.

Between this mention of his name and any

further record of his life five fiery bloody years pass over Bohemia. Ziska, with his waggon-forts, marched and countermarched against Sigmund with a rapidity that astonished his contemporaries, but with such attendant horrors that after his victory at Deutch-Brod his remorse for the deeds of cruelty was so great that it clung to him until his death. But Ziska was dead, and the great victory of the Hussites at Aussig over the Germans had been won ere we hear of Payne in the presence of Prince Koryhut upholding Wiclif's doctrines. A reaction had set in in Prague against the teaching

TABOR, FROM AN OLD ENGRAVING OBTAINED BY THE AUTHOR FROM THE TOWN CLERK OF TABOR.

of Wiclif and his follower Huss, and the priests and doctors of that town now taught that the Communion should truly be taken both in bread and wine by the laity, but that many other of the doctrines of Wiclif were heretical, or at least mischievous and errorful. And M. Pribram, who is described as "the most miserable of sinners, but a warm denouncer of heresy, and especially of Wiclifism and Picardism," commenced in such hot terms to inveigh against these errors that the followers of Wiclif began to fear that if Wiclif be declared heretical, Huss, his follower, must also be arraigned under the same category. And to oppose the fiery denunciations of M. Pribram a discussion was arranged in the university, and Peter Payne was chosen to oppose M. Pribram, "for he had ever defended and taught most ardently and thoroughly the views of his famous countryman." The fiercest struggle was, as usual, upon the point of the Transubstantiation; and the importance of the task thus set Payne is made clear by the Bohemian historian's following sentence: "If," he writes, "matters had gone according to M. Pribram, the Chalicers, out of pure opposition to Wiclifism and the bolder Hussites, would have been drawn even nearer to Rome, and would soon have found themselves again in the bosom of the Catholic Church, and all their former sufferings and struggles would have been but strayings from the right way and as but an injurious dream." And so the moment was come when a decision must be made whether Hussitism (ignoring the sects of Taborites and Orphans) should have a self-existence, and become an organic development in the inner life of the future.

As this discussion led up to an important step in Payne's life, we must briefly follow the events of the next year, although his name is not mentioned in them; but the fact of his sustaining the weight of the defence, and his after action, proves that he must have been in the whole heat and turmoil of the events.

Prince Koryhut, thinking that M. Pribram's party outnumbered Payne's, as we may term it, quickened the decision, but not to his own advantage. He sent a private messenger to Pope

Martin, writing that the Bohemians were ready to fall into the Church's arms if but the Pope would himself hear them. The Pope was only willing to listen to them if they unreservedly bowed to the Church's teaching and did not come to wrangle and argue upon various points; and he appointed King Wladislaw and Prince Witold as their intercessors. But the Hussites, as the victors, did not care to become pleaders to the defeated power, and even the moderate Chalicers objected to such an action. These now had as their leader M. Johann Rokycana, a man of poor parentage, but of great power, and preacher in the Marien-Tein Church. Many others amidst the moderate party, with priests, doctors, and burghers, and even close adherents of the Prince, objected with Rokycana to this approaching of Rome; and when at length this preacher, on the 17th of April, 1427, made publicly known the truth of the letter of the Prince, one of those scenes occurred with which Prague in those days was so familiar. The bearers of the Prince's letter had been captured during the night. The words of an old song, which may be translated as follows, quaintly recite the scene:

> "They rode out of Prague as night began,
> Well knowing what Koryhut secretly span;
> But when they rode back from their ride of night,
> They brought all the rogues in the full daylight.
> They bid ring the bells from the towers on high,
> And the folk all flocked to the Tein hard by.
> Not long did the priests in the church there stay,
> But streamed to the Ring in the light of day;
> And they cried aloud, with fearful cries,
> 'Belov'd, we're threaten'd! To arms, arise.
> And the streaming folk then quickly knew
> With treacherous letters they had to do."

The bells did ring forth, and the people, armed, swarmed in street and square, crying out "Treason!" Two men of the court, at the head of an armed troop, possessed themselves of the prince, and at night carried him to the castle. Many of the doctors, Pribram amongst them, were imprisoned in the Rathhouse, and so, without at least bloodshed, Rokycana's party gained the upper hand; and after Easter the prince was taken to one of the wildest castles in all Bohemia, a castle the only entrance to which was, and is, between two narrow walls of rock pierced for shooters, and at this castle, Waldstein, so secretly was he kept, that his faithful followers, amongst whom was the owner of the castle, did not know where he was.

When quiet was restored articles were drawn up to preserve peace and unity, declaring how and what should be believed, and what rules and ordinances in the Christian's observances should be obeyed; and these articles give the difference between the true Chalicers and Rome, and also in what they differ from the Taborites and Orphans. The articles upon the Transubstantiation, upon which Payne felt and spoke so strongly, ran thus: "The visible altar sacrament that Christ Himself, His Apostles, and other saints in truth call 'bread,' is in a miraculous and secret manner before the eyes of our mind and understanding the true body of our Lord Jesus Christ as He received it from the Virgin Mary, died upon the cross, rose again from the dead, and sitteth on the right hand of God." This was to be simply believed; and no new interpretation was to be sought for or accepted. This article was directed not only against the Taborites, but most especially against Peter Payne, so writes the Bohemian chronicler; and thus it happened that this "talented foreigner" separated from the Praguers, joined himself first of all to the followers of Ziska, called the "Orphans," and afterwards to the Taborites, becoming one of their most noteworthy teachers.

To stay the dreaded power that now seemed to threaten all Europe, Pope Martin v strove to induce a new crusade against the Bohemians, and, to aid this, appointed Henry of Beaufort, Bishop of Winchester (whom he had especially raised to the Cardinalate as a strength against Hussitism), as Legate of the Apostolic Chair for Bohemia, Hungary, and Germany. "His name," ran the mandate, "the name of a kingly and victorious race, would so much the more set the enemies of the Church in fear, as his fame was remarkable for the highest virtues, wisdom, experience, and knowledge." Thus we have the strange fact that an Englishman, Cardinal and Bishop, with all Europe and the power of Rome at his back, is appointed by the Pope to arouse a crusade to destroy that which in every critical moment was being vigorously sustained and advanced by that other Englishman, plain Peter Payne, the defender of the teaching of Wiclif.

Mighty indeed now were the efforts made to crush finally this tiny land, whose sturdy, vigorous, and heroic enthusiasts defied all Europe.

A new order of knighthood, that of St. George, was instituted, the members binding themselves especially to combat the Godless heretics of Bohemia. In Germany all feud was to be laid aside, and all countries—Holland and Alsace, Suabia and Switzerland, France, Saxony, Pomerania, and Austria all joined in raising armies to defeat finally this heretical force.

Cardinal Henry of England came at the head of a thousand Englishmen to aid in that defeat, to crush and slaughter the Wiclifites of Bohemia, as the Lollards had been crushed in England. Their own weapons were to be used against them, for waggon-forts were to be with each army.

But the supreme danger had united Bohemia, as it ever did. Praguers, Taborites, and Orphans combined; but their whole force against this mighty host was not fourteen thousand footmen and fifteen hundred horse, with waggons and guns; but, with Priester Prokop at their head, Cardinal Henry joined the crusading host only to meet the first fugitives, and his rage at their cowardice was intense. He placed himself, with the Papal banner unfurled, at the head of the few who heeded him, and, crucifix in hand, stayed the flight, but only for two days. The whole host of crusaders formed once more in battle array at Sachaw, and the princes and leaders swore an oath that they would stand by each other, but the approach of the Bohemian army scattered their firm resolves, and even at the commencement of the fight fleeing bodies of men threw the whole army into disorder. All prayers and

threats of the Cardinal Bishop of Winchester were useless. Useless his mighty rage, and his seizing the Imperial banner and tearing it, and with fearful curses trampling it beneath his feet. Terror of the dreaded waggon-forts and the mighty heretics who manned them alone possessed the whole hosts; and Henry of Winchester must needs fly himself or fall into their hands.

And thus ended for the time this other great Englishman's attempt to enter Bohemia by force of arms. He wrote of the defeat that it was caused by the absence of good tactics and organisation on the part of the crusaders. It was not the number of troops that were required, but war-hardened and war-practised warriors, as were the Bohemians themselves; and he suggested that levies in future should be directed to the sustaining of armies of such men, to combat this terrible foe. And so an income-tax was imposed upon all over fifteen years of age, and with this tax a mighty host of trained inured soldiers was to be raised, to be upon the borders of Bohemia on St. John's Day, 1428. The appointed leaders of the yet further crusade were Cardinal Legate Henry of Winchester, and the Margrave Frederick of Brandenburg. Pope Martin wrote to his newly appointed English Legate, "Thou art truly the man we took thee for, since thou hast shown so much courage and foresight," a lengthy and flattering letter, and he also issued a bull commanding that the yearly tithes should be devoted to the raising of this army. But in another matter he and his Legate went counter to one another; for whilst the Pope in his bull described all Hussites as Adamites (a strange sect whose religion ofttimes developed into orgies of lust, and who took the sacrament naked in the open air; a sect living and hiding themselves in forests and valleys), and commanded that no disputations should be held with them, for the Church required no further testimony of its truth, yet Cardinal Henry had instituted a disputation to try and convince the Bohemians of their errors.

This discussion took place in the castle of Zebrak; and we find our forgotten Englishman's influence has been ever silently working, for, with Master Johann, of Rokycana, he is chosen to defend the tenets and faith of the Bohemians,

This conflict of these two Englishmen, the one with the whole power of Europe behind him, with church and sword, the other with but his power of mind and ardent soul, is strangely remarkable. Of Payne's action of body we have but little; it is whenever mind and soulful sustaining is required that the Chalicers immediately fly to him. That he was ofttimes in extreme danger we can glean, but in fighting he does not seem to have joined, as did so many of the priests and doctors of the time. This disputation led to no convincing of the Bohemians by the Romish delegates of their error, neither does it seem to have welded more closely together Praguers, Taborites, and Orphans. M. Pribram, Payne's old opponent, treats of this disputation in a tractate, but only in a passing manner.

Whilst the theologians were discussing, the Bohemian armies of each sect were marching triumphantly; and until the spring of 1429 went on intermittently this work of fighting and bloody retaliation, until Herr Meinhard, of Neuhaus, a leader of the nobles, but the son of an ardent Wiclifite, took the opportunity of King Sigmund being at Presburg to arrange a meeting between King and the religious leaders of the Hussites. Priester Prokop, as leader both in religion and war, stands first of those chosen to meet the King, but next comes the name of Peter Payne; and these two, with other delegates and some two hundred horsemen, make their way from Bohemia over the mountains, and down the Danube flood to Royal Presburg. Prokop, knowing well he had to do with Sigmund, the "Wordbreaker," taking care to have a safe conduct from him, made sure by the persons of two princely hostages and other nobles.

At Presburg were assembled the chief representatives of all the opposing parties, one of the chief of the King's party being Ulrich of Rosenberg, who played so important a rôle in Bohemia's history in the coming years. He held the castles and territory now owned by Prince Schwarzenberg. Germany also sent bishops and doctors to uphold her views of the questions in discussion, and from Paris also came four learned doctors.

The disputation lasted until the 9th of April; and Sigmund, ever bending to the ascendant of the moment, was gracious and friendly to the Hussites. He spoke of his kingly right, and of his inborn love to Bohemia, and begged them to quit their new ideas and tumult, and to return to the faith of their fathers. If, however, they would not do this, then let there be a truce, until two years hence a general council of the whole Christian Church would be assembled at Basle, and before this council they could lay their articles and submit themselves to this supreme judge in matters of faith; until then let there be a truce between them and all Christian countries.

The answer to this mild speech of Sigmund's was such as Payne ever gave to the soft conciliatory words which would lead the Hussites from the faith of Wiclif. Palacky does not say the words are Payne's, but the thought is certainly his. "It was not they (the Bohemians) who had departed from the old true Christian faith, but their opponents; and there could be no peace until the Church returned from all its false ways again to the teaching of Christ and His apostles. As to the coming council, if it resembled Constance, to that they could not submit themselves, as there their bitterest enemies enounced the law; and it would be madness to appear before their enemies' judgment-seat. Therefore there must be a higher and non-partisan judge between the council and themselves; that judge should be the Holy Scriptures and the law of God, and the writings of those learned men who steadfastly had built their work upon that law."

This sharp difference even the flattering words of Sigmund could not smooth away, and at length the Bohemians drove him from his diplomatic gentleness. They had addressed him as King, but not of Bohemia—as King of Hungary and Rome. This he bore silently, but they informed him that would he change his faith they would receive him

more gladly than any other in the world, and aid him against all his enemies. This was too much for even Sigmund's pliability, and he burst forth, and swore by God and all present, he would rather die than change his faith. The congress ended in the deputies stating they had not the full power to act in the name of the nation, and a Landtag being called in Prague for the 23rd of May, at which Sigmund's ambassadors were to be present.

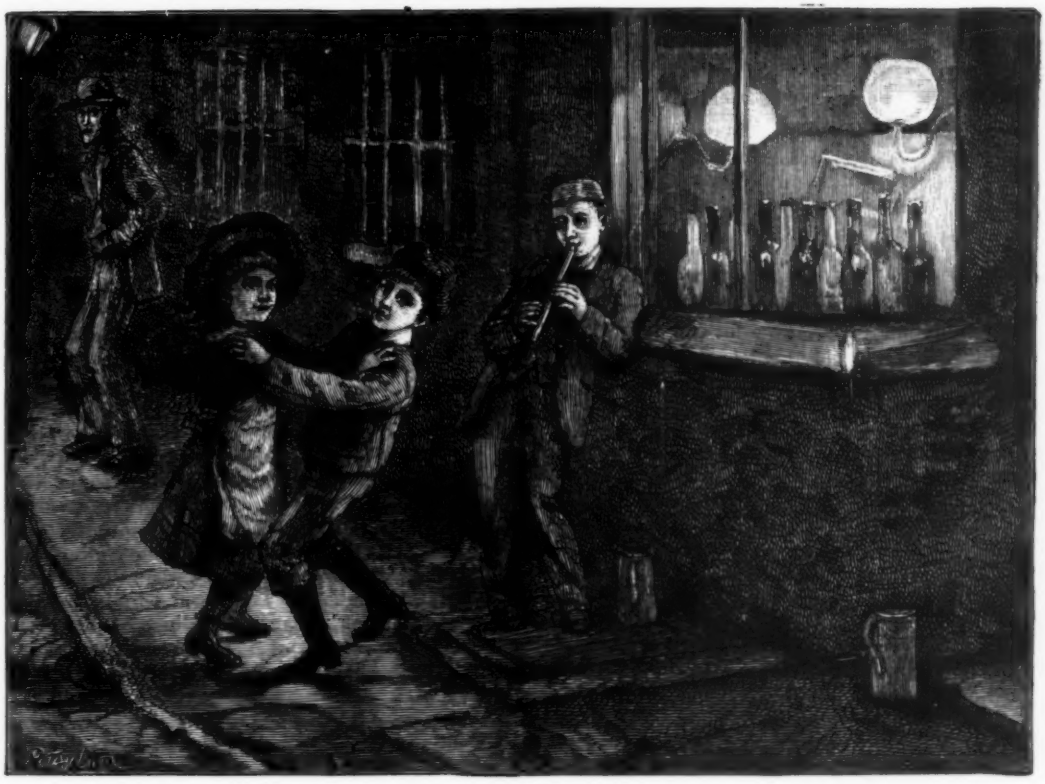
And thus we can picture Rokycana and Payne and the other deputies again wending their way over the hills and passes of Bohemia, back into the plain-lands around Prague, and being received with anxious hearts and questionings as they came in sight of the high fortress-walled rock of the Wyscherad, that had witnessed so much bloodshed and such fearful horrors for the right of free conscience and the tenets of their English leader Wiclif.

The Landtag was held and certain conditions laid down by the Bohemians for the time, and also for the conduct of the council; amongst others that, to be a "general council," it was necessary that the Greeks and Armenians, and all who received both bread and wine in the Sacrament, should be present. The Taborites also laid before the king their own six points for a reconciliation, but without issue.

Sigmund had not waited for these conditions, but had supported the Pope in bidding a new crusade against Bohemia to be proceeded with; and again we have that other Englishman, Henry of Winchester, hastening with energy to suppress once for all Wiclif's growing power in Europe. Not a thousand, but five thousand, fighting Englishmen he had now with him wherewith to stay the timid Germans from fleeing from the waggon-forts of the Chalicers, and what effect these five thousand English crusaders might have had upon the history of Europe and the foundations of the Reformation cannot be told, for at this moment had uprisen in France a religious enthusiast whose presence had aroused her countrymen to feel that even the English were not indomitable; and Henry of Winchester and his five thousand fighting-men were hastily called upon to give up their crusade against the Wiclifites and to march to France to aid their countrymen, who were fleeing before the Maid of Orleans. Unwillingly by the Cardinal, readily by his men, was this call obeyed, and the Germans quickly seized upon his absence to give up the crusade; and thus was it that the defeat of the English in France by Joan of Arc aided the onward progress of Peter Payne in Bohemia in his fervent, assiduous teaching and upholding of Wiclif's faith. And thus "the Maid" was aiding that mightier movement that was to sweep away for ever the universal power of that Church of which she was so devoted a follower.

How powerfully her work then tended in favour of the Romish Church may be gathered from the fact that a letter was circulated amongst the Bohemians threatening them with the wrath of God "and the Maid" unless they quickly and fully returned to their obedience to the Church.

Whilst these events were agitating Europe the town of Prague was by no means at peace. As usual, when at truce with their foreign foes the Bohemians strove amidst themselves; the old and the new town were ever rivals; and, heal their quarrels as they would, there was no real unity so long as the different religious divisions were at variance. M. Johann Pribram, the great opponent of Wiclif, was again at liberty, and was renewing his ardent opposition to his teachings. "And as Mr. Peter Payne, the countryman and chief pupil of Wiclif, never ceased to defend his master with courage and keenness and penetration," it was determined to hold a disputation between the two, each being supported by four of their most important men.



The ordering of this debate is a great proof of the high esteem in which Payne was held (though of that we shall have greater proof), and if further at the moment is wanted, the names of the men who supported him give it. The four were the chief leader, M. Johann, of Rokycana; Priest Wenzel, of Drachow; Priest Peter Nemec, of Saaz; and Niklas, of Pilgram, Bishop of the Taborites, the latter name being a sign that Payne was now in fellowship with the Taborites.

For three weeks this debate lasted. Pribram strove before all to deny any unity between Huss and Wiclif, and chose two hundred passages from his writings that were heretical, errorful, or at least vexatious. Payne won great praise by the acuteness with which he handled these passages, and proved them to be true and Christian teachings; but when the discussion turned upon the question of the Transubstantiation two of his followers left him to agree with Pribram, Rokycana, and Dracow; but Payne was successful in proving error in many of Pribram's statements; and the outcome of the debate was rather a truce than a reconciliation. None of those concerned in the debates were to be denounced as heretics whether the dead or living; Wiclif or Huss, Jacobellus, or Payne, or Pribram, and the words of either were not to be made public save in Latin.

But Pribram could not adhere to this, and quickly denounced Wiclif and Payne, and all the Taborite party as heretics, and this in Bohemian; and the Taborites responded, at a conference held in Tabor from the 6th to the 13th of January, 1430, by a strong command to all their followers that no priest of Pribram's party should be suffered amongst them.

From this date until the next mention of Payne's name two years elapse, and the teaching of Wiclif was, through the adherence of Huss and his followers, and the firm and steadfast upholding of it by his ardent pupil Peter Payne, spreading and taking root in Europe, especially in Germany and France, and even in Spain, many began to waver and be unsettled in their faith. The Hussites were most earnest against the misuse of worldly power by the priesthood, and against the heavy rule of the nobles over the common folk; and their ever-continuous and unbroken victories made many ask whether God was not with them, and their cause just. Thus silently the way was being prepared for the later reformers, Luther and his followers.

# Street Dancers.

SINGING in this London street,
To the rhythm of their feet,
By a window's feeble light
Are two ragged children bright—
Larger sparrows of the town,
Nested 'mong the vapours brown.
Far away the starry mirth
Hangs o'er all the wooded earth.

If these merry ones should know,
Footing in the feeble glow,
Of a wide wood's starry leisure,
Would they foot so fleet a measure?
Ah no!

Maybe now in some far lane,
Dancing on the moon's broad stain,
Watched of placid poplar-trees
Children sing in twos and threes.
Hush! hush! hush! On every lip
Lies a chilly finger tip,
As there floats from fields afar
Clamour of the lone nightjar.

If these merry ones should know,
Footing in the feeble glow,
Other people's mirth and pleasure,
Would they foot so fleet a measure?
Ah no!

Maybe in some isle of isles,
In the South Sea's azure miles,
Dance the savage children small,
Singing to their light footfall.
Hush! hush! hush! they pause and point
Where a shell the seas anoint,
Dropping liquid rainbow light,
Rolls along the sea sands white.

If these merry ones should know,
Footing in the feeble glow,
Other people's mirth and pleasure,
Would they foot so fleet a measure?
Ah no!

Maybe now a Bedouin's brood,
Laughing goes in wildest mood,
Past the spears and palm-stems dry,
Past the camel's dreaming eye.
Hush! hush! hush! they pause them where
Bows the Bedouin's whitening hair—
Peace of youth and peace of age,
Thoughtless joy and sorrow sage.

If these merry ones should know,
Dancing in the feeble glow,
Other people's mirth and pleasure,
Would they foot so fleet a measure?
Ah no!

Others know the healing earth,
Others know the starry mirth;
They will wrap them in the shroud,
Sorrow-worn, yet placid-browed.

London streets have heritage,
Blinder sorrows, harder wage—
Sordid sorrows of the mart,
Sorrows sapping brain and heart.

If these merry ones should know,
Footing in the feeble glow,
Of the healing earth May-treasure,
Would they foot so fleet a measure?
Ah no!

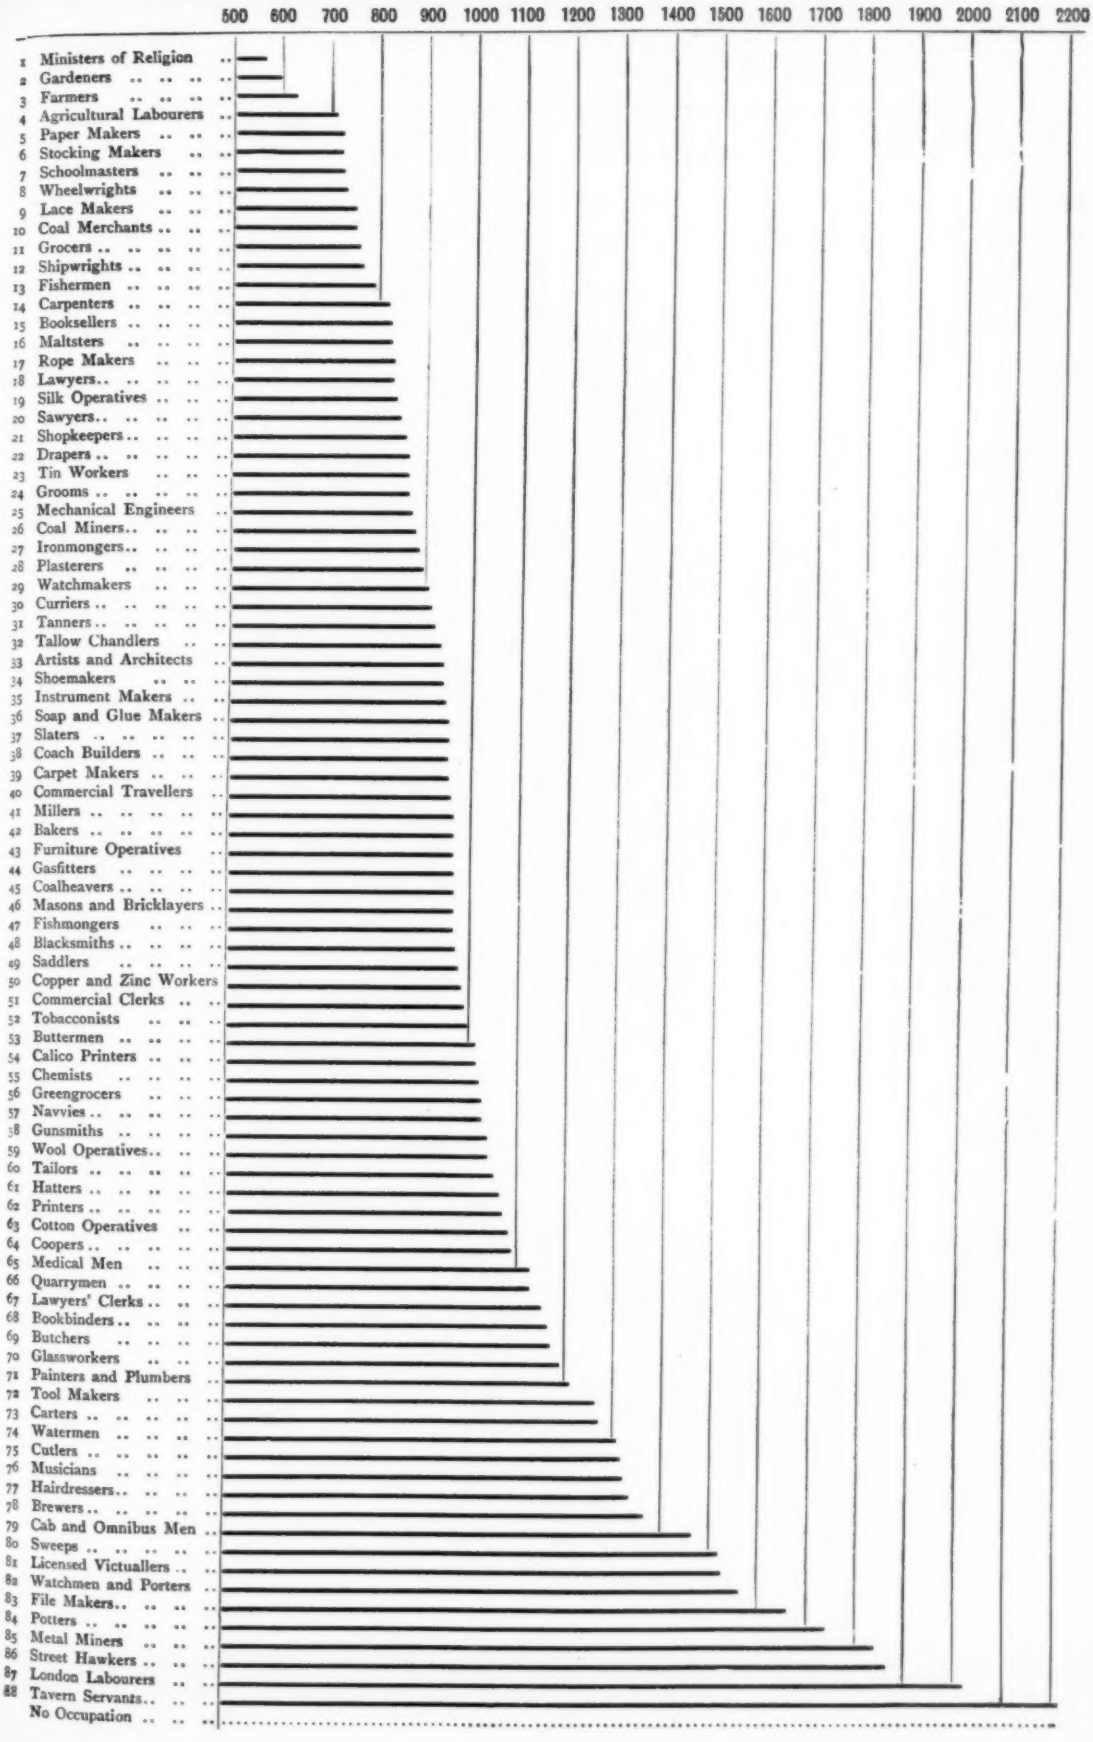
W. B. YEATS.

## OCCUPATIONAL MORTALITY.

A TABLE of mortality that has the minister of religion at the top and the tavern servant at the bottom is likely to be looked upon as quite ideal by a large number of our readers, and perhaps thought by some of them to be rather too good to be true. There is, however, no reason to doubt that on this occasion the statistics give a fair statement of fact, for, although many qualifying circumstances have to be taken into consideration, the general result remains unaltered.

Every ten years the Registrar-General of Births, Deaths, and Marriages publishes a supplement to his annual report, and in the last supplement issued, that for 1885, this table appears. It is daily being quoted from by different organisations with a view of supporting the special object of whatever movement the organisation is connected with; but as it has been very reasonably stated that a man can prove anything by statistics if he is allowed to pick and choose only such items as suit his purpose, we herewith publish the table in full. Instead, however, of merely copying the official arrangement, we have put it in the form of a diagram, and given the occupations in their mortality value so as to appeal to the eye at once. It is based on the returns for 1880, 1881, and 1882, and it shows the mean mortality of males between the ages of 25 and 65 engaged in the different occupations as compared with the mortality of all males of similar ages in England and Wales, this mortality being taken as the 1,000 in the terms of which the rates are given. It does not give all trades, but the selection is representative.

There is one trade, it will be found, that has exactly the average mortality, and this, unexpectedly enough, is that of the tobacconist! The tendency of the table is to prove that the nearer the liquor the shorter the life; but what are we to say to a table that gives the smoke-seller (52) as the mean? One would think we were dealing with some Mahometan land, where the million smoke and not one touches alcohol. Dr. Ogle, in whose official letter to the Registrar-General the table occurs, gives a large number of explanatory notes concerning its details, but of the tobacconist he says nothing. Probably "a table of occupation-mortality in terms of the tobacconist" was anything but what he expected when he began to put the statistics together.



That the Minister of Religion should head the list is what was to be expected. As a rule, he is of healthy descent, he is carefully trained, he looks after his health, he has healthy food, lives in a healthy house, works healthy hours, and has a congenial occupation. As Dr. Ogle says in his notes, "When an insurance society states in its prospectus that of its assured a large proportion consists of clergymen, it doubtlessly states a fact much in its favour, supposing the premiums paid to be those based on the average lifetime of all professional men."

It was also to be expected that the Gardener would hold a good position. He has healthy out-of-door work, and generally a healthy, comfortable home. That he is healthier than the farmer is probably due to the fact that he has not so much money to spend—at least, it would seem to be so on referring to the causes of death, where the liquor tell-tales—alcoholism, gout, and liver disease—are found to be far more fatal to farmers than to gardeners. That the Agricultural Labourer should occupy the fourth place is almost as surprising as that Dorsetshire, where the labourer was supposed to be at his worst, should have the lowest death-rate of the counties. The rate, however, may be placed a little too high, as, owing to the confusion in the returns between different kinds of labourers, it was thought to be safer to base the calculation of the death-rates upon all labourers, whether called agricultural or simply labourers without any prefix, in ten selected counties, in which an overwhelming proportion of the labourers would indisputably be agricultural.

Paper Makers hold their position (5) chiefly to the fact that the only unwholesome processes in the manufacture are the preliminary operations of cutting and sorting the rags, which give off clouds of dust, and serve sometimes as transmitters of infectious diseases such as smallpox; but these preliminary processes are almost exclusively in the hands of women, while the table concerns itself solely with men.

The rate for the Stocking Makers (6) is based entirely on the returns from the hosiery districts of Leicestershire and Nottinghamshire. Schoolmasters occupy the seventh place. Their death-rates have shown a gradual decline for some years, "probably," says Dr. Ogle, "in consequence of

# COMPARATIVE MORTALITY IN DIFFERENT OCCUPATIONS.

the improved status which the profession has been gradually acquiring." The death-rate of Wheelwrights (8) has also been declining for some time.

Grocers (11) often deal in spirituous drinks, and again the three tell-tales—alcoholism, gout, and liver disease—appear prominently in the death-cause tables.

Shipwrights (12), like wheelwrights, have been improving in healthiness during the last few years. Fishermen (13) would be as healthy as farmers if so many did not lose their lives from accident; but, unlike the farmers, the liquor diseases are rare amongst them, and they have a much higher mortality from diseases of the heart and other organs of circulation. Carpenters and Joiners (14) also come out well in the disease return—"they are healthy all round."

Booksellers (15) are grouped with stationers. Maltsters (16) are also a healthy class. To account for their position, Dr. Ogle remarks that "they are concerned with the materials, and not with liquor itself"—a suggestion doubtless due to John Barleycorn. Ropemakers (17) become healthier every year at all ages. Barristers and solicitors, grouped as Lawyers (18), become healthier up to forty-five, and then die off more quickly than they used to do, as is indeed the case in many other occupations. Silk Operatives (19) of course come out creditably, as in silk factories both dust and high temperature have to be avoided in order not to injure the material.

Shopkeepers (21) are general shopkeepers not otherwise classified. Drapers (22) include Manchester warehousemen. Dr. Ogle has something to say with regard to drapers which is curious. "The contrast between drapers and grocers in regard to their respective mortalities from phthisis and tuberculosis is not improbably referable in part to the very great differences observable between an ordinary draper's and an ordinary grocer's shop. The latter has, as a rule, the door wide open, and, not being usually of great size, is thoroughly ventilated; the draper's shop generally has the door shut, or at any rate not so widely opened as the grocer's, inasmuch as dust would damage the goods; it is of considerable depth, and crammed with wares that are constantly being moved about, and that give off fluffy dust during the process. The air is further fouled by numerous gaslights required to show off the goods; and this vitiation is in most cases distinctly perceptible to the nose. Thus probably it comes about that the drapers' mortality from phthisis is one of the highest, while the grocers' is one of the lowest in our list."

Grooms (24) include private coachmen; Mechanical Engineers (25) include machine makers, fitters, millwrights, and boiler makers. Coal Miners (26) are surprisingly healthy, but then no weakly man is likely to start as a coal miner if he can help it. The figures are taken on an average of six different districts, varying very much in healthiness. In Derbyshire and Nottinghamshire the coal miner would rank between the wheelwrights and lacemakers with 734; in the West Riding of Yorkshire his 772 would take him just above the shipwrights; in Durham and Northumberland his 873 would take him above the drapers; but in Staffordshire and Lancashire his 929 would put him below the average of his trade; and his 1081 in Monmouthshire and South Wales would take him below the average of all his countrymen—that is to say, below the tobacconist.

With Plasterers (28) whitewashers are included. Watchmakers (29) of course include clockmakers, and possibly a good many jewellers. Tanners (31) include fellmongers; they hold a high position considering the stenches to which they probably get habituated. Tallow Chandlers (32) include soap-boilers, to whom the same remark would apply. Artists and Architects (33) include engravers and sculptors. Among the Instrument Makers (35) are included the watch and clock makers and jewellers it was found possible to separate from 29. Soap and Glue Makers (36) include tallow and manure manufacturers. With Slaters (37) are included tilers.

Commercial Travellers (40) owe their position, apparently, to their active out-door life, for their return as to alcoholism, gout, and liver disease is very bad, and in suicide they come second. It is, of course, possible that they are attended by unusually outspoken medical men, who have no scruples about hurting the feelings of their relatives by plain-speaking on the death-certificate.

Bakers (42) include confectioners; they have also a bad return with regard to the alcoholic diseases and suicide. Furniture Operatives (43) include cabinet-makers, upholsterers, and French-polishers; and Gasfitters (44) include locksmiths and bellhangers. Masons and Bricklayers (46) include builders. Although bricklayers have the reputation of being intemperate, it is noteworthy that in the alcoholic diseases they are below the average.

Fishmongers (47) include poulterers. Copper and Zinc Workers (50) include lead and brass workers. Commercial Clerks (51) are naturally very varied; the grouping practically includes every kind of clerk except the limb of the law. The death-rate of clerks is much less than it used to be, owing perhaps quite as much to athletic sports as to the improved sanitary conditions of the offices.

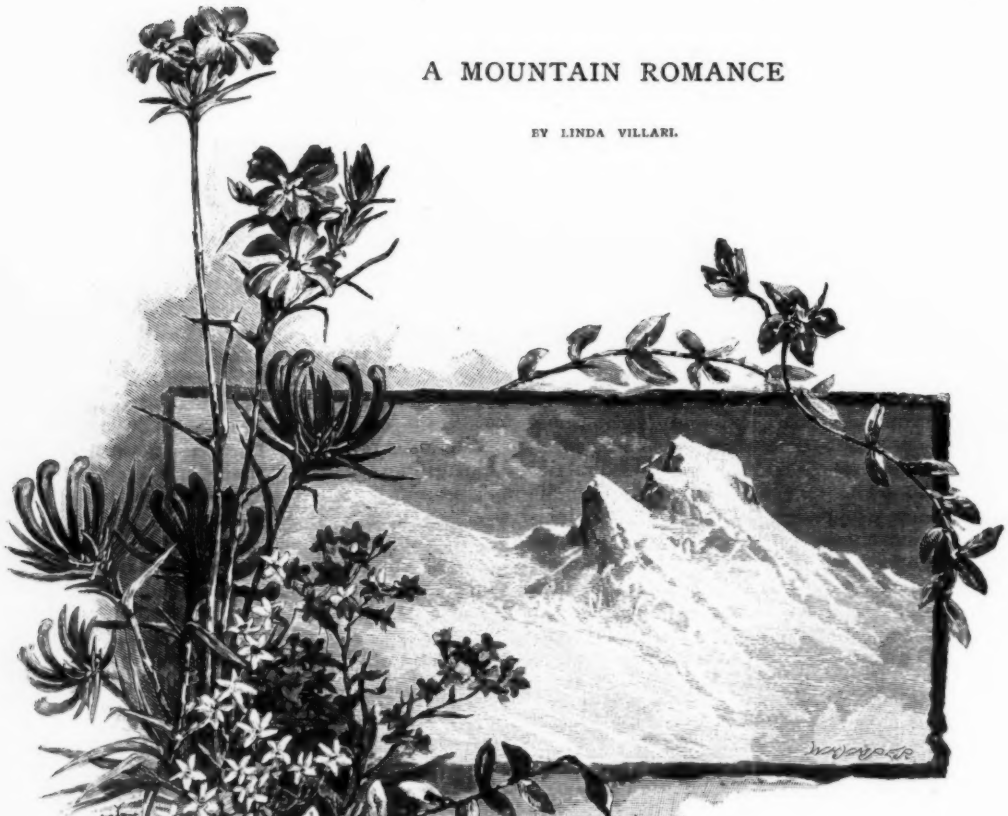
Buttermen (53) include milkmen and cheesemongers. Calico Printers (54) include the dyers and bleachers of all textile fabrics. Wool Operatives (59) include both wool and worsted mill-hands, and the figures are based entirely on statistics from the West Riding of Yorkshire. Printers (62) have declined in their death-rate of late years. They owe their unfavourable position entirely to phthisis, the rate of mortality from that cause being actually more than twice as high as the average, the explanation of which is that they have to work under notoriously unhealthy conditions in ill-ventilated rooms, and in an atmosphere unduly heated by engines and gaslights. When the electric light is introduced into the offices there will be a vast improvement in the death-rate.

With Coopers (64) are grouped the wood-

turners and box-makers. Why they should be so much more unhealthy than carpenters and sawyers is not apparent, unless it is that they are more employed indoors and suffer more from thirst. Medical Men (65) is evidently a clear case of "Physician heal thyself," although the report very judiciously omits to state what are the diseases to which the doctors succumb. An ordinary practitioner's day is never done; morning, noon, and midnight he is a slave of the door-bell, and the constant wearisome work, seven days a week, must have an important influence on this waste of life.

There is no doubt as to the reason why Butchers (69) live short lives. The disease table shows it at once; the liquor tell-tales cry out only too clearly. Tool Makers (72) include saw makers, needle makers, pin makers, etc. Watermen (74) include bargees and lightermen. Musicians (76) is a somewhat puzzling entry. What can there be so unhealthy in the practice of music? The explanation is that under musicians are grouped not only Royal Academy professors, but organ-grinders, street niggers, and German bandsmen. Hairdressers (77) owe their high mortality to drink, due perhaps to their having to breathe hair particles instead of fresh air. The high mortality of Cab and Omnibus men (79) is to a certain extent due, in Dr. Ogle's opinion, to a considerable portion of them having taken to the occupation as a refuge, owing to their having fallen from some superior status in consequence of ill-health or evil ways. But as in the case of the brewers, just above them, there is a great excess of the tell-tale liquor diseases. In the case of the Licensed Victuallers (81) the mortality attributed to alcoholism is more than four times as high as the average, and in the case of liver diseases it is actually six times as high as the average. It has been stated with authority that these extraordinary rates are not due to the licensed victuallers as a class, but to about 23 per cent. of them; in which case the drinking practices of this 23 per cent. must be simply outrageous.

The position of Watchmen and Porters (82) including messengers, is accounted for by its being chiefly "gentlemen who have failed in other professions," and sunk very much down in the world, who so describe themselves. That of the File Makers (83) is due to the metallic dust from the grindstones and the lead cushion on which the files are struck. In this trade there is an unmistakable call for some life-saving invention, however its introduction might be opposed by the short-sighted workers. The high mortality of Potters (84) is due to the inhalation of air charged with fine irritating dust, and to exposure to great vicissitudes of temperature, the main causes of death being phthisis and heart disease. Here, again, the state of affairs is a scandal. The potter dies from his work, and not from alcoholism, as is often said by those who never look at the disease-tables.



The position of Cornish tin miners—for that is really what Metal Miners (85) means—is almost inexplicable. Nearly two-thirds of their total mortality is attributable to phthisis and respiratory diseases, and as a class the men are notoriously well-conducted and temperate. It has been sought to explain the excessive death-rate by "the emigration of the strongest," but even that hypothesis will not cover the whole field. The file makers, the potters, and the metal miners come in, it will be seen, to break the alcoholic curve, and their presence is as embarrassing to the total abstainer as that of the average trade is to the anti-tobacconist.

With the Street Hawkers and Costermongers (86) we resume the liquor line, although the high rate of mortality is not due to the special unhealthiness of the occupation, as to the kind and condition of a large proportion of the men who adopt these means of livelihood. Costermongering is the most melancholy of pursuits; there are more suicides among the costermongers than among any other men. Of much the same class are those who describe themselves as Labourers in our great cities (87). In the London return the mortality figure for this class is 2,020, the highest but one in our list. It is really the highest but two with which we have to deal, for there is a more unhealthy life than that of a London labourer—namely, that of the man who, according to the signer of his death certificate, does nothing at all. The figure for Unoccupied Males is 2,182. That for the servants and understrappers and general hangers-on at inns and hotels, whom we have grouped as Tavern Servants, is 2,205; with regard to which it should be mentioned that such servants work, as a rule, seventeen hours a day for seven days a week; and that the men who occupy such positions are either those who have failed in other pursuits or else have been born of parents "in the trade," who have sent them into the world with a constitution calculated to astonish even the mortality table maker. Between the 556 of the clergyman and the 2,205 of the potboy there is an appalling difference. But how different are the conditions under which they are born and live!

Melancholy as are these figures, there is one great comfort regarding them as a whole—they are much better than they used to be. As Dr. Ogle says—"The changes in the death-rates have given to the community an annual addition of 1,800,047 years of life shared among its members; and, allowing that the changes in the death-rates are the direct consequences of sanitary interference, we must regard this addition of nearly two million years of life as an annual income derived from money invested in sanitation."

# A MOUNTAIN ROMANCE

BY LINDA VILLARI.

ALPINE FLOWERS.

WE found the rest of the party assembled in a long, low ground-floor apartment, evidently used both as dining-room and study. One big table was laid for our meal, another littered with papers, writing materials, and a pile of business-looking books, brass-cornered and bound in calf.

A huge porcelain stove stood in one corner, pots of ivy and carnations on the window-sills; the furniture was solid, the wainscoting dark; there was a raftered ceiling and a parquet floor. It was a thoroughly German interior, German as the family name, and it was hard to realise that we were on Italian soil.

The Baroness occupied a very tall high-backed chair, and was chatting briskly with my brother. She held a book in her hand, and I saw, to my surprise, that it was the French version of Kit's newest novel. Who would have suspected this mountain magnate of any acquaintance with current literature? Yet, as I soon found, our presence at Chamonal was due to my brother's fame rather than to our care of Elena, for the Baroness made some very pretty speeches about her interest in Christopher's works.

The other persons present consisted of a rustic-looking matron, two insignificant men, and a buxom young lady, whose breadth of bust and plumpness of arm served for the display of many gold chains and jingling bracelets, and whose fluffy hair was guarded by a bristling fence of tortoiseshell spikes. These fellow-guests were solemnly introduced to me in turn. They were all related to our hostess, and all named Felsen-Luscoz or Luscoz-Felsen. But we had hardly exchanged civilities before lunch was served, and the Baron led me to my seat. The old lady took Kit's arm, and as she moved across the room to the head of the table I was impressed by her commanding personality.

Clothed in a straight black gown, with a wisp of rusty lace on her white head, and no ornaments save the small diamond solitaires in her ears, she had the air of an empress. She interested me immensely, and I was glad that the Baron seemed too hungry to talk. And I soon saw that no general conversation was required; our part was to play chorus. Now and then Elena interchanged a word with the nondescript relations, and the lady of the pins and chains seemed to

have an old-standing joke with my neighbour; but whenever the Baroness opened her lips all eyes converged towards her, and respectful silence prevailed. She was familiar with Paris, it appeared, touched on French politics, the stage, and society, and was pleased to find that my cosmopolitan Kit knew some of her friends in that city. Then, reverting to the charms of her valley, she inquired what excursions we had made.

Kit explained that he was very busy with his pen, but hoped to do some mountaineering soon.

"Dr. Bondaz says we must certainly climb the Grauhaupt," I remarked, anxious to see what effect our friend's name would produce.

"Ah! you know the Doctor?" said the Baroness, flashing a keen glance at me. "You will probably see a great deal of him if you attempt that mountain. Even for Alpinists it is tough work. It is true you English ladies are prodigiously strong."

Disclaiming all unusual powers of endurance, I meekly rejoined that most likely my brother would have to make the ascent alone, and, adding that there were many delightful excursions within easier reach, expressed my surprise that Gressoney should be so little known.

"Better so!" exclaimed the lady, tartly. "The less known the better. Long may our people preserve their virtuous simplicity! We do not prey upon foreigners, like our Swiss neighbours at Zermatt."

No, you only swindle relations, I thought, while Kit took up the gauntlet for his beloved Zermatt by gently suggesting that in some respects Italians might do well to imitate the Swiss.

"For instance, Baroness," he said, smiling, "even fair Gressoney would be improved by a carriage road, a few good shops, and a resident medical man."

But he had touched on a tender point, and the Baroness eyed him with haughty displeasure. Clearing her throat, as if with an effort, she replied that Gressoney needed no change. Ease and luxury brought corruption; it was already difficult to manage the people, thanks to new notions imported from Switzerland. She did not wish to see the valley swarming with tourists; she had vetoed all improvement of the road.

"Really," she concluded, "while we natives are content to have our supplies of furniture and other bulky things dragged up on sledges in the winter, the strangers who honour us in the summer months need scarcely complain of inconvenience."

Without seeming to notice her ill-humour, Kit went on with good-tempered persistence:

"Putting strangers and their wants out of the question, why, my dear lady, should the inhabitants be cut off from the conveniences of life for lack of a little enterprise? Why is there no doctor in a populous place, with a mayor and corporation? For yourself and family, for instance, would it not be safer were our young friend Bondaz established at Gressoney, and safer still if his prescriptions could be made up on the spot, instead of being sent to Ivrea? In serious illness such delay must be fatal!"

"My good Monsieur Crane, you are too pessimistic," rejoined the Baroness, with a harsh laugh. "Let the valley folk do as their forefathers did—trust to Heaven and their own wits. Our remoteness from so-called civilisation, our pure air and water, are the best safeguards. There is little disease here; no *goitres*, no *crétins*, as in the Val d'Aosta. Young Bondaz has infected you with the heresies he brought from Turin. 'Tis a pity he did not stay there! He is as mad as his father."

The Baroness said all this in a cold, indifferent tone, but her hand trembled as she raised her glass to her lips, and there was a cruel gleam in her eyes.

I glanced at Elena. Her sweet little face was glowing with indignation; she breathed quickly, and seemed on the point of breaking into eloquent remonstrance. I pitied the child, and, with my usual rashness, threw myself into the breach by sounding the Doctor's praises, and relating all I had heard of his talents. "But, like yourself, Baroness," I concluded, "he is devoted to Gressoney. It is charming to hear his enthusiasm for his native place."

"Nevertheless, this paragon of yours is not a native," rejoined the Baroness, in so sneering a tone that I impulsively said,

"Indeed! I thought he was connected with your house. He has quite the family face."

Her eyelids quivered. "You have been misinformed," she said, hastily. "The Bondaz are of peasant origin."

There was a pause; Kit looked alarmed; the kinsfolk stared steadily at their plates, when suddenly Elena broke the silence in gentle expostulation, "Grandmama! you forget. Was not Franz's mother a Felsen?"

If glances could kill, the savage flash of her grandmother's eyes would have burnt Elena to ashes on the spot. And there was terror as well as wrath in her face. The poor girl seemed amazed by the effect of her words, and bit her lips to keep back her tears. I was full of self-reproach for the indiscretion that had provoked the scene. On the strength of a village tale I had transgressed every rule of courtesy, and injured the persons I wished to befriend. What had I to do with the Doctor's birth or the misdeeds of Baroness Felsen? But, while calling myself to task in this fashion, I was blandly smiling on the Baron, refusing cakes and fruit, and feigning unconsciousness of the set white face at the head of the table.

It was all over in a few seconds. Our hostess turned to the servant at her elbow, bade him serve coffee in the summer-house, bowed to me, and, remarking that she would show the way, swept from the room on Kit's arm, while I followed meekly with the Baron, and Elena disappeared through another door.

This Felsen house was as enigmatic as its owner—as full of startling contrasts. The homely Teutonic dining-room opened into a thoroughly Italian saloon, all crimson satin and gilding. Then came a boudoir, furnished with soft æsthetic tints, stamped leather hangings, Persian rugs, Japanese

bronzes, and rare old china. But the colossal spittoons, standing guard over the chairs, and a rack of pipes by the stove, showed that this charming retreat was mainly a smoking-room. Through a stained-glass door we passed out on to a terrace, where a broad flight of steps led to the garden. These steps were flanked on either side by a bronze chamois perched on a pile of rocks. They were very spirited works, and the Baron called my attention to their artistic merits. His father, he said, had brought them from Germany.

The garden was planned in the Italian style, with pleached alleys, fountains, and symmetrical plots of flowers, but it was evident that rustic thrift had prevailed over baronial taste. The dividing hedges were shapeless and untrimmed; the path to the latticed arbour was lined with gooseberry and currant bushes; the beds were stocked with vegetables. Patches of double poppies and lupins were cheerful notes among the greenery, but these too were grown for use rather than ornament.

Nevertheless, this homely pleasaunce, high above the valley on the tongue of the castle-cliff, formed an ideal point of view. A gracious mosaic of moor and meadow, of homesteads and rocks, lay beneath, intersected by the silver thread of the Lys. Sun-kissed woods rose steeply behind, dark forests streamed down from the opposite range. Further up the valley the mountains shrank back on one side before the frowning advance of the Grauhaupt on the other. Sunshine here, shadow there, a confusion of crags and cascades and black ravines; and beyond, just where giant forms, dimly discerned through masses of vapour, clustered round the head of the vale, a sudden break in the clouds revealed the glittering ice of the Lyskamm and its solemn fields of snow.

The Baron hurried me on to the end of the garden, and I was wondering at his sudden ardour to show me points of the landscape, when he interrupted my remarks on the scenery by asking, with a sudden change of manner, if I thought that fellow had any notions in his head.

AT THE HEAD OF THE VAL DE LYS.

"What fellow?" I inquired.

"Why, the Doctor, of course!" he said, with an unpleasant glance. "You seem to take an interest in him. We all know," he went on, prodding the ground with his stick, "that he must be connected with us in some irregular way; everyone sees the likeness. Does he refer to it? If so, he shall have a lesson, and be taught to keep his place!"

I was disgusted by the man's tone, and, coldly

replying that as I was not in the Doctor's confidence I knew nothing of his views, began to retrace my steps. My companion hurried after me, explaining with elaborate politeness that he had asked the question because the Baroness was very sensitive, and disliked all allusion to the matter. He could not understand what or who had prompted his cousin to speak of it. To this I rejoined by expressing regret for my own inadvertence. By this time we had reached the arbour, and with another dubious glance he bowed himself away and went to join the smokers on the terrace.

I found my hostess fast asleep in a big chair. She seemed grimmer than ever with her eyes closed, but I felt a certain softening towards her as I noticed the lines of pain on her blanched old face. The two kinswomen received me with smiles, and, putting aside their knitting, inquired my wishes as to sugar and cream in the softest of whispers. Elena was employed in serving the men with coffee and liqueurs, but soon came to carry me off. Her grandmother always dozed after lunch; there was time before she woke to show me the prettiest corner of Chamonal. I was only too glad to escape. Subdued small-talk in bad Italian, under the nose of a sleeping hostess, was not entertaining. Elena seemed to have forgotten the scene at table, and, although her eyes were rather red, she was quite calm and cheerful. Turning past a ruined watch-tower at the extremity of the garden, we took a rough path through a larch-wood, clambered down some rocks, and suddenly came to an enchanted dell. A cascade fell flashing through the trees into a little pool at our feet. Parnassus-grass and forget-me-nots enamelled its banks, and beyond a plot of turf rosy cyclamen bloomed at the foot of the rocks. There was a peep of blue sky overhead, a shimmer of emerald light through the larches, and where the torrent hurried down to its next leap, through a natural arch, we saw, framed in the opening, the town of Castel on its tree-fringed bluff across the valley.

"What a fairy bower!" I cried, sinking down on a mossy stump. "Just what I used to dream of as a child. But to make it perfect there should be a little house made of cake, with alicampane windows and a little old witch spinning on the doorstep!"

Elena stared. She had not been nourished on Grimm's tales, but she seemed a true fairy princess as she flitted about in her bright dress gathering a posy of flowers.

"It is my own little nest," she said. "How I used to long for it at the convent! Franz discovered it years ago; he used to hide me here whenever Carlo and the rest were unkind."

"So your friend Franz was not in disgrace then?" I asked.

Her face assumed the look it had worn at dinner. "Grandmamma was often horrid to him even then," she said, emphatically; "but Carlo's father loved him and insisted on having him at the castle. I suppose," she added, reflectively, seating herself at my feet, "that grandmamma dislikes him on his father's account. He has done nothing to offend her, and, whatever she may say, he is one of us, for his mother was cousin to mine. Tante Luisa knows the whole story. Why should grandmamma try to deny it?" She spoke sadly, but her mood quickly changed; and showing me a little cave, scarcely bigger than a dog-kennel, related how she had planned hiding there for life when told she was to be sent to Ivrea. Franz was to be her companion, of course, and their diet of berries and roots was to be varied now and then by midnight raids on the castle pantry. The pretty, sensitive, winsome girl! Had she been of my own kin, the child of poor Nellie herself, I could not have listened more tenderly to her artless talk. I speculated whether she would fight her way to happiness, or succumb to the obstacles in her path. Perhaps, like the dainty flowerets blooming in stony wastes, she too would flourish in spite of her harsh surroundings.

We were scrambling back to the garden by a short cut, when I saw the Baron coming towards us. My elderly gymnastics probably roused more surprise than admiration, for he reproved Elena for bringing me over such difficult ground. The Doctor's fears were surely unfounded! There was nothing of the lover in his manner towards his cousin.

Our hostess was wide awake now, and discussing politics with Kit. She received me most amiably, was glad Elena had taken me to the best points of view, and when we presently rose to take leave, said it was too early to go, and that she must first show us the "marriage crowns" I had expressed a desire to see. So we all streamed upstairs to a long gallery hung with grim family portraits, and among these stiff knights and dames, courtiers and ecclesiastics, I recognised more than once the features of Dr. Bondaz. Meanwhile, the Baroness selected a key from the cluster attached to her silver chatelaine, and, opening a press in the wall, displayed a treasure of heirlooms to our gaze. There were jewelled poniards and crucifixes, reliquaries, snuff-boxes, ancient gems, quaintly set jewels, precious lace and stuffs; but two shelves were entirely filled with the head-gear peculiar to the valley. The Gressoney crown is a disc of beaten gold similar to a saint's halo, set on a filagree cap fitting close to the head, studded with pearls and coloured stones, and with long streamers of ribbon behind, There were at least a dozen of these crowns of various sizes and designs, and richest of all was that worn by the Baroness on her marriage day. This she drew from its case, and after holding it up for our inspection, placed it on Elena's head. It was marvellously becoming, and gave a strangely fantastic charm to the fair young face.

"It suits you rarely, child!" exclaimed the Baroness, drawing back and regarding the girl with the first kind glance I had seen in her hard old eyes. "It shall be yours if you please me. See, Carlo!" she added, "here is a true Gressoney bride."

The Baron's face expressed the coarse approval commonly accorded to female beauty by men of his stamp. Elena reddened painfully under his gaze, and, snatching the crown from her head, hastily replaced it on the shelf.

The Baron turned on his heel with a shrug.

our hostess frowned, and the two kinswomen made gestures of dismay, volubly declaring that it was most unlucky to assume a bridal crown before the due moment. The old lady silenced their clamour by ridiculing their fears, but her face betrayed deep annoyance. She scarcely listened to our well-meant remarks on the beauty of old customs; so, returning thanks for her hospitality, we hastened to take leave.

"Your cloak, madame. You are forgetting it.

A MARRIAGE CROWN.

Oh, please come with me!" pleaded Elena, in a tremulous whisper, and on reaching her room she threw herself sobbing into my arms. What was it? I asked. Surely she was not alarmed by those foolish predictions!

"No, no," she cried, trying to check her tears; "but you heard what grandmamma said—and I —*cannot* obey her."

I did my best to soothe the terror-stricken girl, adding that nowadays no one could force her to marry against her will; she must be firm, insist on her right to choose for herself, and then, moved by pity, I imprudently added,

"You have one good ally, at all events. You know who it is—he bids you be firm and patient."

"Did he say so? Do you think?—Oh! then we can defy them all!" she cried, with a sudden radiance in her eyes.

I was burning to confide my discoveries to Kit as we tramped down the mountain side to the main track, but unluckily the Baron had elected to join us. I could not bear the sight of the man, so, leaving him to prose about avalanches with Kit, I walked on ahead. This part of the valley was new to me, and I was struck by the thriving air of the various hamlets, and the number of solid houses flanked by spacious farm buildings and timber stacks. Flowers bloomed in all the windows, and even the humblest cottage had a garden patch among its potatoes and cabbages.

One house only turned a blank face to the road. It was closely shuttered, and strips of black ribbon fluttered from balcony and door-knocker. It was in mourning for the master, I was told, and the family had withdrawn to the farm at the back.

We found sleepy Gressoney wide awake and all bustle and commotion. Part of the Alpine regiment, or frontier corps, was camping there on its march to the Col d'Ollon. Rows of little brown tents had sprung up in the field behind the post-office, horses stood picketted in rings, and wiry little men in grey and white were lighting fires, planting kettles, scampering to and fro with hay and straw, or marketing with the peasants. Officers were lounging about, and there was quite a crowd of new faces outside the village inn. The Baron's indifferent air suddenly changed to one of pleased surprise. Would we excuse him?—some friends had arrived! And the next instant he had plunged into the group by the inn and was eagerly accosting two ladies. One of the pair was young and strikingly pretty, the other a faded impression of the same type. Both seemed delighted to see the Baron, and his face spoke for itself as he took the girl's hand.

"Ha, ha! a clear field for the Doctor!" I exclaimed, and, taking Kit's arm, related my last scene with Elena.

He was full of sympathy. Something must be done; the poor child should not be sacrificed. And he tugged at his moustache as he always did when in earnest. But, having stirred him to this point, I began to feel alarmed.

"After all, we can do nothing," I said, despondingly.

"You will see; all will go well in the end," he replied. "Ah! here comes that old curmudgeon Denabian!"

We were near the bridge, and Elena's father was riding towards us. He apparently lived on horseback, for I had never yet seen him disjoined from his pony. He was about to pass us with his usual surly nod, but Kit laid a finger on the bridle, and, addressing the old boor in his most genial way, told him we had just seen his daughter. I chimed in with smiling amiability. The man's churlishness gradually abated, and before we left him he had given us an invitation to his mountain dairy, where, he said, we should have at least as good a welcome as at Chamonal.

VI.

WHAT was this stir in Gressoney? Had the Alpine corps roused the quiet natives to revolt? Strolling into the village the second day after our trip to Chamonal, I found quite a crowd in the square. Men were talking excitedly, women crying; the mistress of the general-shop stood wringing her hands on the doorstep, and everyone wore an air of dismay. I saw Dr. Franz striding away in close conversation with an officer, and Tante Luisa up in her balcony craning her neck to look after him. Could anything be wrong at the Denabians'? I was making my way across to inquire, when my landlady's boy came rushing against me, breathless with excitement, and I soon learnt what had occurred. One of the soldiers had fallen over a precipice and been killed. He had gone up the mountain after edelweiss the previous evening, and outstripped his comrade, who had returned alone. Was only missed at roll-call. Search parties had been out all night; his body found this morning up there by the waterfall, a bunch of edelweiss clasped in his hand. So far the panting boy, who then wriggled off to seek further details.

I was passing on to the post with my letters when Tante Luisa caught sight of me, and came down to the door to meet me, full of the shocking event. Her cap was awry, her wrinkled cheeks were wet with tears.

"That poor young man! Only twenty-two! Such a promising soldier, and the best climber in the regiment! His captain had asked him to pick edelweiss for some ladies at the hotel. He had slipped on that treacherous slope—crashed down over the rocks by the waterfall. We knew the place. It was shocking—shocking! Yes, Elena was at home, but terribly upset. What, didn't I know? It was Elena who found the body. She had come down early from Chamonal, taking the river path; had seen the poor man on the ground, thought him asleep, and was passing quickly on, when she noticed blood on the rocks. Finding him to be quite dead, and horribly crushed, she had flown to give the alarm, and reached home almost fainting, She was better now, but needed rest. Would I come to see her later?"

Leaving kind messages for the dear girl, I walked on in a saddened mood. Poor little Elena! What evil Fate dogged her steps? At the threshold of her peaceful valley less than a fortnight before she had been brought face to face with the destroying angel, and now again she had looked on death! A superstitious thrill ran through me. Were these events premonitions of some still more terrible tragedy? The next time, where might not the blow fall?

The sombre folds of the mountains seemed full of threats, the ice crests pitilessly cold! The soft wind rustling through the woods sounded softly; there was a note of mockery even in the voice of the Lys; storm clouds were drifting up from the south; all the glamour was gone from the scene; the valley lay shadowed and desolate in the grip of the hills!

After all, we are abominably callous to others' woes, and, ourselves unhurt, sympathy is an easy vent to a pleasant sense of escape. Half an hour later I was plunged in London chit-chat with friends suddenly arrived from Zermatt. Perhaps their holiday spirits helped to restore mine. Kit had heard my tale with sympathy, but pooh-poohed my presentiments of ill. "Accidents happened everywhere," he remarked. "I put it to your common sense, Joan; if Elena were in London now, would you expect some tragedy to befall her because she chanced to see a man run over, or another fall off a roof?"

And just then, with a great clatter of nailed boots and alpenstocks, those friends from Zermatt burst into our room. Nevertheless, when the village bells began to toll, Kit and I quietly slipped away to the soldier's funeral.

All Gressoney was gathered in the church, the altar a blaze of light, a row of burning tapers on every prayer-bench. Soldiers bore in their dead comrade on his flower-decked bier, while the rest of the men and their officers stood reverently ranged along the aisle. It was a most impressive ceremony, and scarcely a face in the church was unmoved. As we slipped into seats near the door I recognised Elena and her aunt in the veiled figures kneeling beside me.

"You should not have come," I whispered, as a trembling hand pressed mine.

"It was my duty," she returned.

The service was soon over; priest and acolytes moved from the altar, and we all followed the procession to the grave. There was barely space for the crowd in the narrow paths of the cemetery, but all made way for Elena as she stepped forward to place a wreath of choice flowers on the coffin; and the soldiers hailed the kindly act with a murmur of gratitude. The girl's veil had fallen back, and standing there in the evening light, so pale, pitiful, and reverent, she scarcely seemed a thing of this earth. No wonder that Dr. Franz, whose head rose above the crowd, should have watched her with so tender a look on his face.

It jarred on my nerves at this instant to hear a woman's voice near me ask "who that pretty girl was." The speaker was the Baron's friend, the brilliant blonde from Turin, and it was the Baron who replied, in a sneering tone, "Only one of my country cousins."

"What good souls are these Gressoney folk!" I exclaimed, when all was over and Kit and I were hastening back to our cheerful friends at the hotel. "Tante Luisa tells me that half the village joined in the search for that poor man, and that no one thought of going to rest until the body was found."

"Yes, they seem to be a simple, kindly race," replied Kit; "but don't think me very cynical, Joan, if I add that, in the monotony of their life, even a tragedy is a godsend. It stirs their pulses, you see, and gives them something to talk of. Besides, the love of these mountaineers for their hills is strongly mingled with dread. They cannot forget the perils of rock and ice, for no year passes without its tale of victims. These guardian peaks are tyrants to those dwelling at their feet—Nature,

a stepmother, exacting sacrifice from her children. The inhabitants have, I am sure, a misty, undefined feeling that this poor soldier's death is some assurance of safety to themselves. He was called, so they are left; the spirit of the mountain is propitiated for a while. Human nature is still very pagan at bottom."

"Oh, you are too analytical!" I cried, impatiently "Never mind what hidden motives prompted the kindly deed, the deed remains. Few good deeds are purely altruistic, yet the world would be poorer without them."

Christopher laughingly remarked that, womanlike, I was begging the question, and cast his cigar-end into the swiftly-rushing stream.

I went on, eagerly: "If everything must be analysed, then our interest in that dear little girl and her love-tale is entirely spurious. It hurts us to see her suffer merely because she resembles one who was dear to us: not at all for her own sake. We sigh and sympathise, are curious about her concerns, yet are powerless to help her in the least. We shall soon go away, forget all about her; only once in a while, perhaps, sitting by our London fireside, we shall recur to the Gressoney romance and idly wonder how it ended—whether Elena married the Baron after all, and what may have become of the Doctor."

"Speak for yourself, Joan!" cried my brother, standing still and turning to me with an odd, far-away look in his eyes. "It is no spurious sentiment—on my part at least. You don't know—for I never told you—it is hard to speak of these things; but down at Ivrea I had the strangest experience. Night after night my angel wife visited my dreams. I always beheld her pointing to a dim figure in the distance—a young figure with a face strangely resembling her own, only sad and tearful, whereas *hers* was radiant. She seemed to command me to approach the figure, but whenever I tried to move towards it a great flood of water rose at my feet and kept me back. Yet I felt no perplexity. Nellie's face told me that the time had not come; I was to wait. And then I always awoke with a feeling that I had a definite task to perform, although ways and means were still hidden. At first sight of Elena Denabian I understood some part of the vision—*I was to help her.* How, will be shown in due time. The dream has never been repeated here. Nellie knows I shall obey her."

"Kit—my dear Kit!" I began, with a sudden return of my old foolish fears, but something in my brother's face checked the words on my lips. I felt strangely moved, and, squeezing his hand affectionately, I only murmured, "And I will help you; we will do all we can."

Then hand-in-hand, as when we were children together, we turned from the shadowy path by the river and stumbled across the dewy fields towards the light and warmth of our inn.

VII

BUT though silenced and carried away for the moment, my brother's confidences gave me a restless night, and I prowled up and down the balcony, looking out over the moonlit valley, listening to the mingled voices of cascade and river, and vainly trying to calm the whirl in my brain. Kit was a constant surprise to me; but hitherto the fantastic strain that gave so much charm to his books had seldom clashed with his common-sense views of life. To my sisterly eyes, as well as to those of the outer world, he was a cheerful, energetic man, methodically dividing his time between brain-work and amusement; a keen student of humanity; and, though full of benevolent interest in his fellow-men, usually more generous with his purse than his time. "His mission in life was to write books," he said. Yet, on the strength of feverish dreams—probably caused by the heat of Ivrea—and a chance resemblance to his dead wife, he now held himself vowed to the service of Elena Denabian.

I was angry, jealous, provoked, yet could not altogether blame him, and had actually pledged him my support! We were a couple of idiots. But it was sheer nonsense, of course. Nothing would be required of us; all would go well. Probably by the time we began to pack our trunks girl and lover would have carried the day against all opposition. Besides, what had we to do with their concerns? It was too ridiculous! What danger could threaten the child? And why should Christopher Crane, of all people, be called to play the knight errant? It had been a mistake to come to Gressoney. Could I not find some pretext for hurrying back to England? What, and leave Kit to his Quixotic schemes? No, that would never do; besides, had he not come to me in my need, cheered and consoled me? I must stand by him, and hope for the best.

So, towards cockcrow, I crept shivering to bed, and awoke from a dreamless sleep almost resigned to Kit's vagaries. For some days nothing occurred to remind me of them. Our Zermatt friends were still with us, charmed with the pretty valley and quiet, comfortable inn. They were alert, amusing people, living at every pore, equally interested in politics, social questions, literature, nature, and art. Their company seemed to restore Kit to his normal London frame of mind. He laid aside his work, and made long excursions with the men. The ladies of the party being satiated with mountaineering, preferred mild strolls with me and gipsy teas in the woods. Much to my surprise I saw nothing of Elena Denabian, and Kit never mentioned her name. The Alpine regiment had marched away the morning after the soldier's funeral, and the village had lapsed into its usual slumber. We met the Baron sometimes, but he was always in attendance on the Turin belle. We were a phalanx of English, and our intercourse was confined to bows. But one Sunday afternoon, when we were all busy with home letters, the landlady's boy rushed into the room, with "The Baron's compliments, and would we come out to see his chamois and bouquetins?"

We found the pretty creatures on the rough ground behind the house. About a dozen bouquetins and as many chamois stood clustered round their favourite keeper, gazing at us with a

suspicious air, as though ready for flight if we stirred a finger. The bouquetin, or steinbock, is not indigenous to the Monte Rosa district, and the Baron's herd had been reared from a pair imported by his father from the Cogne mountains. They are much thicker than the chamois in leg, neck, and shoulder; stately, sturdy creatures, dark brown or mouse-coloured, and with formidable knobbed horns about two feet in length,

THE BOUQUETIN.

bent back in a scimitar-like curve. We all stood motionless at first for fear of scaring the shy things, scarcely daring to whisper our admiration. But they presently allowed us to approach them, and several of the chamois took salt from our hands. The bouquetin were less tame, and only their keeper's voice kept them from rushing off in alarm. Two magnificent bucks with dark brown coats stood perched on a rock, watching us with fierce restless eyes, and despising our offers of salt. The Baron laughed at our attempts. "Those two were quite untameable," he said.

Just then I saw Elena emerge from the crowd that had quietly formed by the inn. She came nearer and nearer to our four-footed visitors. They eyed her, I thought, with friendly gaze, as though she were a sylvan thing like themselves, as, threading the herd, she pressed forward towards the defiant bucks. The next moment her red skirt was between their dark flanks, both beasts were licking salt from her hand, and accepting her caresses. It was the prettiest group—this slender, smiling human creature petting these forest kings. The keeper crossed himself as at sight of a miracle, and a low murmur of applause came from the crowd. Tante Luisa was fairly crying with delight.

"How did you do it? How did you do it?" we all asked when the girl slipped down from the rock and came quietly towards us.

"I love them, and they know it, perhaps," she replied, with a little catch in her breath.

"Cospetto, Elena! That would make a hit in a circus!" exclaimed the Baron, with a loud laugh. "You would be announced in big letters as the ibex charmer of Gressoney. Now, Signorina Adele," he added, turning to the young lady from Turin, "it is your turn to try, since" (here he lowered his voice) "the show is all in your honour."

The beautiful blonde smiled.

"Willingly, but not alone; *you* must come too," she said, archly. "And give me plenty of salt; that is the true charm."

The couple glided forward with infinite caution, and, as with us, the tamer beasts were gracious enough. But at their first step towards the big boulder the bouquetin took flight, leapt away, and the next instant the whole herd—chamois and ibex—were off, bounding up the steep hillside with keepers and boys in pursuit, and were presently lost to sight in the woods above.

The Baron, after shouting angrily to his men, led the Turin ladies to his unfinished mansion. "They could wait on the terrace," he said, "until the herd was collected, and brought back to the valley."

Our English friends were enthusiastic on Elena's charms. Who was she? Why had we never shown them this village belle? and so forth. The object of these remarks had gone into the inn with her aunt, but presently reappeared alone, and came towards us with a timid air, as though rather scared by the presence of so many strange faces. I hastened to introduce her to our friends. Noting her pretty modest ways, and the trustful glance of her sweet young eyes, I felt persuaded that even older heads than Kit's might well be turned by her beauty. Not that she made the least attempt to attract him; on the contrary, all her attentions were for me. It was so long since we had met: not since that poor soldier was buried. She had been up at Chamonal; her grandmother wished to come to call upon me, but had been too unwell. Now she had a great favour to ask. As usual at this season they were going to their dairy up in the hills at Chiaverena. "Would we spend a day there—any day that suited us best, but soon, in order to come home by moonlight?" Then, hesitatingly, "Would our English friends come also? She was sure her father would be delighted to see them."

I was not sure of this, and she seemed relieved when I said that our travellers were going over the Théodule Pass the following day, and that we were to accompany them to the foot of the glacier. Therefore, old bones needing rest between two excursions, might we fix our visit to the châlet a day or so later?

"That would suit capitally," she replied, "and Tante Luisa would have time to prepare a better welcome." The old lady confirmed this; she had just been arranging for supplies from that worthy woman the mistress of the inn.

"Where is our friend the Doctor? It is a whole week since I have seen him," asked Kit, diplomatically addressing his question to the aunt.

Tante Luisa explained that the young man had been called to Turin on business, but thought he had now returned to Issime. The Baroness needed

his advice, so he would soon be seen at Gressoney.

Just then the blast of the post horn was heard, and Beata came cantering up the path at the head of his mules. This lively *cavallaro* seemed proud of his importance as the connecting link between Gressoney and the outer world, and always halted a moment at the inn, to drop parcels, news, and messages, on his way to the post with the mail. As the Figaro of the village, Beata's arrival was the event of the day. On this occasion he brought various small parcels for the Denabians, and as he bent from the saddle to give them into the aunt's impatient hands, he said,

"I've a packet for the signorina too—those good sisters at Ivrea always keep her in mind—where can it be!" and jumping down he searched a basket fastened to one of the mules, and produced a cardboard box. But the letter simultaneously pressed into Elena's hand was dexterously juggled from his pocket.

Elena flushed crimson, and with a sudden motherly impulse I asked her if she would like to come upstairs and inspect her convent gift at once.

She assented with a dazed air, and her first words when we were alone in my room confirmed my belief that the letter came from Franz, and was the first she had ever had.

She was hot and ashamed. "Beata should have brought it to the house," she said, "or given it to my aunt. There can be no reason for secrecy; and what must you have thought, dear madame?" Her delicacy surprised as much as it pleased me; convent-bred girls, I fancied, were skilled in petty concealments.

Meanwhile she stood fingering the missive, eyeing it with a half frightened, half wistful air.

"If I were you, I would read it at once; it must be important," I said, laughingly, and turning away, I devoted myself to the rearrangement of my books. There was a short silence, a rustling of paper, then a startled cry, and Elena flew to me, holding out the precious letter. I took it reluctantly. Such an appeal to my matronly wisdom was equally unexpected and touching, for my own girls had conducted their love affairs with truly modern independence.

"Please read it. I don't understand," she stammered, with cheeks flaming, tears falling, and a tremulous smile. Yet the writer's words were sufficiently explicit. "He had made a strange discovery that might compel him to leave the valley for ever. An excellent post in Turin had been offered him for the following year. He could decide nothing until he had seen her. Would she let him speak to her father? Would she consent to leave Gressoney? Might he seek her father at Chiaverena, where there was no fear of meeting the Baroness?" Then followed a string of tender words and allusions which must have been perfectly intelligible to their recipient.

"What is it you cannot understand, dear?" I said, taking her to my arms. "If you knew he loved you—if you love him, of course he must speak to your father."

"Ye-es! but why at once? Why should he think of leaving the valley? And what discovery can he have made?"

Discovery! It suddenly flashed upon me what he had discovered, though to leave the valley for that reason seemed a *non sequitur*.

"Well," I said, hesitatingly, "perhaps he has too much talent to be content with obscurity—only doubts whether you would be willing to leave your native place. But you would follow him anywhere, would you not?"

"To the world's end," was the prompt reply; "but why this haste?"

"Lovers are always in haste, dear child. My youngest girl was whisked off to India just one month after it had been settled that the engagement was to last for two years at least. Come, sit down quietly, write a line to tell this ardent youth when he may appear at the châlet, and I'll give the note to Beata myself—that is," I added, "if you have quite made up your mind about Dr. Franz, and are prepared to face the grandmamma's wrath?"

"I would face the whole world for his sake, dear madame, but how—what shall I write?"

"Just that, I should say, or merely a word as to when he may come to the châlet. He will understand. Meanwhile I will keep your aunt company downstairs. She must be wondering what has become of us."

But the old lady had gone home, the landlady said, so I sat and knitted on the deserted bench by the porch, pondering over this new phase of the Gressoney romance.

Elena wrote her letter, confided it, with many blushes, to my care, and then I escorted her to her own door, with the packet from the nuns still unopened in her hand.

# THE NEWSPAPER PRINTING PRESS OF TO-DAY.

II.

A REMARKABLE and not a pleasant feature of mankind, if we come to consider it, is that of glorifying the inventions of the past and vilifying the inventions of the present! The ancient principle of let well alone, that fine old principle that would have left man even without a stick to till the ground with—for why should he worry himself to save his fingers?—is not one to be proud of, and it is one that man never is proud of unless he has a chance of applying it to those alive around him. He will hold the mirror up to Nature: but he will never himself stand squarely in front of the mirror. And therein he is like the dull printers of whom we now make sport.

For many years, both here and in America, the book printers would have nothing to do with the new machinery. And a dozen years ago it would have been decried as impossible to print an illustrated journal from the reel, just as the printers of 1820 proved to their own satisfaction that woodcuts could only be printed with the venerable platen. "What!" said they, "print them in a mangle, with a forme inked with a stick of treacle! Impossible!"

"It was almost the unanimous opinion of the printing trade," says Mr. De Vinne, "even as late as 1840, that really fine woodcut presswork must be done on the hand-press, and on hand-made paper."

Charles Knight was of a different opinion. He was persuaded that it was possible to print woodcuts by machinery; and, encouraged by the Society for the Diffusion of Useful Knowledge, he began in 1832 the "Penny Magazine," which was the pioneer of modern illustrated journalism.

The machines on which the "Penny Magazine" was printed were the same in principle as that in Nicholson's 1790 patent; and the Wharfedales, Bremners, and other machines on which is printed most illustrated work to-day only differ from them in detail. The forme, in which the illustration is set,

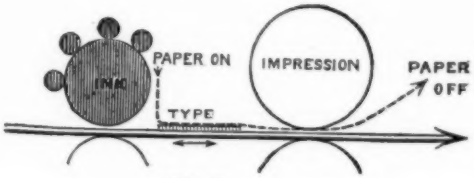


FIG. 5
NICHOLSON

remains flat, it is inked under rollers as it travels, the paper is fed into the machine in separate sheets, and a cylinder running in one direction or in alternate directions presses the paper on the forme as it travels under it and obtains the impression; while in perfecting machines—that is, in machines printing on both sides of the paper—there are two impression cylinders, and the other parts are duplicated.

Admirable as are these machines—and the best of work is done on them—it is evident that for periodicals running long numbers they will soon be replaced by the rotary press. The great difficulty has been to curve the blocks from which the illustrations are printed. To curve a stereo of type is now easy enough, but to bend an illustration without distortion is a more difficult matter. Mr. Ingram of the "Illustrated London News" has minimised this difficulty in a very ingenious way. In his machines he prints his unillustrated forme on a cylinder of the usual news diameter, but the outer forme—that which prints the other side of the paper on which the illustrations come—is of double the diameter of the other. This cylinder has two sets of formes, and travels at half the speed of the first. Two impressions are thus obtained from the first forme before the paper takes the double impression from the second. The curve of the illustrations is consequently very flat; and this idea has been further carried out in the new Marinoni, such as was introduced into this country to print "The Girl's Own Paper," and is now, with the Middletons, printing the "Daily Graphic," wherein the cylinders all carry a double set of plates.

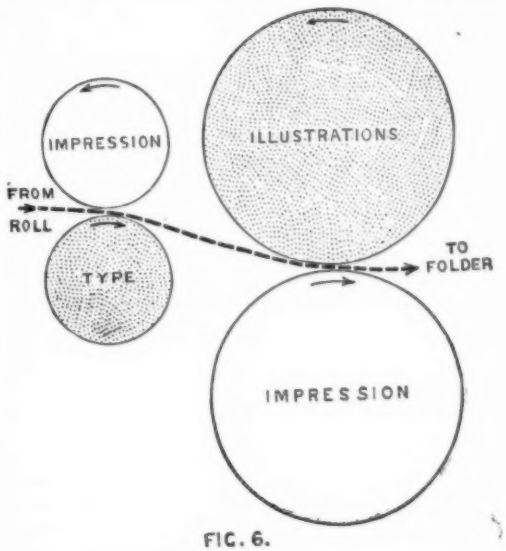

FIG. 6.
INGRAM.

The illustrations are all printed from stereotype or electrotype. They are prepared in many ways. They are drawn on the wood and engraved; or

they are drawn on paper and photographed on to the wood and engraved; or they are drawn on paper and transferred to a printing block by means of one of the many processes; or, where great fineness of line is required, they are engraved on wood and then reduced by process on to the blocks in the way that has been adopted for some time by "The Century" and other American magazines.

In the old style of wood-engraving the subject was drawn on the wood; in the new it is photographed on to the wood, and the original drawing remains as a guide and check to the engraver. This photographing is managed in several ways, but we will only take two as examples. Something more is required beyond merely making a photograph. The boxwood block consists of many blocks all screwed together, for, owing to the cutting being made on the upright fibre, single blocks large enough are seldom procurable; and if this compound block be made too wet it will become uneven, and spoil. Again, nothing must be put on its surface which will clog the engraving tool or make the cutting more laborious; and again, whatever chemicals are used must not make the wood rotten or friable, for, if so, fineness of line is impossible.

In one method, then, the drawing is placed in front of a camera, a negative is taken of it, and from this a clear thin positive is obtained, also on glass. This is toned and fixed as if it were a transparency, and then soaked in a weak solution of sulphuric acid to loosen the film. A piece of wet albumenised paper is laid on it, and when pressed brings the film off safely, to be transferred to the wood block and left till it is dry enough to be cut into.

One more method will suffice. The block receives a layer of white colour, which has been mixed with a solution of gelatin and water. A solution of red prussiate of potass and water is mixed with a solution of ferric citrate of ammonia and water, and this mixture is made and brushed over the block in the dark. A negative of the drawing is taken in the usual way, and this is placed over the block, which is then subjected to the action of the light. In less than a quarter of an hour the block is returned to the dark room, and there washed with a wet sponge, when a beautiful blue picture is revealed on it. Had a salt of uranium been used the picture would have been red. Should the image be too dark, a few drops of sulphuric acid soon lightens it up.

The engraver cuts down into the wood, leaving only such parts of it as he wishes to print from. If the drawing is one in line, the lines he leaves are those of the artist, and consequently where the lines cross he has to cut out minute lozenges; but if the drawing is in wash, or if the original be a photograph of a picture or some natural object, he has to work in the manner he thinks best to obtain the effect.

Proof impressions are printed on a hand-press, but in these days the wood is not further printed from. It is used merely as a source of electrotypes. A squeeze in wax or some such substance is taken from it; the mould so produced is dusted on the inside with plumbago, and attached to the zinc pole of an electric cell, of which the other pole is a copper plate, and when the electrical action is set up the transference leads to a fine deposit of copper in every hole and corner of the dusted wax, which deposit is necessarily a facsimile of the engraved portion of the block which yielded the squeeze. The copper electro thus produced is mounted type high, and becomes the block from which the printing is made.

But wood-engraving no longer flourishes as it did. It is an art requiring two artists—the draughtsman and the engraver, the more mechanical of the two having the last, and most important, word. In this it is at a disadvantage, and in another respect it is unfavourably situated, for when good work has to be done engraving is not cheap. No wonder, therefore, that it is being superseded by the "processes," which cost less, and require no middleman.

These processes are nearly all photo-mechanical, and most of them are based on the discovery that a colloid substance such as gelatin, starch, or gum, when mixed with an alkaline chromate, such as bichromate of potass or ammonia, and exposed to the light, becomes insoluble in water. Ordinary gelatin swells in cold water and dissolves in hot. Treat it with bichromate, expose it to the light, and then wash it in cold water. Where the light has fallen, there will be an irremovable film of hardness; and where the light has been stopped from falling, the bichromate will soak out, and the gelatin swell. But wash it in warm water. Still the film of hardness will remain, but the rest of the material will simply disappear in solution.

The way in which this discovery can be utilised is easily intelligible. A negative is taken of a drawing, and in it the lights and shades are of course reversed: where the drawing is dark, the negative will be light; where it is light, the negative will be dark. The negative is laid on the prepared gelatin, and exposed to the light, when another reversal takes place, for where the negative allows most light to pass the thicker will be the hardened film beneath. In this way the gelatin slab is split into two layers, a soft unaltered one and a hardened one, with the elevations extending downwards away from the negative, just as the ice on a sheet of water is thickest where the cold is greatest; and the gelatin has only to be turned upside down and washed to have its soft layer cleared away, and leave a relief which can be printed from to obtain such effects as in the collotype, where the photographic origin of the print is unmistakable.

The turning upside down is not necessary where there are no half tints, or where the half tint is obtained by a "texture." In 1841, when Joseph Dixon wished to copy bank-notes in America, he mixed gum arabic with bichromate of potass on a lithographic stone, and exposed the sensitive surface to the action of light through the bank-note he wished to copy. Where there was ink on the note, the gum remained unaltered; where the light passed through the paper, the hardening took place; and all Dixon had to do

was to wash away the unaltered gum, and ink the stone and proceed as in lithography.

With regard to this alteration of bichromatised gelatin an important discovery was made by Paul Pretsch. He found that the surface of the less exposed parts was covered with a multitude of tiny crape-like markings or folds, due to the strains that were set up in the mass resulting in interlacing folds and fissures. By utilising these markings he secured his half tints for letterpress printing. After exposing and soaking he had a film with high lights raised and smooth, with middle lights raised and grained, and with blacks deepened and smooth. Of this he took a cast, and then by a double electrotyping he got his printing surface.

Half tints have been the difficulty of all process inventors. For fast machine printing it is indispensable that they should be obtained in some way from a surface which, like type, is all on a level. Satisfactory results can only be had from blocks in which the modulations of light and shade depend on different thicknesses of line. A block dependent for its "greys" on different degrees of depression would soon yield nothing but a smudge. What is wanted is a "discriminating tint" giving thickness in the blacks and fineness in the half-lights.

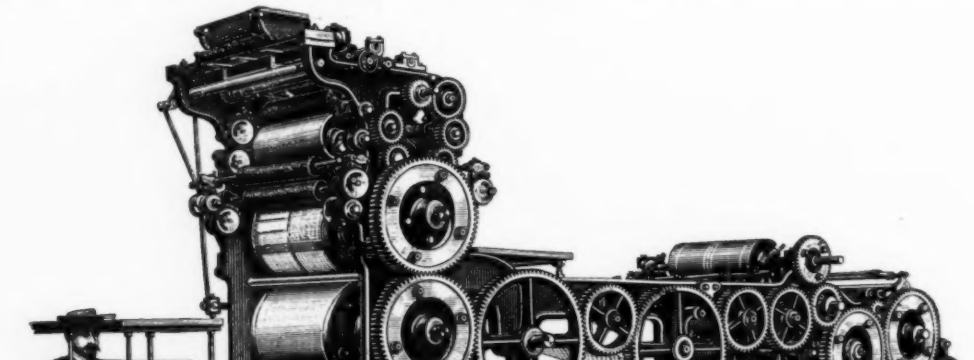
One process arrives at the tint by a combination. A transparent plate is hatched or stippled in parallel lines, or rather a screen so hatched is photographed on to the plate; a transparent positive is made of the drawing; the two plates are then placed together, and from them a negative is photographed in the ordinary way; but in the camera the lined negative undergoes a certain amount of shifting in order to cross-hatch or break the lines and give the discriminating grain. This shifting is the secret of the process, and the only thing for which novelty is claimed in the patent. In fact, the notion was not new. But if we diverge into patents our task will be endless. Let it be said once for all that most of them are worthless, and that the only protection is in some trivial secret of manipulation.

There are other grain processes besides this one. There is one in which a grained glass is used, which has given most beautiful results even for fast newspaper printing. There is another in which glass powdered to flour is used; there is another in which dust is thrown up in front of the negative while it is in the camera; and there ought to be one in which the air-brush is used, if only someone would think it worth while to do so.

We may divide the ordinary newspaper printing processes into two groups—one being photo-relief, the other zinc-etching.

In photo-relief the sensitised gelatin is hardened by the light, as we have said, so that the lines left in the shaded soft compound can be washed out, and the depressions accentuated by the swelling of the mass beneath the hard film on either side. Of the slab thus washed a wax cast is taken; the wax cast gives a plaster-of-paris mould; and the mould gives the cast in stereo metal.

In the zinc-etching systems the gelatin is spread on the zinc, and when the negative is removed the slab is washed and inked; it is then cleaned to clear away the ink that is not filling the depressions; and then it is placed in an acid bath to be etched. The hardened gelatin is bitten away on each side of the inked lines, and would be bitten away beneath them were not steps taken to prevent it. Powdered resin is dusted over the plate so as to rest on the inked ridges and roll down their flanks and protect them, but only so much resin is used as will remain on the flanks without reaching the valley between. Another etching is then given, and in this way the ink is borne on sloping ridges with V-shaped troughs, the troughs being of course very shallow, and sometimes being made more shallow by the ridges receiving a final planing. It is often noticed by artists that when a drawing is reduced by process the thickness of the lines is not reduced in proportion to the reduction of the drawing, and it is almost as frequently answered that the statement is absurd. But it is true nevertheless, for the lines in the process-block can be thickened in three ways—either by the final planing or by the dusting on of the resin or by the coarse grain of the zinc.



Drawings for these photo-mechanical processes have therefore to be made with specially fine lines, or they can be photographed on to wood first, cut finely, and then reduced on to the gelatin. But all drawings will not photograph satisfactorily, for care must be exercised in the choice of pigments. Yellows will turn darker in the photograph and blues will turn lighter; consequently the most fitting colours are the pure blacks and greys. Many draughtsmen for process mix their colours like Reynolds did—with brains and prejudice—but in one quarter, at any rate, the secret seems to be that there is no black like lampblack, except it be lampblack with a little gamboge to give it depth.

"Process" is, however, a wide term. Some of the processes used by our newspapers are not even photo-mechanical, the effects being produced by an eidograph or pantagraph scratching in wax on zinc to be etched, or in wax or plaster-of-paris to be electrotyped or stereotyped from. Some are ordinary photo-zincographs, drawn on prepared paper and transferred full-size to the metal. But such rough-and-ready methods are evidently doomed. Every month the photo-mechanical processes are improved; and if they could only be got to give a deeper, sharper plate, so as to be workable by the ordinary printer (who is always so free with ink in the wrong place), it would be time to write the epitaph of the last of the wood-engravers, who may possibly be said to have died of bichromatised colloids.

Let us return to our main road with the electrotype from the wood, or the block from the process. The block is then set with the type, and a careful cast is taken from the forme as in ordinary news-work, or curved electros of the cuts are fitted in.

But illustrated work differs from ordinary news-work in one important particular. In a mass of type of the same size the pressure is even, but

where there are blocks with much black in them or much open work, the resistance is uneven, and the pressure consequently varies. The black blocks resist more than type, and open blocks hardly resist at all; and thus cuts with much contrast of light and shade require much more pressure in some parts than in others, and to print a cut properly the pressure must be in proportion to the resistance.

THE MARINONI ROTARY FOR ILLUSTRATED WORK.

The way in which this result is obtained is called overlaying. Thomas Bewick, of Newcastle, the father of modern wood-engraving, is said to have introduced overlays; but this cannot be true, for there are marks of unequal pressure in several sixteenth-century prints. Bewick, too, is said to have been the first to lower his blocks a shade where he wanted a delicate tint; but the dodge is at least as old as Holbein's "Dance of Death." He also is said to have been the first to cut on the columnar fibre of the wood; but that practice was recommended in Papillon's book when Bewick was six years old. However, he may have been the first to use all three contrivances together; and as to the overlaying, he certainly seems to have independently invented it or revived it after a long interval.

The practice is somewhat of an art or mystery, but its principle is clear. The printer cannot decrease the ordinary pressure, but where blackness is wanted the pressure can be increased by thickening the cylinder, and the cylinder is thickened just at the spot required by pasting pieces of paper on to it. These pieces of paper have to be of a peculiar shape, and the shape depends on the subject. Three or four impressions of the cut are taken on thinnish paper. These impressions are not like artists' proofs, in which the ink is modulated, but they are hard, crude pulls, showing what the cut would look like if left to itself; and the printer's object is to arrange his overlays so as to make the impression worked off the machine look as much like the artist's proof as he can manage. With a

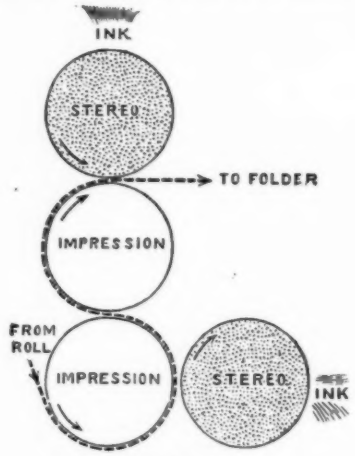


FIG 7
MARINONI

pair of scissors he snips out of one of his flat pulls all the light shading and fine work. He then snips away from another pull everything but the deep blacks. He then snips another pull so as to leave the blacks and the half tints. And with another he may leave a little more of the shading. He may even make six overlays, or—and it is better if he can so manage it—he may do with three. He then pastes these together one over the other so as to make the thinnest possible pad on the cylinder, and when they are dry he takes a proof impression, and trims the pad till he has it correct, giving dark where dark should be, light where light should be, and every intermediate tint, but without clogging a line in the dark or losing a single dot in the lightest work of the original. By this slight patch on the cylinder he will probably have attained at the point of greatest resistance a pressure of a thousand pounds on the square inch, whereas in the open work of the cut the pressure will be no more than that on the body of the letterpress.

In the past it was customary to work entirely with soft packing—that is to say, with a thick blanket or cloth between the impression cylinder and the paper, so as to equalise the printing and allow for irregularities in the height of the type. With "soft packing" the overlays were often very numerous; but nowadays we have changed all that. Our first-class illustrated magazines are printed by the "hard packing" system, in which the impression is given from an almost unyielding surface. In another point we have improved: we calender the paper and print on it when it is dry. In many of the news machines, as we have seen, the paper is still damped, chiefly because it is so poor and common, but in illustrated rotary work the paper is printed on as it comes from the mill.

In the new Marinoni we have a machine printing with hard packing on dry paper at the rate of 7,000 copies an hour. The cylinders, each of double size, are arranged in the shape of an L, the two impression cylinders in the middle, with a type cylinder on the top and a type cylinder alongside the lower impression one. The paper passes through a smoother, and enters at the very bottom of the machine; it passes upwards as it takes its first type; runs outwards and upwards round the upper impression cylinder; and after receiving its second printing drops down into the folders. There are no tapes, but there is a gathering drum with grippers, which takes four sheets at a time. And before being cut the web passes through some six or seven feet of space, so as to have just the fraction of a moment to dry. One peculiarity of the machine is the set-off arrangement, which consists of a full width web of paper running off one spindle on to another round the outer forme cylinder underneath the web which is being printed.

As with the other rotaries, the saving of labour is enormous. Work which with a cylinder machine would require twenty men can by it be done with three. It can turn out 2,600 copies per hour per man. Forty years ago the Lightning, as we have seen, yielded 420 copies per man of an ordinary unillustrated sheet. Now our Walters turn out occasionally-illustrated sheets at the rate of 3,140 copies per man, and our Quadruple Hoes have brought the average over 5,000.

There are two main causes for the cheapness of our newspapers. Thanks to new materials, new machinery, and no duty, the paper costs but a quarter what it used to do; and though rotary presses at £7,000 apiece require a somewhat alarming sinking of capital, yet so great is the saving of labour that with higher individual wages the mere printing costs not a tenth of what it did in the days of the Lightning, and not a hundredth of what it did at the time of Nicholson's Patent a hundred years ago. W. J. GORDON.

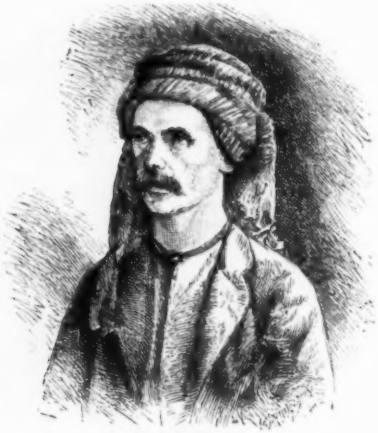
## March Winds.

THE wild March winds are up and away,
Threading the streets of the dusty town;
The little ones laugh to hear the fray,
Thinking of Spring and her violet crown;
Thinking of Spring, who bravely stands,
Waiting under the sheltering hills;
They know she is ready to fill their hands
With primrose stars and with daffodils.

The wild March winds are up and away,
Bound for the moor and the rocky bluff
They've many a cheery word to say,
Though it be told in a voice so rough.
Waken, oh, bleak and dreary wold!
Soon will the rapture of summer come:
And over your mantle of purple and gold,
The sunbeams shine and the brown bee hum.

The wild March winds are up and away,
Crossing the furrows and fields forlorn;
They shout as they go of a happier day,
Fruitage of autumn, and goodly corn.
Then at the sound of their boisterous mirth,
Thrills the seed, until wondrous Life
Has a bout with Death in the heart of earth,
To rise a conqueror from the strife.

And thus, my soul, must it ever be,
Long as the circling seasons run;
Grim Death for a watchful enemy—
Life but in rigorous conflict won.
Blow, thou Spirit of Power and Might,
Darkness Thy fair creation binds;
'Twill fly at Thy word, as the wintry night
Before the breath of the wild March winds.



SYDNEY GREY.

# ITALIAN EXPLORERS IN AFRICA.

BY SOFIA BOMPIANI.

THE name of an Italian explorer, Giovanni Casati, is now indissolubly connected with that of Emin Pasha, of whom he was the companion in the wilds of Africa. Their dangerous situation, shut in for years between rebellious Soudanese and ferocious and cruel tribes in the south, excited the sympathy of the civilised world. The long silence which followed Stanley's relief expedition into the Dark Continent, no word coming from him or from Emin Pasha, or from Casati, seemed ominous of disaster. They were all mourned as lost or dead, and tidings of their dreadful end were daily expected. But the cloud lifted; Stanley was successful in reaching them, relieving their wants, and bringing them, almost against their own will, back to home and friends, to honour and fame.

Casati, who was the counsellor of Emin Pasha, has reflected honour on the Italian character. Stanley says, "Questions of law, honour, and duty were brought forward by Casati, who expressed himself clearly that 'moralmente' Emin Pasha was bound to stay by his people." This fidelity of the heroes to their trust was not the least of the difficulties encountered by Stanley in saving them. But when it was proved that few of their followers remained faithful, even Casati was convinced, and yielded to the counsel and persuasions of Stanley.

CAPTAIN CASATI.

Captain Casati was born in 1838 at Monza, near Milan. He was a soldier in the war of 1866, and afterwards, in the suppression of brigandage in Southern Italy, and wherever he went, gained the esteem of those who knew him.

In the year 1879 he left Italy, and with limited means went to Africa to join Romolo Gessi, on the Bahr-el-Gazal in destroying the slave trade. From Khartoum, a month's journey up the Nile brought him to Gessi Pasha, who received him more as a dear relative than as a subordinate officer, and nursed him through a violent fever which followed immediately. After one month and a-half spent thus together, Gessi left for Khartoum and the Nile, on that fatal journey when his ship, the Safia, was locked for months in the arms of aquatic plants and five hundred of his people died from famine, as he himself also did on arriving at Suez. Casati then alone made long and difficult explorations to Niam-Niam, Bamba, and Guruguru.

For one year nothing was heard from him. Then came a letter. Then another year of silence, and another letter; and from 1883 to 1886, three years, not a word was heard from him nor from Emin Pasha, whom he had joined. He found the grave of Miani at Tangasi, under the tamarind-tree. He studied the course of the river Uelle; visited the Sultan of Mambanga; was taken prisoner by the Sultan Azamga, but escaped to Sultan Ghirimbi, who protected him. He then went to Bakangoi, crossed Monbutù, and found refuge at Ladò with Emin Pasha.

He took part with Emin Pasha in the long resistance made with a few Egyptian soldiers to the Soudanese, who drove them continually farther south. The relief funds collected for Emin were also for the liberation of Casati, and Stanley, on leaving Italy for his adventurous search, said, "I go as much for Casati as for Emin."

The Italians naturally thought chiefly of him. The African Commercial Exploration Society of Milan received subscriptions for him, and Giacomo di Brazzà and Antonio Pecile, on their return from the Ogowè and the Congo, offered their rare collections to the Government for a sum destined for the relief of Casati.

The return of Casati and Emin to the civilised world was greeted with joy, and such an ovation was offered them by Emperors, Kings, Queens, and Governments as was never before received by any travellers.

They were faithful to the trust given by General Gordon as long as it was possible to be so, and then followed their preserver Stanley on foot through unpathed dark forests, crossed new rivers, found new lakes, until they saw at last the cross on the steeple, and all the delights and comforts of civilised life. Casati, worn out with the fatigues of the journey, received at Zanzibar the congratulations of the Roman Geographical Society, which offered to pay the expenses of his return to Italy. He has been greeted as a brother returned from the dead—one lost and found.

The interest awakened by these events affords a favourable opportunity for returning to the subject of African exploration, and giving some

further account of Italians who have borne a share in it. In previous papers we recorded the achievements of some of the most distinguished.[1]

Let us now begin with one of the most remarkable characters of the Roman Church—the Capuchin monk Cardinal Massaja, who died near Naples in August last.

CARDINAL MASSAJA.

I have myself seen him of a summer day—a venerable man with a thick grey beard, dressed in the brown cloth gown of the Capuchin friars. He was seated in the garden of the Villa Ruffinella at Frascati, and surrounded by a number of the young priests residing in the college.

When near his eightieth year the order came to him from his superiors—and such commands neither age nor infirmity can resist—to write a history of his years spent in Africa.

The task was difficult, not only on account of his advanced years, but for want of notes, all his writings having been lost in the various exiles that he suffered from the seat of his mission. Yet Massaja has written from memory, and such other aids as he could procure in Rome, a work of seven volumes, which is illustrated by numerous engravings.

A large part of these reminiscences relates exclusively to his monastic character. Vigils, fasts, the celebration of masses, the recitation of the rosary, the improvising of chapels in upper rooms by covering wooden boxes with red cloth, and all the many forms and ceremonies of the ascetic life occupy much of the work. He gave little attention to the natural sciences, except in the first years of his missionary life in Africa, when he had little communication with the natives from ignorance of their languages, and time remained for these studies. He considered them extraneous to his mission, and time devoted to them as a betrayal of "God, the Church, and souls."

Monsignore Massaja, however, made use of a scant acquaintance with medicine and surgery which he had acquired when chaplain of a hospital at Turin. This, especially his skill in vaccination, procured him the good-will of the natives, and aided his missionary efforts.

Guglielmo Massaja was in the year 1845 teacher of theology in the Capuchin convent near Turin. At least ten years before he had expressed a desire to become a missionary in pagan lands, but, absorbed in his regular duties and verging on mature life, he had almost forgotten this aspiration of his youth, when he was one day informed by his superiors that he had been selected for a difficult mission to Africa.

At Rome, before sailing for Alexandria, he visited Gregory XVI, then on his death-bed. He was a great admirer of this Pontiff, of whom, on the contrary, the Liberal Italians retain most bitter memories.

For one reason or another all his movements were made in secret. He slipped away secretly from his scholars at Turin; he sailed from Europe in secret, and in secret travelled over Abyssinia to reach Galla. Dressed as an Arab merchant, under the name of Antonio Bartorelli, he passed through the diocese of Abba Salama, the native Bishop of Abyssinia.

In this journey through Abyssinia to Tigre, which lies beyond, the Roman Catholic Bishop often traded or even slept with those who were in search of him; and Abuna Messias—the name given him by Abba Salama—was unrecognised in the coarse dress and uncut beard of the wandering merchant. Once he was drawn up by a rope over a precipice to pass the night in safety in a hidden grotto. He crossed the rivers on square rafts, pushed forward at each corner by a negro in the water, or tied to a double rope, which a band of natives moved slowly around from hand to hand. Arrived at last within sight, from the top of a mountain, of the Galla land to which he was appointed missionary, Massaja declared he felt the joy of the Israelites when near the promised land. When, by crossing the last river, he actually stood upon it, he dropped the merchant's dress, arrayed himself in the brown Capuchin robe, and, with his companions, fell on his knees to chant a Te Deum.

He was not without adventures with wild beasts. One morning before daylight, as he walked alone in advance of his companions to recite his prayers, through a bamboo thicket on the crest of a hill he heard the soft step of a leopard as it trod over the fallen leaves. He wrapped himself from head to foot in a large piece of linen that he had with him, leaving only room to look out, while he clasped the cross closer, and began to bless himself and recommend himself to God. While his heart beat like a hammer, he saw the leopard turn when it came near, look fixedly towards him, and then pass on.

He once ran out of a burning prairie followed by a train of wild animals—leopards, antelopes, and serpents—that sought, like him and his companions and their faithful *asinello*, to escape. The donkey had his legs and tail burnt, and a large serpent, although it made prodigious leaps forward and upward over the burning reeds and plants, fell at last into that furnace, and was consumed. The natives are accustomed, in order to

[1] Antinori, Cecchi, Chiarini, Gessi, Matteucci, Miani, Piaggia, Savoiroux, Savorgnan di Brazzà. See "Leisure Hour," 1888, pp. 526, 590, 692, 749.

clear the prairies of serpents and animals, and also to prevent the vegetable matter from decaying after the rains and producing miasmas, to set the dry grass and shrubs on fire, keeping themselves out of its track. But that day the wind blew towards Massaja, who escaped from the fire with great difficulty.

He was nearly drowned in the night, at another time, by one of those terrific river floods that come sweeping down from above, and in a moment carry away man and beast and tree. He had chosen for the night's rest an island in the river, upon which was a large tree. This served as a refuge when the flood came. After eating his frugal supper, "having still many prayers to recite," he let his companions stretch themselves on the sandbank to sleep while he watched and prayed. His prayers ended, he stretched himself on the sandbank to sleep, but was soon awakened by thunder and lightning and the rush of waters, which compelled them all to mount the sycamore-tree. The island was soon covered, and the patient ass tied to the tree floated for hours with only his head above water.

At another time, when he had taken refuge under a fruit-tree during a storm, the fruit came beating down like stones upon him.

After his first journey to Abyssinia Massaja returned to Europe, visited France and England, made visits to Lord Palmerston in London, and to Mahommed Ali in Cairo on his return. And ascending the Blue Nile to Khartoum, he hoped to reach the Galla land from that side without passing through Abyssinia. But the mountains and the people both opposed him, and rendered it necessary to return by the Nile to a point where he could enter Abyssinia.

A visit he made on this journey to Galla, while in disguise, to a shepherd people called Zellàn, in the mountains, is an idyll. He there reassumed his missionary character, and taught those simple minded country people religion as he understood it; and they became so attached to him that they all wept when, after three weeks, he prepared to depart.

Massaja founded during his long sojourn in Africa numerous missionary stations in Galla, and also in Shoa, where he became the friend and adviser of King Menelik.

Another missionary, Pasteur G. P. Weitzecker —a descendant of the Waldenses, who kept the faith of old so pure in Italy, and whose bones lie scattered over "the Alpine mountains cold"—still labours in South Africa. The Synod of the Waldensian Church, which meets annually at Torre Pellice, in the valleys of the Cottian Alps, was surprised in 1883 by the request of one of the pastors for a leave of absence of ten years. Pasteur Weitzecker proposed to take the place in Basutoland, in South Africa, of the French missionary Coillard, who has since gone forward to the Zambesi river.

The Synod, although reluctant to spare one of the few Waldensian pastors who evangelise Italy, consented, not a little proud at the same time of sending out its first missionary to pagan lands.

Early in the following year Weitzecker and his wife went out to Africa as missionaries of the French society, first, however, making a tour through Italy to salute their friends and make collections in favour of their future work. The collections were small, as the congregations of Italy are poor, but the people listened with fervent interest to his accounts of the country to which he was going.

The long journey by sea safely accomplished, the two travelled overland in heavy carts to Leribe, the station in Basutoland.

PASTEUR WEITZECKER.

The details of their work there have been full of interest, but we need not enter into them, as the ground is already familiar to many readers. Mr. Weitzecker has presented to the Ethnological Museum of Rome a collection of the musical and agricultural instruments, and of the weapons of war, ornaments and clothes of the Basuto people. This collection is highly prized by the Italian Government, which has conferred upon him the title of Cavaliere. He writes often for the bulletin of the Roman Geographical Society, of which he is a member, and was sent at the expense of the society to visit the Italians living at the diamond mines at Kimberley.

Count Pietro Savorgnan di Brazzà, although in the service of France, was born in Italy, which he left at thirteen years of age. He now calls himself a Frenchman, but his father, mother, and several brothers are Italians, and live in Rome.

While attached to the naval station established by the French Government on the deserted coast of the Gaboon, to prevent the slave-trade, Pietro Brazzà in 1874 made an expedition up the river Ogowè. Before him, Paul Du Chaillu had suggested that the numerous small rivers by which the Ogowè pours its waters into the Atlantic came from a large stream above, perhaps connected with the central lakes of Africa; and in 1862 had followed on foot one of the tributaries of the left bank.

Two officers of the French Marine afterwards ascended beyond the delta, and proved the existence of this great river.

It remained for Brazzà, in several bold explorations through the lands of cannibals, often the only white man of his party, and without shoes,

to ascend the river to its sources, and cross on foot over the few miles that separated them from the sources of another river (the Alima), which afterwards empties into the Congo. All this territory, a splendid acquisition, he has placed under the dominion of France. He proved that the Ogowè was not the same river as the Lualaba, about that time discovered near the Lakes, the outlet of which was then unknown, but which was afterwards seen to be identical with the Congo.

Chiefly at his own expense, but with some aid from the French Government and scientific societies, Brazzà, after a year of preparation, set out up the river, with ample supplies of salt, guns, beads, knives, and razors—objects which take the place of money with the savage tribes. He had with him three Europeans, thirteen black Mahommedans from Senegal, four interpreters from the Gaboon, and a cook, whose talent, however, served little, as Brazzà carried with him only biscuits, rice, coffee, sugar, sardines, chocolate, and other prepared food.

He was conveyed by a French steamer to Point Fétiche, beyond the delta, and there kindly received by old Renoqué, the most powerful chief on the river, who was eager to have commercial relations with the mouth of the Ogowè.

Brazzà there embarked with his company on four long boats adapted to passing the rapids. The banks of the Ogowè are peopled by various tribes, often at war with each other, who exact heavy tribute from white travellers.

The Osseyebas are cannibals, who fortunately, however, care little for the flesh of white men, but highly appreciate their merchandise. The Apingis acted as wreckers on the shore when several of the long boats were upset, and they robbed Brazzà of a bale of tobacco and a large part of the heavy goods which he carried. The Okandas above the rapids received him kindly and let him establish headquarters on their land while he negotiated with the Osseyebas and the Adumas for permission to advance into their territory.

Brazzà made acquaintance with Mamiaka, an Osseyeba chief, and leaving the Okandas, in company with only three men he went forward into this unknown country, inhabited by cannibals. But overcome by the fatigue and hardships of the way, and excited by the lies, duplicity, and cunning of the savages, his health gave way, and he returned in a boat to his headquarters.

This second journey up the Ogowè was even more dangerous and fatiguing, but resulted in discovering the sources of the river. The courageous traveller was detained by the treacherous Adumas, who coveted the contents of his boxes. He only escaped from them by bribing with gold the grand Fetish man, or witch doctor, whose power over these superstitious savages is unlimited. He next went up as far as the Falls of Poubara, sixty feet high, where the river divides, and is no longer navigable owing to the frequent rapids and falls. On the banks of the stream he found the tribes of the Okota, the Sciache, the Auangi, the Sebé, the Obamba, and the Odimbo, the latter of whom use the short bow and barbed poisoned arrows.

It was clear at last from these explorations that the Ogowè was not a direct route to the centre of the African Continent; and there was yet an immense tract of unknown country between its sources and the Upper Nile.

How was it possible for him to go forward in this maze of unknown rivers, mountains, forests, and savage tribes, constantly subject to the miasmatic fevers of the country, with heavy baggage, and with bearers who dreaded to leave the river, which was their road home, and often on the way threw down their loads, refusing to go farther? Up to this point Brazzà had travelled through a fertile but unhealthy country, where provisions were abundant and the people friendly. But he had reached the bare rocky mountains and half desert land of the Batékès, a warlike tribe given to pillage, and almost destitute of food.

To replace the bearers he had brought from down the river, he employed slaves, giving them liberty from the first, which they used to desert him as soon as they reached their own tribes, thus rejoining their friends and relatives who had already sold them once as slaves, and would sell them again. To protect himself and his goods from the Batékès, Brazzà, when left with only three faithful men, early one morning buried a box of gunpowder, so that he could blow it up when necessary. This mysterious proceeding so alarmed the superstitious marauders that they called him a Fetish, and left him in peace. On this part of his journey famine was his constant companion, and he learned to eat like the natives white ants

PIETRO SAVORGNAN DI BRAZZÀ.

and grasshoppers cooked in palm-oil, which he soon found very good. Here he discovered the Alima, a river with several tributaries, and his route lay towards the centre of the African Continent.

His progress through their land was opposed by the Apfourus, and he was attacked by the inhabitants of every village, often marching with his few companions through long lines of savages armed with clubs, when a moment of weakness would have been fatal. In the night he heard the beating of drums and sounds from the river shores and the tops of the hills like the neighing

of horses, and saw watch-fires kindled all along the shores. He heard the enemy sing war-songs, the refrain of which was that his flesh would soon be eaten at their festival of victory. He took refuge in his boats on the river, and next day was attacked by thirty boatloads of blacks, who were soon routed by the well-directed fire of his fifteen guns. But the following night Brazzà escaped from this dangerous locality, and crossing, by the light of bamboo torches, a marshy forest, he reached at last some hills, and soon was out of the power of the Apfourus.

He returned to the country of the Batékès, which he found desolated by famine, and even almost without water. He and his two white companions won the good-will of their followers by dividing food and water with them. The Batékès were won, but, sick and without means, Brazzà resolved to leave this inhospitable and enigmatical land. Not until his return to Europe did he comprehend that the Alima was a tributary of the Congo, the great river of Livingstone and Stanley, and that he had crossed the hilly region of about fifty miles between the sources of the Ogowé and the waters of the Alima, there narrow but deep, clear, and navigable for large boats.

The swift and happy return down the Ogowé to the friendly Okandas, where he found new supplies, was almost saddened by a singular accident. The long boat in which was Dr. Ballay, the companion in all these perils of Brazzà, was upset by a huge hippopotamus, throwing out the occupants, and giving them a cold bath and a fright, but nothing worse.

At another time, when a boat containing forty-four boxes full of the merchandise and the stores that were to serve for the journey slipped its moorings at night, and went down the stream, Brazzà ran down the shore barefooted, cutting his feet on the rocks, and leaving his men at certain distances to watch the river. When he had outstripped them all, and walked for three hours, he prepared to spend the rest of the night on the rocks. He built a large fire to protect himself from the cold and the wind, and thought sadly of all the precious things lost; among them his instruments and documents. As day dawned, however, he saw his boat caught among the rocks at the foot of a large tree that grew in a narrow part of the river. He saved it from some thieving Apingis by firing a revolver over their heads, and then persuaded them to aid him in bringing it to land.

After three years of this adventurous life Brazzà went to France; but, soon wearying of an easy life, returned to the rivers and forests of Africa.

With the Osseyebas he crossed dense forests, where the sun was never visible, passing under green domes of leaves and branches, and wading over the brooks and streams when he did not cross them on the shaking trunks of huge trees.

In these long marshes, where even the men of the forest sometimes lost their way, he hung his hammock at evening, when the darkening of the forest showed that the sun had set, and the Osseyebas gathered sticks, leaves, and bark, with which they made huts, beds, and fires.

He gained the admiration and respect of the savages by killing elephants and wild bulls in the forest, which served them all for food, and awed them by his guns and revolvers, his fireworks and magnesium lights. The Adumas discovered by Brazzà are a debased and brutish race. They are destitute of history or traditions, or poetic ideas, even the coarsest. They are cowardly and perverse, and sell their own children, fathers, and brothers into slavery. When they sing together in time while rowing, in order to row together, their songs have no sense or meaning whatever. They considered Brazzà their prey; and, cunning and rapacious, despoiled him whenever they could, although professing to be friendly. They believed that he brought with him in his boxes, the smallpox which then afflicted the tribes along his route, and said, "The white chief is wicked, and carries with him a box full of maladies. When he passes through a village he opens this box and all the diseases fly out, which make our men die."

But, by the care he took of the sick, and the medicines given by his companion Dr. Ballay, he persuaded them of his kind intentions. His rule when among these savages was always to be more severe on himself than on them, and to practice humanity and justice. His aim, he says, rather than to discover new lands or new tribes, was to carry civilisation to these unknown and distant countries. But he often failed in these humane efforts. At one time he found a savage whom he knew in slavery and liberated him, but was surprised that instead of enjoying his liberty and continuing with him the savage returned to the same treacherous friend who had before ill-treated him and reduced him to slavery.

The second journey of Brazzà, from 1879 to 1882, was made at the expense of the French Government, which he had persuaded of the value of this territory. He started for the Congo and the mouth of the river Alima, the upper part of which he had already discovered, at nearly the same time that Stanley travelled on the other shore of the Congo, at the expense chiefly of the King of the Belgians.

The contrast was great between the mountainous, precipitous country where Stanley travelled and the comparatively easy district traversed by Brazzà to the north of the great African waterway.

At the confluence of the Ogowè with the river Passa, Brazzà, in 1880, founded the first French station, and called it Franceville. It was in communication by the Ogowè with the Atlantic, and by an easy overland journey also with the Alima and the Congo.

An embassy came to him from Makoko, the chief of forty tribes. "To the great white chief of Ogowè, whose terrible guns have never served to attack, and whose feet are accompanied by peace and abundance, Makoko sends the word of peace, and hopes to see his friend."

Makoko understood the benefits of an alliance with the white man, and soon placed all his

territory under the protection of the French flag. When the white chief expressed a wish thousands of black men were ready to obey it.

Makoko received Brazzà one day in state. Stretched on a lion's skin spread over the red throne, his wives and children and courtiers, as well as the witch doctor, around him, he awaited the entrance of the explorer. The new ally, on his part, wore his naval costume, with gold buttons and bands, and was accompanied by his brother Giacomo, Attilio Pecile, and other Europeans. Thus, a friendly alliance was concluded with the chief whose power reached to the mouth of the Alima on the Congo.

The forty tributary chiefs of Makoko came—some from the Equator—to meet Brazzà a few days later. It was a strange and imposing spectacle. He was their friend, not their conqueror, and they believed in the protection of the French flag, which was accepted and raised by everyone of them. Yet more than once he was obliged to meet real battles with people of these tribes before he could persuade them of his superior force and skill. Brazzà founded two stations, one on the Ogowè and one on the Congo, Franceville and Brazzaville, which are said to be self-sustaining. By these access is obtained to the upper Congo, which leads to the heart of Africa. Navigation up the Ogowè to Franceville is easy, and the distance across the country to the point where the Alima is navigable is forty-five miles. The distance from Franceville to Brazzaville on the Congo is 180 miles. This is a fertile country and thickly settled. Brazzà recounts that he once stopped with 700 men at a village near evening, and was not only fed, but he started next morning, by paying ninety pounds of salt, with provisions for two or three days.

After the second journey he was welcomed in France with enthusiasm, and received from the Government large subsidies to make roads, improve the stations, and launch a small steam vessel on the Congo at Brazzaville. About seven thousand natives in the basin of the Ogowè are at the service of France to carry weights and row on the rivers. Slavery and human sacrifices are diminished, and this population of five millions are losing their vices and cruelty by contact with civilised men. In ten years 450,000 dollars were expended by the explorer, and his judgment, patience, and endurance were beyond all praise. He is still there, although at one time recalled by the French Government. Italians naturally regret that a man of such energy should disown his country, and lay his life and achievements at the feet of another nation.

## NATURAL HISTORY NOTES AND ANECDOTES.

### MEDITERRANEAN FISH IN THE BRITISH CHANNEL.

MANY reports have lately appeared as to sardines and anchovies having been caught in large numbers, along with pilchards, off the southern coast of England. A more singular capture occurred during last year.

An eminent naturalist, Mr. Crane, F.L.S., who keeps as watchful an eye on the fish-shops at Brighton as the late Frank Buckland did on those of London, saw an unusual fish in Hellyer's well-known shop in Market Street.

"You have got a rare and curious fish here," said Mr. Crane to Mr. Larkin, the successor of the late Mr. Hellyer; "where did it come from?"

"It was caught fifteen miles from Brighton;" and, on being told it was a specimen of a fish never before caught in northern waters, Mr. Larkin presented it to Mr. Crane for the town museum, where it now forms a conspicuous object.

It is a specimen of the *Scorpœia scrofa*, a fish of the family of *Cyttidæ*, of which the John Dory is the most familiarly known species. In fact, the scorpœia in appearance most resembles the John Dory, with high and spiked dorsal fin, but smaller in size, and of a beautiful red colour, brighter than that of any mullet. Within a week the fish was prepared and mounted, with description and a record of the time and place of capture.

By a curious coincidence, a few days after securing this prize for the museum a catalogue of old books on Natural History was sent to Mr. Crane from London. In the list was the great work "Gulielmus Rondeletius de Piscibus Marinis," a large folio, published at Paris in 1554. The book is now rarely met with, but is still a standard work for ichthyologists. This copy, at once secured by Mr. Crane, is a fine folio, in perfect condition; and on turning to *Scorpœia scrofa* an admirable figure of the fish appears, with accurate description by the distinguished author, who gives as its only habitat "Mare Mediterraneum."

The scorpœia of Rondeletius is cited by Dr. Gunther, of the British Museum, in his Catalogue of Fishes, published in 1860 (Vol II, p. 108.)

What has caused the recent migration of Southern European fishes to our seas is not known. It may be from change of temperature, which has during the past winter shown itself on land, as evidenced by the extraordinary number of plants flowering at unwonted seasons. We fear that no accurate observations have been made as to the temperature in the waters of the Channel such as meteorologists have recorded at the various stations on land. It is a subject to which Professor Ray Lankester and his assistants of the Marine Observatory at Plymouth ought to give attention.

Meanwhile a welcome addition has been made to the specimens in the Brighton collection, which is one of the richest and best arranged of all our provincial museums. Mr. Crane has given many years of zealous and generous labour to this museum, and to the preparation of a catalogue containing a description of every specimen in the collection. In this Museum, and in the Reference and Lending Library under the same roof, of which Mr. Madden, a distinguished man of letters, is superintendent, Brighton has advantages possessed by few towns in England; and we trust the citizens will have intelligence and public spirit to support such excellent institutions. J. M.

### ODD FISHES.

I suppose that most of us derive our notions of the finny tribes from those eminently respectable edible fishes displayed on fishmongers' stalls, but only those who occasionally see our fishers drawing their nets or lines can form any idea of the strange creatures which day by day are contemptuously thrown back into the waters as being unfit for the market. One of these odd fish has a huge head and gaping jaws out of all proportion to his small lean body; another is known to the fishers as the sea-pig, and has sharp prickles all down his back, which make him unpleasant to his captors; but perhaps the queerest of these "occasional" visitors is one commonly called "the lump fish," a most grotesquely hideous fat creature, covered with rows of rough knobs, and having on the under side a large hard lump, whence it derives its name. I am told that this fish in the course of its little life undergoes changes as numerous and as curious as, in the fresh-water kingdom, is the development of frogs' spawn into tadpoles and full-grown frogs. He begins life in a tiny egg, and when first hatched strongly resembles the said tadpole, with large head and slim body. In course of time, though still large-headed and smooth-skinned, he is duly provided with fins. In his last transformation he becomes the bloated creature I have described, with head and fins alike buried in fat, and his whole body covered with coarse rough tubercles.

But of all marine oddities surely the most eccentric family are the flat fishes, with their ludicrously twisted faces. Poor things, they seem conscious of their ugliness, for instead of swimming about gaily like other fish, they go wriggling along beneath the sand, and only reveal their presence by an occasional shuffle. Indeed, I think no one can look at the face of a flounder without marvelling why a whole race so eccentric should have come into existence. Strange to say, the fishers on our Scottish east coast have precisely the same legends as the Germans to account for this peculiarity—namely, that the flounder was doomed to have a crooked face to all eternity as a punishment for having rudely mocked some other fish, and made faces at it as it passed!

The extraordinary thing is that all new-born flat fishes, though shaped something like shillings, are perfectly symmetrical. For the first week or so of its baby-life an infant sole or flounder swims vertically, like other fishes; its two sides are alike, and it has an eye on each side of its head. The baby sole, hatched on some sandy shallow, and transparent as jelly, starts as a rover, travelling where fancy leads him in the free open sea. Very soon, however, it seems to realise the dangers of unprotected travel amongst numberless foes, who are well protected with offensive weapons in the form of strong jaws and sharp teeth, while the poor soles, flounders, brill, plaice, rays, skates, and other flat fish of all sorts are singularly defenceless. So, obedient to the dictates of prudence, the travelled sole returns to the sand-bank where it was hatched, and there, the better to conceal itself, lies down flat on one side (generally on the left side), and so continues to the end of its days, burrowing in sand or mud. Never again does it swim upright in a brave, independent fashion, but flaps and shuffles along on one side as if its whole object in life was to escape observation.

And Nature—pitying mother—helps it to elude its foes by adapting its colour to that of the ground on which it lies. No longer transparent, as in infancy, its under side now becomes of a dead opaque white, so that when it must rise in search of food and air it may be the less conspicuous to other fishes looking up to the light. At the same time the upper side assumes the colour of the bed on which it chiefly rests. Flounders, which delight in the muddy estuaries of great rivers, become mud-coloured; while soles, which prefer sand-banks, are spotted with sand-coloured marks on a dark ground. Plaice, which most commonly lie on gravelly beds, are covered with bright coloured spots, which might easily be mistaken for wet pebbles. So, too, are the turbot, which are also covered with raised lumps, so as strangely to resemble the shingly banks on which they generally rest. It is even said that some varieties of flat fish have the power of changing their colour at will, so as to match their surroundings, and thus more effectually conceal themselves.

For the same reason soles are able to adapt themselves to the very form of the ribbed sand on which they lie, following its lines the more closely by means of the fringing fins which encircle them, and which they partially bury in the sand.

But the most remarkable point in the transformation of these creatures is the independent line of action adopted by the eye, which, when its owner takes to swimming, or rather wriggling along on one side, finds itself always buried in sand. Objecting to this treatment, it first works its way forward on the under side, and then gradually travels upwards, looking about it all the time, till it finds itself opposite the other eye, but of course, like the rest of the queerly-twisted face, it is all on one side. There is, however, one branch of this family in which the locomotive eye, while leaving its original mask and socket apparently unchanged, gazing at the sand, really closes itself for awhile, and, taking a short cut straight through the head, reappears on the upper side, and there remains. For awhile the under eye retains such a natural appearance that a casual

observer would certainly assume the creature to be possessed of three eyes.

The family has not arrived at unanimity of opinion as to which is the most comfortable side to lie upon. Most of its members lie on the left side, their coloured side and correctly placed right eye being uppermost. But brill, turbot, halibut, fluke, and megrim lie on the right side, which becomes white, while the left side comes to the surface, and its eye looks straight. But individuals vary in their ideas of comfort, and occasionally a sole lies on the left side and a turbot on the right.

I should mention that these remarks do not apply to the ugliest of all flat fish—the skate, and other members of the ray family, which is not related to the flounder, being a sort of flat dog-fish, and symmetrical in its structure, with an eye on each side of its face. Its ugliness is, however, so fully recognised by the people that to address a person as a "dun skate" is a climax of north country abuse!

While speaking of flat fish, I must not forget to mention a curious prejudice against their use as food which till very recent days prevailed among the Celtic population of Scotland. Indeed, that it is not yet fully conquered may be gathered from the statement of a fisherman of the Isle of Lewis, who, in giving evidence before the Royal Commission, remarked that he and his comrades "often caught turbot on their lines, but they used them all for bait!" On being asked whether he was not aware that turbot commanded a high price in the London market, he replied, "Yes, but London is far from here!" Considering all we hear of the poverty and starvation of these islanders the force of prejudice must be strong indeed!

It certainly is a very remarkable survival of the old Celtic detestation of scaleless fishes, an objection quite in keeping with the Levitical law, which commanded that, "Whatsoever hath no fins, nor scales, in the seas and in the rivers, of all that moveth in the waters, that shall be an abomination unto you." (Lev. ii. 10.) So real has this feeling proved that till very recent years the poorest people would not eat these despised dainties; and even on the coast of Fife and Aberdeen fine turbot fit for any alderman's feast were thrown away, as there was no sale for them till the Saxon came north.

Scotch fishers in general have not learnt wisdom so far as supplying the market is concerned; but the purchaser requiring a turbot on the east coast must remember to ask for a roden-fluke or flounder, for should he ask for turbot he will be served with halibut, which is a very coarse fish of the same family.

Of the terrible waste of good fish where these are rejected we may form some idea by considering the enormous size attained by many of these. One halibut captured at Wick was found to weigh 231 lbs. Another taken off the Northumbrian coast weighed 294 lbs. But when we look to America, where everything seems to run to size, we find that halibut have been captured weighing from 400 lbs. to 600 lbs.! One weighing 475 lbs. was exhibited in the Canadian Court at the International Fisheries Exhibition, preserved in a plate-glass refrigerator.

In like manner the skate of foreign lands is sometimes a very magnificent edition of our modest fish. For instance, one was caught in Ceylon in the spring of 1884 which measured seventeen feet across and fifteen feet in length (including the tail, which accounted for five feet). Its body was three feet in height, and its great gaping mouth was three feet wide. Such was its muscular strength that two boys who rashly stood on one of its great flapping fins, under the impression that it was dead, were tossed in the air like tennis-balls!

But irrespective of such monsters as these, thirty pounds is no uncommon weight for a good turbot, and some have been captured of double this weight. Moreover, allowing for the most enormous destruction of infant turbots, there must surely be a very large survival of a race so prolific that the late Frank Buckland counted no less than 14,311,200 eggs in the roe. Just imagine being the fond parent of fourteen million interesting children! I do not know how naturalists arrive at their conclusions, but some estimate that so multitudinous are the hungry foes ever seeking to devour them that perhaps not more than one of this large family attains maturity. Nevertheless they must be tolerably abundant where a single report of fisheries on the coast of Jutland tells of the capture of 240,000 turbot, weighing on an average upwards of one pound each. This certainly suggests a considerable item in the food-supply of the people.

I do not mean to suggest that size is always by any means an advantage in the selection of fish; on the contrary, it is always a red-letter day for us in our sea-side home when the fishers bring us tiny flounders for breakfast—the most delicate of all fishes (always excepting the flying-fish of warmer seas); but the fishing-ground where these are obtained is not much in favour.

Sometimes it happens that the lines have proved fatal to a multitude of the creatures which we (only seeing them high and dry on the sands) familiarly call jelly-fish, a mere bagful of sea-water, but which, in their native element, floating joyously in summer seas, are amongst the loveliest of graceful sea creatures, shaped like an inverted crystal goblet exquisitely marked with a brilliant pattern of rings or stars, and edged with a fringe of long sensitive feelers.

Strange as the stages of development from a caterpillar to a glad winged butterfly are the transformations through which some of these exquisite *medusæ* pass in the course of their short lives. When the autumn days approach, and the mother jelly-fish knows that she must soon melt away and lose herself in ocean foam, she lays thousands of tiny eggs, each covered with invisible hairs—hairs which move at will, like the spinner of the sea-urchin, by means of which the little living eggs paddle their way to safe hiding-places in the crannies of the rock, and there moor themselves. Thus anchored, and secure from winter storms, they patiently await whatever may be in store for them.

Presently from each egg there grows a tiny stem, whence spring delicate branches, and every branch is covered with minute cups edged with little dainty arms that float on every side. And when spring changes to summer, each graceful flower-like cup develops a new life, and becomes a tiny jelly-fish with thousands of fringe-like sensitive feelers, and the little creature frees itself from the stem and floats away in the bright waters to commence its own glad life of independence.

C. F. GORDON CUMMING.

## THE GREAT CENTRAL BAKERY IN PARIS.

AT a moment when our English bread and bakeries are receiving a good deal of attention it may not be uninteresting to hear of a visit recently made to the central *boulangerie* in Paris through the kind permission of the *Assistance Publique*.

The bread necessary for the consumption of all the hospitals and institutions of Paris which are under the control of the Assistance Publique has, since 1797, been made in a central establishment in the Place Scipion, and known by the name of the Boulangerie Scipion or Centrale.

This Boulangerie Centrale not only furnishes bread to the hospitals and hospices of Paris, but sells and delivers both bread and flour to most of the municipal and departmental services, as well as to several private charities.

This method of provisioning is according to the custom formerly adopted by the Hôtel Dieu and the general hospitals, both of which possessed their special *boulangeries* and particular mills. It was a method justified in the opinion of the administrators of that period by the consideration that when the point in question is the subsistence of the hospitals of a great city it is preferable to have an establishment of this kind, even though the bread should cost more, than to run the risks which might belong to provisioning from individual city bakeries.

The *boulangerie* consists of two distinct sections, as we shall see, a mill and a bakery.

The place itself has a history. It occupies the ground, and part even of the building which was constructed in 1540 by Bullioud, President of St. Marcel, and was bought in 1580 by a rich Italian, Scipion Sardini, who inhabited it until 1596. Acquired in 1639 by the governors and administrators "of the sick and infirm poor," it was by them appropriated to the use of this class of the community under the title of the Hospital of St. Martha.

Some years later, about 1675, the bakery, which had up to that time been established in the Salpêtrière, was removed to Place Scipion, and was henceforth to serve all the Hospitals-General.

In the same way as the Hôtel Dieu and the Incurables, the Hospitals-General obtained a great part of their flour from grain grown on their farms. This grain was prepared in three mills, one near the mouth of the Seine and the others at Corbeille, and known even to this day as the Mills of Corbeille, although they were sold long ago.

After the Revolution the reorganisation of the hospitals took place, and the first care of the General Council was to unite all the *boulangeries* with that in the Place Scipion; and this was completed, when at length, in 1797, the *boulangerie* of the Hôtel Dieu was annexed. Such is the origin of the establishment known now as the Boulangerie Centrale of Paris. Its present condition has been arrived at by degrees, and by resolutely wiping off abuses as they became known.

After a radical change in 1821 no important alteration took place in its organisation for thirty years, though one or two improvements were made; but at length, in 1856, the *boulangerie* underwent an important transformation both as regarded the provisioning and the processes of fabrication.

Experiments were made under the direction of a committee, which showed the possibility of obtaining a dough, with flour sifted to 75 per cent. —that is, with 25 per cent. only of bran—of sufficient whiteness, and presenting, as regards taste and hygienic properties, the same conditions as the bread of the bakers prepared generally with flour sifted to 66 or even 63 per cent.

These considerations decided the administration to construct a mill in the central *boulangerie*, to be worked by steam, at an expense of 300,000 francs, or £12,000, of which a large part was taken up by the city.

As a result, the *boulangerie* works with twelve pairs of mill or grindstones, of which six are ordinary and six are oscillating, moved by a special machine of 40 horse-power.

Since that time numberless improvements have been made in the plant as well as many additions to it; for example, a smoke-consuming apparatus for economising the fuel, and extra ovens at the time of the war for the supplying of bread to the troops, and special ventilation. In 1861 a huge bread-pantry was built, and adjoining the *boulangerie* in the Rue du Fer à Moulin store-houses were added for corn and flour.

The administration has always welcomed experiments which might conduce to improvement. Some of those made in the Boulangerie Scipion have been very interesting—one especially, by M. Mège-Mouriès, who, in studying a grain of corn through his microscope, recognised under the

cortical envelope, or outside covering, a hard part which contained more "azote" than the other portion. This he proved to be the most nutritious of the whole grain, but it was rejected in the manufacture of white bread because of its colouring matter, and because of its adhering to the pellicles of bran after grinding. His idea was to separate these brown groats from the other matter and use it for the best white bread; but his process, which was by washings, was defective and costly. Good came of it, however, for M. Salone, the director of this *boulangerie*, succeeded in rendering it practical by substituting a dry for the wet method of separation, and so manipulating it that it could be employed in the best white bread without in any way injuring the colour.

Other experiments have resulted in what at the present time is considered a perfect system of cleansing, kneading, ventilating, grinding, and sifting.

The grindstones, both those for the corn and those for the groats, grind from 130 to 140 kilos in an hour, and they work from six o'clock in the morning to six in the evening.

As one approaches the *boulangerie* it shows but few outward signs of the life and activity within. It is built round a court-yard, one side of which is given up to the offices, a second to the dwellings of five of the workpeople—of whom there are altogether seventy—and the other two sides are devoted to the actual bakery. The bread is made both by night and day, which is not surprising when one learns that 25,000 kilos[1] of bread are required each day—10,000 for the hospitals, hospices, and charitable institutions, and 15,000 for the depôts of sale established by the city for the benefit of workpeople and the poor.

The flour is sifted to about 74 per cent., in which are comprised the flour of the first shoot, the groats, and the second and third flour—these two last in a proportion of from 4 to 5 per cent. As to the fourth flour, which is too brown to be comprised in the mixture, it is, as well as the foreign matter and other products (23 to 24 per cent.), sold for general use in the course of the day. It is the same with the oats or barley siftings. Every loaf is the same weight—viz., two kilos.

The ovens, ten in number, lighted by gas and heated to a tremendous heat, were each served by two men, one of whom took the bread out or pushed it in with a long iron pole, while the other arranged it for him. The dough was carried from the kneading-trough to the ovens in long and shallow baskets, the shape and size of the bread. The men were scantily dressed, on account of the heat, and looked weird and uncanny, but they were scrupulously clean.

In this same room were huge machines mixing the dough with rapidity; they were worked by steam, and fascinated us by their steady regularity.

To the left is the pantry, a vast room full of shelves, where the bread is placed when baked, and where the name of the hospital for which it is intended is attached; for it is here that the bread is distributed at five o'clock every morning, when all the hospital carts arrive. A paper of delivery, indicating the number of loaves and their weight, is given to each conductor of every carriage. We tasted the bread, which was excellent.

To the right of this pantry rises a vast building, of which the ground-floor and first-floor serve as a store-house for grain, and the second and third floors as store-rooms for flour. These magazines are all very large and well ventilated.

The grain comes from all parts of the world, and the varieties were put into our hands that we might detect, if possible, the differences existing both in the grain and in the flour produced.

In the middle of the granary there are a series of traps or shafts running from the grinding-room above. The quantities are told off by the mealman and distributed into these shafts, which correspond to the mill-hoppers, placed on the first-floor. From these mill-hoppers the flour passes by little sifters to the ground-floor, and ends its career in the various kneading-troughs, which extend from one end to the other of the great baking hall.

The bakers are divided into two brigades—the first work from seven in the morning to five or six in the evening, according to the season of the year, and the second from six in the evening to five or six in the morning. The ten ovens are almost continually in use.

We were quite bewildered by the power and velocity of the machinery. Huge wheels of glittering steel and brass, whirling round and round, filled the air with clamour and noise, while they worked with untiring patience for their master—man. It was interesting to watch the various degrees of fineness to which the flour was reduced by these huge grinders, and to see how carefully the cylinders were guarded by silk canvas. We asked our guide if many accidents occurred, and he said he had been director of the machinery for twenty years, and in all that time had seen but one.

We watched the processes by which the flour was brought to a state of perfection. It was then weighed, regulated, and put in sacks by order of merit and fineness; after which it was mixed in a large room, where it was heaped up to the ceiling, for all the world like an edible and gigantic snowdrift.

As our journey through these regions of bread came to an end we were dazed by all we had seen; but one fact stood out clear and distinct—namely, that from beginning to end nothing soiled touched the material of which the bread was made—and such bread one does not often taste.

We went in habited in black—we came out white as snow.

E. BREWER.

# A CRUISE AMONG THE SOUTH SEA ISLANDS.

## IV.—TAHITI.

So much has been written about Tahiti by various visitors to that island—chief among the South Seas—that a long description of it would be as unnecessary as out of place in this paper, which is designed to treat rather of the less known and less visited parts of the Pacific.

We sighted the mountains of Tahiti, 8,000 feet high, when about seventy miles distant, and consequently some time elapsed before we reached our anchorage in Papeete harbour. On approaching the latter these mountains, and those of the neighbouring island of Murea, are strikingly grand in appearance, exhibiting abrupt peaks and mighty ravines with precipitous sides. They are somewhat bare, clothed with little else but grass, except in the valleys, which, like the plains by the sea-shore, are well wooded. A barrier reef surrounds the island at a distance of from a quarter to half a mile from the beach, and this reef is broken by numerous gaps, admitting vessels to anchorage in the smooth water inside. Through one of these gaps we passed into the harbour of Papeete, on the north-west side of the island, and anchored off the thoroughly French-looking little town stretching along the sheltered shore.

Papeete is a town lying in a garden. The neat red roofs of its white houses are half concealed by splendid trees. Each street is an avenue, and the smooth roadway is cool and dim beneath the arch-forming branches of the trees which line its sides. The enclosures surrounding the houses are rich with flowers. Outside the town the whole country lying at the foot of the mountains is one vast garden of fruit and flower, wood and stream. Calm bays reach in from the sea here and there, and through their crystal waters the beauties of the coral forests and caverns below can be seen.

Tahiti is a beautiful island, in which Nature is so generous that the natives have little need to work for their living. But they appeared to us less happy-looking than those of Atiu and Rarotonga. This no doubt is the result of their feeling themselves a conquered people, their independence lost. And the French, who cannot colonise like the Anglo-Saxon race, have apparently done very little to improve their fair possession. Jealous of foreigners, they have to a great extent stifled trade by their treatment of foreign vessels, which now often prefer to visit islands where more tolerance is encountered, and by the want of encouragement to Tahitian industries, which are, or were, chiefly in English hands. The natives are demoralised by the influx of French soldiers and sailors; and the island is treated by the French squadron and garrison as a pleasure garden rather than as a centre of civilisation, and licentiousness and insobriety prevail unchecked. Laws, indeed, there are, but they are laxly carried out. It is impossible to avoid comparison with the neighbouring island of Rarotonga, where, under a simple-minded native queen, a higher standard of morality and order is maintained, without the cumbrous and elaborate farce of government kept up in Tahiti, with its Palais de Justice, gendarmerie, *prison coloniale*, various and many departmental *bureaux*, betitled officials, bombastic public placards.

This rich island, with all its possible resources, is wasted by the French, under whose rule, devoid of beneficence and merely burdensome, the natives secretly chafe. In spite of these reflections, and to return from generalities to our own particular visit, we spent a very pleasant week there, thanks to the hospitality of several friends English and French. And indeed, in such a glorious climate, and amidst such scenery, it would be hard not to enjoy oneself, especially after a long cruise at sea.

## V.—PITCAIRN ISLAND.

In making the subsequent passage to South America we had occasion to call at Pitcairn Island, and were consequently able to become acquainted with its little community, which will always possess a peculiar interest to the English, as consisting of the descendants of the Bounty mutineers.

The history of those mutineers is pretty generally known, but may here be briefly repeated. The Bounty, an English sloop-of-war, commanded by Lieutenant Robert Bligh, was sent out to Tahiti in December, 1787, for the purpose of obtaining bread-fruit trees, to be introduced into certain of the West Indian islands. She arrived at Tahiti in October, 1788, and lay there some months. The fascinations of the beautiful island, and perhaps especially of its graceful women, proved strong to the man-of-war's men, so strong, indeed, that a few days after leaving Tahiti on the return voyage a number of the men, headed by a few officers, set the captain, with nineteen others who remained loyal to him, adrift in an open boat, with a few necessaries, and then took the ship back to Tahiti. Bligh, after great hardships and sufferings, reached the island of Timor, to the southward of Java, in his open boat, a distance of nearly four thousand miles, with the loss of only one life.

Of the mutineers, some who remained in Tahiti were afterwards captured and hung. Nine others took the Bounty, accompanied by their Tahitian wives and a few natives, to Pitcairn Island, where they burnt her and established a settlement. At first their existence there was a stormy one; quarrels with the natives they had brought with them led to bloodshed, and in a few

years all the mutineers had met with violent deaths except two—Young and Adams. These two lived to a ripe old age; in their latter years repentant and pious, bringing up the young people of the colony in the way of religion and quietness. After Young's death old Adams continued alone as the teacher and head of the community. They increased in numbers to the third generation, and still revered and obeyed this patriarch, living in accordance with his simple and pious precepts. When he died, in 1829, the elder ones remaining carried out the same principles, and to this day the Pitcairn Islanders remain a model moral community.

In 1856 their numbers had increased beyond the supporting powers of the little island, and the whole body emigrated to Norfolk Island, some distance to the westward. But in two or three years a longing for their old home led a number of them back to Pitcairn, where they still remain. The Queen has always taken an interest in their welfare, and some years ago sent them a fine harmonium for their miniature church. The island is also visited at intervals by English men-of-war, who report the progress and the wants of the islanders. Merchant ships in passing also frequently call.

We anchored off the only available landing place, on the north side of the island. Looking ashore, the appearance of the place is striking. The island is barely three miles long by one broad, yet it is over a thousand feet high, suggestive of some huge submarine mountain protruding its highest peak in mid-ocean. Its steep sides are wooded and green, and descend, broken by an occasional plateau assiduously cultivated, precipitously to the water's edge. The village lies on a slope less steep than the average, and is so hidden among trees that only a few thatched roofs here and there are visible from the sea. Below the village the slope ends in a red perpendicular cliff two hundred feet or so high, at the base of which the surf of the sea beats upon large black detached rocks. On each side of the village stands a tremendous precipice facing the sea, the two about a mile and a half apart, rising sheer and naked almost the whole height of the island. They look like two stern and mighty giants uprearing boldly to protect the village nestling in pastoral peace on the green slope between them. This fancy is strengthened in the case of the greater of the two precipices by a curious resemblance in its upper part to the profile of a man's head, even the eye and mouth being represented by marked indentations. Near the base of this one, the easternmost of the two, is the landing-place, a small sandy cove partly protected by outlying rocks from the swell setting in on the coast.

From this cove a boat put out as we anchored, and as she came alongside and her occupants came over our gangway we scanned them with no little interest. They were, on the whole, an English-looking set of men, dark in complexion in some cases, but in others as fair as though there had been no admixture of Tahitian blood. They were dressed in European style, and had a seafaring appearance, due to their semi-nautical attire, the result of contact with ships and sailors, and to their occupation of fishing, which forms a part of their daily work. They were headed by Mr. Robert McCoy, a name familiar to those acquainted with the history of the Bounty mutiny, like the names of Christian and Young, which were largely represented among our visitors. Mr. McCoy was the "magistrate" for the time being, an office filled annually by election among the islanders. Owing to the intermarriage of so few in the first place there were a great many of the same name—cousins, uncles, and nephews. The oldest of the men, Thursday October Christian and Moses Young, were grandsons of the original Bounty mutineers so named.

As we were to remain at the island until the next day I accepted the hospitable offer of Moses Young to spend the night ashore, and shortly afterwards landed under his guidance to view the colony. Disembarking on the little beach, near which was a boat-house and a number of island-built canoes used for fishing purposes, we ascended a steep path of red clay rising sidewise up the face of the bush-grown cliffs, above which it became level, and led us towards the village. It was an exceedingly pretty walk, the path first passing through a wood of tropical beauty, the banks on either side rich with ferns, and then, as the settlement was approached, through patches cultivated with sweet potatoes, yams, arrowroot, pineapples, and bananas.

We found the village to be a collection of well-built wooden huts, roofed with pandanus-leaf, and scattered on the hillside in no sort of order, but connected by neat paths, winding through the groves of orange, lime, hybiscus, and cocoanut trees that sheltered and shaded the settlement. The aspect of the village, thus lying among the trees, as in a wooded garden, was peaceful and pretty. Roses, lilies, and geraniums grew untended near some of the houses, and a few wild flowers added their beauties to the slopes beneath the trees.

In the village we met a number of the gentler sex, who form a considerable majority of the population. These were for the most part quite fair in complexion, resembling English rustic women, but without the ruddiness of the latter. A few, however, were of the "nut-brown" type, betraying their semi-Tahitian descent. They were all dressed with extreme simplicity, in plain cotton print dresses, generally with a loose bodice or jacket, showing an absence of the confining corset of civilisation. With them was the venerable Mr. Young, a cousin of my host, who acts as pastor to the community. In his company, and that of his wife, kind-hearted and active Mrs. Young, I visited the little church, a long low white-washed building, not unlike an English cottage. Its interior was neatly furnished with rows of polished benches, and at the east end a little sanctuary was railed off, in which stood a communion table and the handsome American organ presented by Queen Victoria, which was in sad need of repair.

The Pitcairn islanders have hitherto steadily maintained in its simplest form the worship of

the Church of England, and the earnest steadfastness of their religious belief has always been worthy of high admiration. It will be a matter of regret, therefore, to many who are interested in the little community to hear that within the last year or two their principles have undergone a revolution, and that they have enrolled themselves among the Seventh-day Adventists—a sect originating in the United States. It was with natural surprise that I heard of this change, and in the course of conversation found that its cause was the visit to the island of an Adventist missionary who remained some months inculcating the doctrines of his sect among the islanders. He could have found no better soil in which to sow his doubtful seed. Very earnest and anxious to learn, implicit believers and reverencers of the Bible, the simple islanders, ignorant of sophistry and the subtleties of Scriptural deductions, listened attentively to the arguments of their fanatical visitor, who, taking the Bible as his standpoint, soon convinced them of the soundness of his views. These views (by no means new, of course) are founded chiefly on passages in Daniel and the Revelations, and are sufficiently indicated in the title of the sect. The island was flooded with Seventh-day Adventist literature, emanating from the headquarters of the sect in Michigan, and the islanders were full of the enthusiasm of converts in the pursuit of their new creed. From the same source as that of their religious teachings the poor Pitcairnites have received pamphlets fulminating against the use of tea and coffee, and urging entire abstinence therefrom. These have had their desired effect already on some of the Pitcairn enthusiasts, who, already teetotallers, are denying themselves those domestic comforts. The use of tobacco has also, with perhaps more reason, been given up altogether.

After seeing the church, we visited the large schoolroom adjoining it, where all the children and young women attend daily for instruction. Miss Rosalind Young, the pastor's daughter—a young lady who has made her appearance as an author in an American magazine—is the teacher, her father undertaking the musical department, which is a special feature in the education of the islanders. We then walked through the village, or rather from house to house, by the paths winding through the wood which shelters the settlement. Orange-trees, loaded with green but ripe fruit, abounded by the path-sides, and pineapples, over-ripe from want of plucking, formed boundaries in places. Bananas, limes, papaw, and cocoanuts were plentiful all around. We entered several of the houses, which are all more or less on the same plan, simply but strongly built of wood, and thatched admirably with pandanus leaves. Generally each house consisted of one large central room, into which one stepped on entering, and of a number of small cabin-like sleeping rooms leading from it, divided by partitions not reaching to the lofty thatched roof. The furniture was simple and well-made, in style much like that of many an English cottage. The domestic life of the Pitcairn islanders, in fact, resembles more that of the English rustic than of the Tahitian native, although characteristics of both quaintly blend in some matters. For instance, the Pitcairn women industriously make pretty little baskets woven of leaves by Tahitian art, but adorned with designs of flowers and figures in coloured worsted, with simple English mottoes, much like the ornamental handiwork of some of our rustic maidens. The houses themselves, too, are constructed on Tahitian lines, but English domesticity reigns within.

After seeing the village, Mrs. Young took me up the hill to see the various plantations. The walk was of great beauty, for Nature is lavish of her gifts to the small island, and its inhabitants have turned them to good account, each family cultivating patches of vegetable, grain, and fruit in all available places. The path was steep, but my kind guide, although the oldest woman in the island, displayed an activity that spoke well for the healthiness of the climate. From the summit of the island, swept by the fresh sea-breeze, we enjoyed beautiful views of the bold steeps and green ledges below us.

Returning to the village at dusk, my host met us, and led me to his house, where a substantial supper awaited us. This disposed of, we adjourned to another house in which a number of the islanders, chiefly women and girls, had assembled for music. This consisted chiefly of part-songs and hymns, sung very creditably, showing the good training all had undergone at the hands of Mr. Young. The quality of voice in the women possessed something of the peculiarities noticeable in the native singing we had already heard in other islands, and the same tendency to long-drawn pauses was sometimes displayed, but all the parts, strictly learnt from note, were true. At half-past ten (a late hour for the islanders) the party dispersed, and I returned with my host to his house, where he left me for the night in as comfortable a little room as one could desire, in which I passed my "night in Pitcairn Island"—a rather unusual experience.

I was awakened at about five in the morning by the sound of singing which proceeded from an adjacent house. Sung fully in parts to a beautiful tune, this morning hymn (for such it was) formed a curious and pleasing *reveillé*, and it was followed in a few minutes by another hymn, similarly sung by the inmates of the house in which I was lying. I could then hear the reading of a chapter of the Bible, each member taking a verse. I afterwards found that this formed the daily practice in every house in the island. When I made my appearance a little later all were astir and at their various domestic occupations indoors and out. Accompanied by some of the islanders, who were going on board the ship, I walked down to the landing-place in the fresh coolness of morning having said "good-bye" to my kind entertainers, who sent baskets of vegetables and fruits down with me as farewell gifts. In a few hours our sails were again spread to the south-east trade wind, and Pitcairn Island, with its curious little community, descended from our countrymen, was numbered among our many memories of the Pacific.

# NOTES ON CURRENT SCIENCE, INVENTION, AND DISCOVERY

## THE WEATHER-PLANT.

IN the autumn of last year some extraordinary paragraphs and letters appeared in London newspapers giving accounts from Vienna of a plant the movements of which, it was said, predict the changes of the weather. The more delicate leaves, it was alleged, foretell meteorological changes forty-eight hours in advance, whilst its hardier leaves indicate such phenomena as explosions in mines and earthquakes as much as three days beforehand. On November 5th, according to the Vienna correspondent of "The Times," Herr Nowack wished it to be known that at that date his plants were giving indications of shocks of earthquake, which might be expected to occur during the next week within one hundred German miles south of Vienna. Herr Nowack's claims for his plants were endorsed by the late Prince Rudolph—no inconsiderable naturalist—and by the Archduke Reiner. Several Austrian tourists' clubs had discarded both aneroid and ordinary barometer in favour of the prophetic plant in question, and it seemed as if the days of weather-charts and storm-warnings of the orthodox kind were numbered, and were about to be superseded. In July steps were taken at Kew Gardens to test the merits of the plant, Herr Nowack obtaining an introduction there from his Royal Highness the Prince of Wales, who when in Austria had his attention called to the subject by the late Crown Prince Rudolph.

The "Kew Bulletin of Miscellaneous Information" for January contains a report made by Dr. Oliver, of University College, on a series of experiments carried out in the Jodrell Laboratory of the Royal Gardens last autumn. Herr Nowack attended at Kew Gardens in person and superintended the experiments, he himself preparing the forecasts, and Dr. Oliver and Mr. Weiss making a close inspection of the movements of the plants, and noting the actual weather experienced from day to day so as to check the correctness or otherwise of the predictions. The plant is the well-known tropical legume, *Abrus precatorius*, a shrubby climber, originally a native of the East Indies, but now scattered to the Mauritius, West Indies, and other tropical countries. The leaflets of this plant are not unlike those of the more familiar acacia, but it is better known in England by its scarlet bead-like seeds, which are largely used in some Roman Catholic countries for rosaries; hence its vernacular name, the "Paternoster pea."

Herr Nowack professed to be able to ascertain what would occur at some future date—the weather forty-eight hours hence, and earthquakes and fire-damp days or weeks hence, anywhere up to a distance of many hundred miles. But notwithstanding the unexampled facilities accorded to him, that gentleman made a very poor show of what it was possible to attain in the way of forecasting anything. There were numerous changes in the weather during October, but although there were over a hundred and forty predictions, Dr. Oliver states that only one change was anticipated by Herr Nowack. The predictions of earthquakes, *schlagwetter* (fire-damp in coal-mines), and the positions of areas of high and of low barometer within the limits of the Meteorological Office Daily Weather-charts were submitted to Mr. R. H. Scott, and were found to be as unsuccessful as the weather-forecasts. Of nine earthquake predictions, one was correct and eight failures; of nine *schlagwetter* two were correct, two nearly so, and five failures. Between fifty and sixty barometric charts were drawn up, and on placing them side by side with those prepared from the facts at the Meteorological Office "no accordance was found between the successive pairs of maps."

There can be no doubt that the claims so unwisely made for *Abrus precatorius* as a weather-plant have been badly discredited. A second and more unfortunate result would be the misappreciation and neglect of such merits of a meteorological character as the plant may yet possess, in spite of the exaggeration of which it has apparently been the victim. That it will well repay closer observation than it has so far received from English botanists seems clear from the candid and ably-written report of the experimenter at Kew, Dr. Oliver. "From the moment," writes Dr. Oliver, "I had these plants under observation I was much impressed with the extraordinary sensitiveness of their leaflets to alterations in the intensity of the light, and the view which I first formed as to the nature of their up-and-down movements was, in the main, that they were caused by these fluctuations." The action of light on many leguminous plants has long been a well known fact to vegetable physiologists, as may be found by reference to the works of Pfeffer and the Darwins; but it will hardly be denied that more recently our physicists have made claims for the action of electricity and magnetism upon plants which somewhat diminish the territory of the botanist. "Sensitive and other muscular plants are well known to set up electric currents," said Dr. Oliver Lodge in his address to the Liverpool Physical Society, "and about their electric phenomena there is much to work out." In fact, light means much more to the physicist than to the botanist in these days, when electric waves and light waves have just been proved to be identical.

Herr Nowack's claims for *Abrus precatorius* as a weather-forecast have doubtless defeated themselves by their own exorbitancy, but it is quite possible that a new era has began in the observations of a singularly interesting plant, and that from the physical side of the questions raised new and important data may accrue.

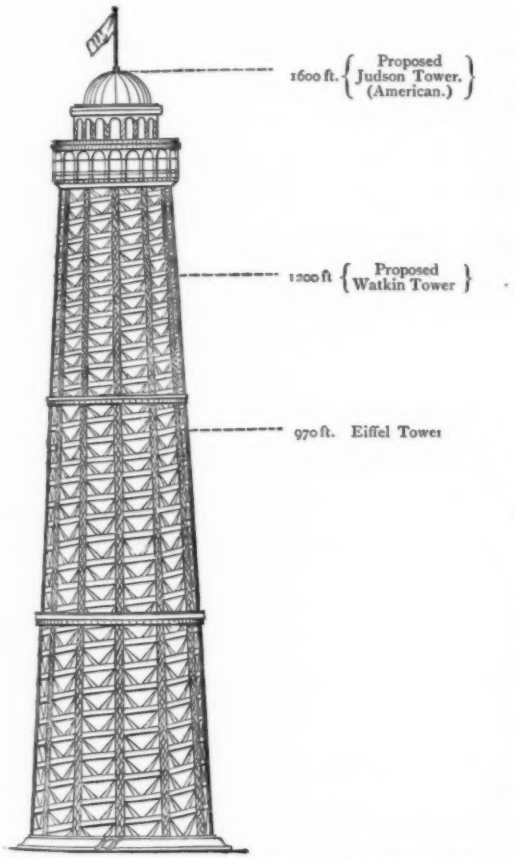
### THE INTENSE DARKNESS OF THUNDERCLOUDS AND LURID YELLOW LIGHT.

At a recent meeting of the Physical Society of London Mr. Shelford Bidwell, F.R.S., read an important paper on "The Electrification of the Steam-jet," with experiments showing the bearing of the subject upon meteorology. The author showed that the opacity of steam issuing from a nozzle is greatly increased by bringing electrified points near it, and that its colour is changed to orange-brown. Electrified balls and discs when placed in the steam produced similar effects. On examining the absorption spectrum of the unelectrified jet, little or no selective absorption was detected, but on electrification the violet disappeared, the blue and green were diminished, and the orange and red remained unchanged. From these results the author concludes that electrification causes an increase in the size of the water particles in the steam, from something small compared with the wave-length of light to about one-fifty-thousandth of an inch in diameter.

These observations are of considerable meteorological interest, for the steam-jet phenomena go far towards explaining the cause of the intense darkness of thunderclouds, and of the lurid yellow light with which that darkness is frequently tempered. Helmholtz conjectures that the sudden condensation and increase in the size of the water particles may be due to molecular tremors or shock imparted by the electrification, upsetting the unstable equilibrium of the supersaturated vapour, just as a supersaturated saline solution is suddenly crystallised when disturbed. On reading Helmholtz's paper, the author tried the effect of gas-flames on water-jets, and found that when luminous they influenced the jet considerably, whereas non-luminous flames had no appreciable effect. He also found that luminous flames are positively electrified, and demonstrated this before the audience. The new and important observation that gas-flames are electrified was confirmed at the meeting by the president, Professor Reinold.

### VARIABLE STARS: ALGOL AND ITS SATELLITE.

The phenomena of variable stars—stars which periodically die down into greatly reduced light or complete invisibility, and then resume their full-orbed brilliancy—would be vividly brought home to us if our own sun were one of the number. Did the sun become eclipsed to us every three days, as is the case with some other stars, the climate of the earth would seriously suffer. In well-known cases, where the eclipse lasts for three or four hundred days, it is easy to understand how a "glacial period" may occur on the satellites thus deprived of light and heat. Among the short-period "variables" which are visible in our northern latitudes is the star Algol, which, fortunately for amateur observers devoid of powerful telescopes, is visible with the naked eye. Algol is usually a little fainter than a star of the second magnitude, but if watched it will be found that it remains at this degree of brightness only for two days and thirteen and a half hours, and that it then rapidly declines in lustre, and within some three and a half hours becomes nearly fourth magnitude. It continues at this minimum about fifteen minutes; then it suddenly acquires greater brilliancy, and in three and a half hours assumes its ordinary magnitude. This periodical fluctuation of light is so regular in its occurrence, and the star dies down so punctually to its degree of least brightness, that the minima can be predicted within a few seconds; so that tables recording their exact times are drawn up in our astronomical almanacks for a year in advance. There have been various theories proposed to account for the phenomena. There are short-period variables like Algol, whose period, as we have seen, is less than three days, and long-period variables like Mira, whose period is over 330 days. With stars of the long-period type and the peculiar causes of their fluctuations we are not now concerned, but with short-period variables like Algol all the facts seem explicable by supposing that a large dark satellite makes periodical transits across the face of the principal star. With regard to the theory which would suppose that the primary has different intensities of illumination on opposite sides, Mr. W. H. S. Monck, a well-known Dublin observer, has remarked that this will hardly account for the light remaining constant for sixty hours and then falling in four or five hours to two-fifths its former value. So far the observations at Greenwich are in favour of the satellite theory. It is manifest that a satellite which can revolve around so large a star as Algol undoubtedly is in less than three days, and produce a reduction of light in the proportion of five to two, must be in close proximity to its primary.



Some remarkable deductions with regard both to Algol and its satellite are just reported from Berlin. At the meeting of the Royal Prussian Academy of Sciences, held on November 28th, Professor Vogel gave the results he had obtained from photographs of the spectrum of this variable. Professor Pickering had pointed out some years ago that if the variation in stars of the Algol class were due to the transit of a dark satellite across the disc of its primary, producing a partial eclipse, then since in every case yet known the two bodies must be close to each other, and of not very disproportionate size, the primary must revolve with very considerable rapidity in an orbit round the common centre of gravity of the two, and therefore be sometimes approaching the earth with great rapidity, and sometimes receding from it. Six photographs of the spectrum of Algol—obtained, three during last winter and three during the past November—have shown that before the minimum the lines of the spectrum of Algol are markedly displaced towards the red, showing a motion of recession, but that after the minimum the displacement is towards the blue, showing a motion of approach. Assuming a circular orbit for the star, and combining the details given by the spectroscope with the accompanying variation of the star's light, Professor Vogel derives the following elements for the system of Algol:

| | | |
|---|---|---|
| Diameter of Algol ..... | 1,074,100 | English miles. |
| Diameter of the dark companion ..... ..... | 840,600 | ,, ,, |
| Distance of the centre ..... ... | 3,269,000 | ,, ,, |
| Speed of Algol in its orbit..... | 27 | miles per second. |
| Speed of the companion in its orbit ..... ..... | 56 | ,, ,, |
| Mass of Algol.. ..... ..... | ⅓ | of the Sun. |
| Mass of the companion..... | ⅔ | ,, ,, |
| Speed of translation of the entire system towards the earth | 2 | miles per second. |

Mr. W. H. Monck announces that the observations made at Greenwich tend to the same results as those arrived at by Professor Vogel.

### A 1600-FEET TOWER.

As the Eiffel Tower of the Paris Exhibition, some 970 feet in height, is to be succeeded by

PROPOSED 1600-FT. TOWER. AMERICAN EXHIBITION, 1892.

the Watkin Tower in London, rising to 1200 feet, so it would appear there is to be a Judson Tower at the American Exhibition of 1892, excelling its two predecessors, and aspiring to a height of 1600 feet. The design of the Judson Tower, as will be seen from the engraving, makes no pretension to the graceful outlines of the structure in the Champ de Mars. What the author aims at is a tower some 630 feet higher, and provided with almost unlimited accommodation for visitors. Its capacity for sightseers would seem to be almost boundless. Two separate and independent roads run from base to summit, with a width varying from 75 ft. at the bottom to 50 ft. at the top. Each road makes seventeen complete circuits of the tower, and is 3¾ miles in length, with a gradient of 8 in 100. One path is to be reserved for ordinary street vehicles, while the other is to be traversed at half-minute intervals by tramcars, propelled by Judson's pneumatic system, and capable of carrying sixty passengers each. Inside the spiral inclines are to be ten circular floors 275 ft. in diameter, or 125 ft. less than the base of the tower. The exact purpose of these does not seem to be yet determined, but one American paper drops a hint that they would furnish sites for a number of popular hotels.

As to the plan of the tower, especially with regard to the roads from base to summit, the designer can hardly be held to have plagiarised from M. Eiffel. Though far less picturesque than the well-known Chaldean "ziggurats" (familiarly known to the present generation by the slabs from Koyunjik, and in the pages of Canon Rawlinson's "Five Great Monarchies," and by the "restorations" of MM. Perrot and Chipiez), the roads leading up to the summit of the Judson Tower inevitably remind the reader of those wonderful structures of the Mesopotamian plains, which were temple and observatory in one. It is estimated that as many as 94,000 persons will be able to ascend the Judson Tower daily.

### ADVANCES IN HIGH-POWER MICROSCOPY.

The annual winter conversazione of the chief microscopical societies in London and the large towns have again afforded opportunities for utilising the summer Saturday afternoon excursions to the pond-side, the woodland, and the sea-shore; and the papers which have been read and the objects exhibited have helped to kindle afresh the torch of science at these useful and pleasant social gatherings. It is here that the new recruits of microscopy, the amateurs full of enthusiasm for their newly-discovered science, receive practical guidance which saves them from mistakes but too commonly made. Here the novice is restrained from the danger of rushing prematurely into high-power microscopy, with its one-tenth object-glasses and its immersion-lenses, and is taught to enjoy to the full the almost boundless world which is opened to him by the lenses of lower powers, the half-inch and even the one-inch glasses. The initiation which may thus be gained into the fascinating life-lore of the minute aquatic world, the structure and tissues of organic and inorganic nature, and indeed the whole of the microcosmos around us, is an end and a reward in itself, even though the microscopists never venture into the complex questions of optics which beset the use of the higher powers.

Naturally enough, however, it is in the region

of high-power microscopy that the annals of the season have been most fruitful. During the winter of 1889-90 Dr. Zeiss's "apochromatic" lenses have come still further under notice, with the result of confirming the impression that the high-power work of the future will almost necessarily be done with these glasses. As the first important era in the history of the microscope set in when the lenses were achromatised, a fairly large aperture being secured with an accompanying reduction instead of an increase in the marginal false colours, so a second era, with the promise of conquests hitherto undreamt of, seem to have set in now that the lenses are "apochromatised"[1] and the intrusive colours still further cut off. It would take us too deeply into the complex and highly-refined questions of optics were we to follow the "higher microscopy" into the fascinating and fruitful regions which have lately been opened up by Professor Abbé and his able English disciples. (*Inter alia* it may be mentioned as a sign of the times that it is no uncommon sight now to see a microscope in which as many as twenty lenses—a veritable optical battery—are employed in the common task of exhibiting and resolving the object!) Suffice it to say that between the immediate past and the present there is an ever-widening gap. In the old days of achromatism and its imperfect correction of coloured rays and spherical aberration, only the extreme rays—the violet and the red—could be collected to one focus, the consequence being that the images of objects seen through such a lens were bordered on one side with a purple fringe and on the other with a green fringe. In fact, the "secondary spectrum" remained uncorrected. The feature of the new "apochromatic" glasses is that the secondary chromatic aberration is now eliminated; the lenses collect three different rays to one focus, and only leave uncorrected a small tertiary spectrum. By these means a more perfect concentration of all the rays proceeding from the object is obtained. Lastly, not only the secondary chromatic aberration, but the chromatic difference of spherical aberration, has been done away with. The use of compensating eye-pieces in connection with the apochromatic glasses has already been mentioned in a former paper.

Unquestionably the event of the winter conversazione was the announcement at the Royal Microscopical Society in December of the production of a new object-glass, which was said to have cost the enormous sum of £400. It was of course an apochromatic, with the largest aperture yet known. It is reassuring to learn that the cost of this new glass has been somewhat overrated. The design was started by Professor Abbé, of Jena, four years ago, but it was only in August last that the Professor was able to complete the preliminary calculations, and to commence the actual execution of the objective, which was finished on the 17th September. It is of one-tenth of an inch focus, and with an aperture of 1·63 (the highest aperture previously known was 1·52). It has a special compensating eye-piece, which removes the last traces of colour. It is of course an "immersion" objective; immersion in microscopy consisting of the interposition of a fluid between the front lens of the objective and the object itself, and even between the condenser and the object; the aim being of course to compel the rays of light to pass direct from the condenser into the objective instead of escaping into the air by the numerous outlets otherwise on hand *en route*. (All microscopists are aware that, as regards minute structure more especially, collection of the widest possible angular field of rays from the object is a point of the utmost importance for correct *delineation*, quite irrespective of greater illumination; and it is in this respect that immersion objectives have such an enormous advantage.) The immersion fluid used is mono bromide of naphthaline. Other refinements of the astutest kind for further economising the light, and using to the utmost the extraordinary angle of aperture, might be mentioned; but we must content ourselves with a brief description of the lenses of the objective itself. These consist of the following battery:—(1) Front lens (more than a hemisphere) of flint-index 1·72; (2) achromatic lens; (3) crown glass len; (4) achromatic lens; (5) correcting lens, three glasses. It should be said that three of the lenses are in fluorite. The new objective has been tried upon the time-honoured test-objects—the minute plantlets Amphipleura and Pleurosigma, with the result of showing how imperfect the previous resolutions of these diatoms had been with the best objectives. Many other objects which have hitherto required oblique light for their resolution have now been resolved with axial light. A series of micro-photographs had been taken with magnifying powers up to 15,000 diameters.

Lest, however, it should be thought that the higher microscopy leads up to prohibitory prices as regards the necessary lenses, it may be added that a very satisfactory movement is taking place with regard to low powers, even with the unique apochromatics. Professor Abbé and Dr. Zeiss have just produced a new half-inch object glass at a cheap rate, which is considered by experts to be the highest achievement of optical science. Mr. E. M. Nelson, one of the foremost of London microscopists, both in theory and practice, recently produced at the Quekett Microscopical Club a one-inch and a two-third object glass (semi-apochromatic), each of which may be had for a few shillings, or at least at about half the price of English objectives. In high-power work Reichart's one-twelfth oil immersion (apochromatic) can be had for £5.

Microscopists of all ranks—low-power amateurs and high-power experts alike—will be glad to learn that the new edition of that some-time classic "Carpenter on the Microscope" has been charmingly re-written, much enlarged, and brought down to date by Dr. Dallinger, F.R.S., assisted in the "brass and glass" department by Mr. E. M. Nelson. This comprehensive work will give for the first time in English a concise and intelligible account of the more modern views of the nature

[1] See "Leisure Hour" for 1889, page 208.

of microscopic vision (including the now generally accepted "diffraction theory" of the formation of images, which is so familiarly associated with the name of Professor Abbé), as well as treating fully of the latest instruments, lenses, and combinations, the modes of preparing objects for microscopical examination, and an enlarged and modernised account of the microscopical objects and structures which were so good a feature in Dr. Carpenter's manual. For beginners and advanced students alike the work promises to be invaluable. It will probably be issued before the autumn.

### REMARKABLE HAILSTONES.

The hailstones here pictured are reproduced from the lithographs of this form of hail which are given in Professor Abisch's paper "Ueber

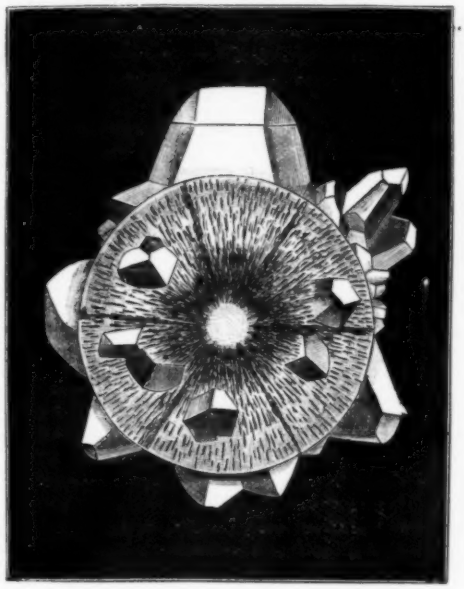


FIG. 1.

Kristallinischen Hagel im Thrialethischen Gebirge," published at Tiflis. They fell on June 21st at Bjelor Klintsch, a village about twenty miles south-west of Tiflis, in the Russian Caucassus. It will be seen that, like two others of a similar character already pictured in our pages,[1] they are spheroidal bodies of definite crystallised structure overgrown by a series of clear crystals exhibiting various combinations of the hexagonal system. It will naturally be asked how can masses of ice of such size be formed in the air, allowing both

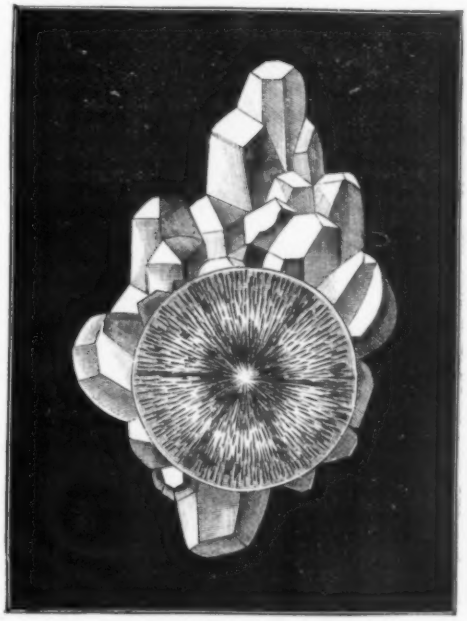

FIG. 2.

for a certain statical period of their existence in a more rudimentary form, and for the time occupied in their descent, inasmuch as when either drops of water or ice crystals get beyond a certain size they can be no longer buoyed up in the air. It should, however, be remembered that this certain size is by no means always the same size. Moving air can support a heavier weight than still air, and there are often strong winds blowing in hailstorms either within or above our own range of vision. Whirlwinds and ascending currents often not only arrest the falling hailstones, but carry them up again to a very considerable height. The circumstances generally attendant upon hailstorms—the sultry close weather which precedes them, the sudden barometric depression, and the rapid ascent of moist warm air into the upper regions of the atmosphere—help to explain the interesting phenomena.

## A Dream of Spinning and Weaving.

A BEAUTIFUL dream came once to me;
I set it down for thee and thee.

I wandered away from mist which spoke
Of a distant city's murk and smoke;

To seek for linen clean and fair
(Such the king's daughter of old did wear),

So fair that my soul the search refused
Where the workers' hearts were broken and bruised,

Or shut away from the light of home
In the factory's noise and dust and gloom.

"Is there never a place," said my heart to my heart,
"Where labour and joy are not apart?

"Where hand and brain delight can take
In true work done for true work's sake?"

And I dreamt the good north countrymen
Said, "Here will ye find the white linen,

"Made from the blue-flowered plant which grew
Fed by our English sun and dew."

I would have my thread, I told them, spun
Where the light of the happy English sun

Through window or open door shines clear
On grandam, mother, or maiden dear.

I would have the thread spun strong and smooth
By the hands of age or the hands of youth;

Which, it would matter not a whit,
So the women were glad a-spinning it;

So hand and foot the pleasure knew
Of work that is happiness to do;

That shuts not away from home and hearth,
And the sweetest joys of all the earth.

The girls should sing and the grandams croon
Dear words which go to familiar tune.

And the web should be woven by hands that know
To fling the shuttle to and fro,

Nor fear to pause with a smile, and say,
"God give ye, neighbour of mine, good-day;"

Nor fear to leave the loom alone
Before the golden day had gone.

I would have the linen laid a-bleach,
In sound of children's laugh and speech,

In the dear green fields a-near the home,
Where crisp breath of the wind should come;

And the dew should fall a-morn, a-night,
And the sun shine down in his lovely might,

Till white it grew and whiter still
As wind, dew, sun, should work their will.

The good linen should wear and last
When my time on earth were over and past;

And win fair praises verily
In the days a-coming by-and-by.

And where should the spinning and weaving be?
Oh, where but in the north country,

Where Ruskin's feet tread wood and hill,
And Wordsworth's spirit broodeth still?

And, because in my dream it seemed I knew
That one was a-work to make it true,

Asleep or awake, my heart did say,
"*God bless you, Master Fleming, to-day!*"

EMILY H. HICKEY.

## Varieties.

**The Chinese Poet Li-tai-po.**—This poet wrote verses on the spur of the moment, and the power to do this distinguished him from other writers. However short a time he spent on his impromptu efforts, they seemed to be excellent, and to need no correction. The following story, with the accompanying piece, will help to illustrate the reputation of this author for impromptu poems. The poet himself speaks.

"A friend named Hoo, of the city of Hwang Shan, had some silver pheasants which had been hatched by a domestic hen belonging to the house. They were very tame and knew their names, coming when called, and taking food from the hands of those persons with whom they were familiar. But these birds were choice and peculiar in their habits, and not easy to rear. I was very anxious to have such birds, and had failed to find any, but my friend Hoo parted with his and made me a present of a pair, only asking a poem in return. Hearing this, I was very pleased, because it was just what I had long wanted. I took my pencil in hand, called out three times, and the poem was finished. Without adding stroke or point I gave it him."

A PAIR OF SILVER PHEASANTS.

Permit me with fine pieces of my clear cut jade to buy
A pair of your white pheasants which much delight my eye,
They shine like silver brocade woven with art and care,
The snow just newly fallen may not with them compare.

Their shadows in the fishpond reflected you may see,
As they brush their stately feathers under the old elm tree.
They roost in quiet places beneath the moon by night,
And leisurely 'mid falling flowers walk in the broad daylight.
To amuse myself when lonely, I wished such birds to own,
While wandering on the mountains, I sit on some grey stone.
These birds my friend most kindly has given to me to-day,
I will send them in their cages at my country home to stay.

Another poem by the same author is called "Washing my Tassel." The dust storms of China render much cleaning very necessary to the traveller—

Quiet I watch the fish as they swim in this green pool,
Where autumn leaves are falling on the waters clear and cool,
And purple fins are leaping as the sun begins to sink,
And each one where it touches sends a circle to the brink.
See, too, the white mist floating where the bamboos close their rank,
And the Autumn moonlight sleeping upon the sandy bank.
Why seek the ancient river, known for its dark blue wave?
No better stream than this to wash my tassel I need crave.

In this poem the dark blue wave is the original Tsanglang. It is mentioned by the ethical writer Mencius. Confucius heard a boy singing, "Is the water of the Tsanglang river clear, I can wash the tassel of my hat. Is it muddy, I can wash my feet." "Hear," said the sage to his disciples, "what is said in this song. He will wash his hat tassel in the river when it is clear, and his feet when it is muddy. Things are as we make them. When men, families, and nations act so that observers must look on them as muddy, they will treat them as such. If men injure themselves, they lay themselves open to be injured by others. If their acts are morally clear, men will honour them as such. The river is an image of man. If clear, it will be applied to honourable uses, if muddy, less honourable duties will be assigned to it."

The poet calling out three times was as if appealing to the inspiration of the genii to come to his assistance in making the poem.—*H. J. Edkins, M.D.*

**Newspapers of the World.**—The statistics of the newspaper press in all countries were collected and tabulated by "La Nature" during the International Exhibition at Paris. The facts given show that Germany has the honour of publishing the largest number of periodicals in Europe, these numbering 5,500, of which 800 are dailies. Journals devoted to special religious dogmas, creeds, and scientific theories abound more in this than in any other country. The oldest German journal is the "Gazette des Postes" of Frankfort, founded in 1616; the most widely circulated, the "Berliner Tageblatt," issues but 55,000 copies. After Germany comes England, which publishes over 3,000 newspapers, 809 of which are dailies. France follows with a nearly equal number, of which only a quarter are dailies, bi-weeklies, or tri-weeklies. Italy holds the fourth rank by publishing 1,400 journals, 200 of which appear at Rome, 140 at Milan, 120 at Naples, 94 at Turin, and 79 at Florence. Of these 170 are dailies. In Austria-Hungary there are 1,200 journals, of which 150 are dailies. So far as other countries are concerned, Spain follows with 850 and Russia with 800, 200 of the latter appearing at St. Petersburg and 75 at Moscow. In Greece journals are proportionately numerous, every little market town and village having one. Athens publishes 54, all of which are dailies. In Switzerland there are 450 journals published, and Belgium and Holland furnish an almost equal number. In Sweden, Norway, and Portugal journalism is but little cultivated, while in Turkey it is quite active. In all, Europe is credited with over 20,000 journals. Turning to Asia, the figures show that here no fewer than 3,000 newspapers are issued, most of which appear in Japan and the British Indies. China is very poorly supplied, having but the "King-Pau" (official journal of Pekin), which issues three editions a day on paper of different colours, and one journal at Shanghai and one in Corea. Japan, on the other hand, publishes 1,500 journals. Africa makes but a very poor show, having but 200 newspapers, 30 of which are published in Egypt, and the rest in European colonies. America has a large share of representation in the world's Press, the United States alone issuing 12,500 papers, 1,000 of which are dailies. There are papers in all the languages spoken by the polyglot population of the States. In Canada 700 journals are published, many of which are French. Besides Mexico and Brazil, in which quite a large number of papers are published, it may be stated that the Argentine Republic has 60 journals. Australia is credited with 700 papers, all of which are English. It used to be the boast of a famous patent medicine dealer, Mr. Holloway, that his advertisements appeared in every newspaper in the world, and possibly that was the case thirty or forty years ago, when copies of all these papers could be seen on his premises, then near Temple Bar. But to read all papers, or to collect them, is an impossibility now. The British Museum itself could hardly contain them in its spacious newspaper department.

**Cocoa-nut Butter.**—The United States Consul at Mannheim, in his last report, refers to a discovery by German chemists in the cocoa-nut of a fatty substitute for butter. Immediately after the discovery a firm was established in Mannheim for the purpose of manufacturing the new article, to which it has given the name of cocoa-nut butter. Although in existence only a year, it is unable to meet the constant demands made on it. The nuts come mainly from the South Sea Islands. The new butter is of a clear, whitish colour, and is said to be better adapted for cooking than table purposes. It is neither disagreeable to the taste nor smell. At present it is chiefly used in hospitals and other State institutions. In Germany there are about 50 factories engaged in producing margarines and other artificial butters.

**Sofia, the Capital of Bulgaria.**—An American who visited Sofia last year, to break the journey from Vienna to Constantinople, was greatly struck with the Bulgarian capital. "I have never," he says, "seen such a curious blending of the Orient and the Occident as here. The part of the old town which has been spared has narrow, irregular streets, low houses, small shops, and all the characteristics, including the people and their dress, of a Turkish town in the remote interior, while alongside of it are all the features of a rapidly growing town in one of our Western States—broad streets recently laid out, with new buildings going up on either side, and everything in sharp contrast to the old town. Prince Ferdinand was absent at the time, but he seems to have secured the confidence and esteem of the Bulgarians, while they still cherish a strong affection for Prince Alexander, the predecessor of Ferdinand, who was compelled by Russia to leave the country. The Powers, on account of the opposition of Russia, have not yet acknowledged Ferdinand as a regularly elected prince; but the Bulgarians do not seem to care so long as he is left without molestation. Bulgaria has shown a great amount of pluck, and her advance to this degree of national independence has been a surprise to the civilised world."

**Death-rate in Great Cities.**—The death-rate in cities where records are kept, varies from the maximum of 41 per 1,000 at Cairo, 34 at Alexandria, 30 at St. Petersburg, to the minimum of 16·82 at Philadelphia, and 16·63 at Washington. London has a good position in the mortality, 22; Edinburgh, 20; Dublin, 28. Paris, Vienna, New York, and Naples are all about 27 per 1,000. In India, Calcutta is given at 31·85, and Bombay, 25·16. Melbourne is only 18·83, and Sydney, 19·52.

**Printing as an Art.**—There is a great deal of nonsense talked by people who have little knowledge of the practical art of printing about the superiority of the style in which the books of the early printers were produced to that of the present-day printer. A well-known artist and designer was recently reported to have said in the course of a public lecture that "machinery may have improved printing as a trade, but it declined it as an art." This is altogether erroneous; there never were such beautiful and really artistic books made as at the present time. The Guttenberg Bible is often pointed out as a specimen of printing such as his successors even centuries after could not achieve. The illustrations certainly were very fine, but in regard to the printing

it may safely be said that no modern publisher would accept such work from his printer. Baskerville is often similarly belauded, but those who have examined his work know that it would now be considered second or third rate. Illustrations such as are common to-day could not by any possibility be done by hand without machinery. The majority of this very artist's exquisite designs would be useless if there were no machines to work them on. Without speaking of cheapness of impression, leading to large sales, which alone can remunerate such an artist, there is absolutely no hand-press that would print many of the larger pictures. The art of printing has advanced by leaps and bounds since machinery was introduced, and the machine is as superior to the press in the quality of its products as the railway train is to the stage coach in regard to speed, safety, economy, and comfort in travelling.—*The Stationers' Journal.*

**Through Central Asia.**—The following account of M. Bonvalot's tour in Central Asia is taken by the Paris "Figaro" from a letter from the traveller himself. He is accompanied by Prince Henry of Orleans, the eldest son of the Duc de Chartres. They have safely reached the Russo-Chinese frontier, and when the traveller wrote were about to cross into Chinese territory. M. Bonvalot's present object is nothing less than to make his way into Tonquin across China. The following is his proposed itinerary—from Omsk to Semipalatinsk, then to Bakti, next to Chuguchak, and thence onwards in succession through Chicho, Manas, Urumtsi, Karashar, Korla, by the course of the Tarim and Lob Nar, to Karkalik, across the Tchamuen Tai by way of Naichi Gob to Koukon Sar, Tsamdo, Batang, Yunnafor, and finally Tonquin. M. Bonvalot ends his itinerary with the following reflections:—"A sufficiently hazardous task, perhaps incapable of execution. In a word that is our ideal, but complications and accidents may perhaps compel us to modify it. For the present we hope to reach China as quickly as possible. The approach of winter on the higher plateaus of Tibet frightens me a little, and makes me long to be there."

**A Waterloo Veteran.**—Towards the close of 1889 Lieutenant-Colonel Basil Jackson, veteran, died at Ross, Herefordshire. He attained the age of ninety-four in June, and had had no illness up to the last week in September, when he took to his bed. The deceased was born in Glasgow in 1795, entered the Military College at the age of thirteen, and obtained an ensigncy in a Line Regiment when not quite sixteen. In 1814 he was employed obtaining barrack accommodation for the English soldiery in Belgium. He served through the Waterloo campaign, and was subsequently chosen by Sir Hudson Lowe to accompany the Staff Corps to St. Helena. About eighteen months before the death of Napoleon Lieutenant Jackson left St. Helena, then served in Canada, and for the next twenty years was Professor of Military Surveying in the East India College at Addiscombe. He retired from the army on being made a lieutenant-colonel.

**Moorish Pilgrims to Mecca.**—The British Consuls in the different ports of Morocco in their annual reports invariably devote a paragraph to the pilgrimage to Mecca during the year under review as an important feature in the history and trade of the district. The Consul at Mogador, in his latest report, brings it in between "currency and exchange," and "fisheries," and gives some interesting information with reference to it. Even in these days of steam the pilgrimage is a long and toilsome one; the path to the honourable designation "Hadj," which is coveted by every pious Moslem, is not one of roses. Sometimes four hundred or five hundred pilgrims start in the year from Mogador *viâ* Alexandria for Mecca, and similar numbers from the other Moorish ports. The proper time for departure is as soon as possible after the great feast which celebrates the close of the Ramadan. Like other Mohammedan feasts, this is movable, and occurs about eleven days earlier each year. The steamboat companies charge the pilgrims forty-eight shillings to Alexandria, whence fresh arrangements have to be made for the sea transport to Jeddah, and then by land to Mecca. They are usually carried on deck or in the hold, and as the fare does not include provisions much hardship must be endured by many of the poorer pilgrims, who often sell almost all their goods to raise the comparatively large sum required for the passage. From their dirty condition they are not favourite passengers with the other occupants of the vessel. They do a little trafficking on their return in retailing to the faithful at home sundry little articles, curiosities, scented aloe-wood, and incense from the Holy City. The pilgrimage may now be accomplished in four months, though six are often taken. Many of the older and weaker pilgrims die on the road. In years of famine, or when there are reports of quarantine in the East, few or no pilgrims go, and when the time of the feast falls before the completion of harvest but few of the rural population can get away from their agricultural occupations.

**Steel Pens—How First Invented.**—Mr. Joseph Gillott was a Birmingham working jeweller in 1830. One day he accidentally split one of his fine steel tools, and being suddenly required to sign a receipt, not finding his quill pen at hand he used the split tool as a ready substitute. This happy accident led to the idea of making pens of metal. It was carried out with secrecy and promptitude, and the pens of Gillott became famous. The manufacture of metal pens has been as important as any invention connected with business and education since that of printing. There are now numerous firms which produce as many pens every day as all the geese in England could have supplied in a year. There is still, however, a large demand for quills and quill pens; but for common use, in these days of universal education, the importance of Gillott's first invention is incalculable.

**National Library of France.**—The National Library of Paris has a far larger collection of books than our British Museum, having about 2,300,000 volumes, whilst ours has little above 1,500,000. The reading-room in the French library is even more frequented than ours. Besides a room for very popular reading, there is at the Paris National Library a beautiful hall called the *Salle de Travail*, the visitors to which must have an easily-procured card of admission. An immense apartment it is, lighted by cupola-shaped sky-lights, with rows of books surmounted by decorative frescoes, with desks and chairs for over four hundred people, with the officials on a platform overlooking all, and behind them the glass doors leading into a huge magazine, where no less than 800,000 volumes are stored under a single roof.

**Something Wrong at the Mint.**—Whatever may be thought of the artistic taste of the Jubilee coinage, it is certain that the mechanical part of the issue is not so good as in former times. Complaints are frequent of the imperfect impressions both in gold and silver pieces, and the number of cracked sovereigns is considerable. The metal may be perfect, but the moulding should be inspected.

**The Sassoon Family.**—The Queen having conferred a baronetcy on Sir Albert Sassoon, the following facts may be found interesting. The head and founder of the house of Sassoon was Mr. David Sassoon, a native of Bagdad, who married first a Miss Joseph of the same place, and became the father of Albert Abdallah David (the present Sir Albert), Reuben, Arthur, Solomon, Frederick, and Sassoon Sassoon. David was the recognised leader of the Jews in his native city, and when he emigrated with his family to Bombay (though he sent most of his sons to be educated in Europe), he took the same position by reason of his great munificence, and his great wealth. He had established a great business as banker and merchant, having connections in China, London, and the Persian Gulf—opium being reported to be the staple of their trade. When he died he left a vast fortune to his sons—it has been set down at as much as two millions sterling, including property in China—who still further extended the business, and Albert succeeded his brothers Arthur and Reuben in coming to live in London. Albert distinguished himself in Bombay by continuing his father's princely benefactions. In consequence of these services to the second greatest city of the British Empire, the first greatest city bestowed on him its freedom in 1873, the Queen having in 1872 knighted him by patent. Previously (in 1867) he had been created a C.S.I., for his services as a member of the Legislative Council of Bombay.

Sir Albert, who lived at Lancaster Gate up to a few years ago, now resides, when in town, in Kensington Gore, his Brighton residence being at 1, Eastern Terrace. Sir Albert, who has the Persian Order of the Lion and Sun, is now seventy-two years of age, and remains the head of the Eastern Jews. He married, in 1838, Hannah, daughter of E. Moise, Esq.; but his wife, unable to bear the English climate, habitually lives in Sans Souci, his palace at Bombay. Sir Albert's son Edward married a daughter of Baron Gustave Rothschild, of Paris. Mr. Reuben Sassoon, who is even more of a society man than his brother, is, like him, a Vice-President of the Anglo-Jewish Association, and resembles him in his generous instincts. He married the sister-in-law of the late Dr. Artom, the Chief Rabbi of the Spanish and Portuguese Jews in London, and lives in Belgrave Square. Mr. Arthur Sassoon and Mr. Leopold de Rothschild married two sisters. Sir Albert has lately had the Duke and Duchess of Fife as his guests at Brighton.

**Gravelling Trustees.**—In the discussion about asphalte and other slippery pavements we wonder that no reference has been made to "the Gravelling Trust." This was a bequest by Miss Lisetta Rist, of Stratford, who left £1,500 in trust for scattering gravel and sand on the streets to save horses from falling. The fund must be of more value at this date, but seems to lie dormant. This lady, along with a sister, used to scatter the gravel from baskets carried by themselves, and they took special charge of the steep roads near Tower Hill. An account of the kind ladies, and of the Gravelling Trust, was communicated to the first volume of the "Boy's Own Paper" (p. 227) by the late Sir Charles Reed, Chairman of the London School Board.

**King Log and King Stork.**—In Walter Crane's clever and amusing book of "Æsop's Fables for Children" the old story of the frogs and their king is thus told—

> "The frogs prayed to Jove for a king,
> Not a log, but a livelier thing.
> Jove sent them a stork,
> Who did royal work,
> For he gobbled them up, did their king."

The moral added (whether by Walter Crane, the artist, or by W. J. Linton, the versifier, we know not) is DON'T HAVE KINGS.

This republican sentiment reminds us of the anti-monarchical opinions of the famous Dr. Adam, Rector of the Edinburgh High School, in Sir Walter Scott's boyhood, and author of the "Ancient Geography," "Roman Antiquities," and other classic books bearing his name. He was a learned and good man, but a sad radical in those loyal times. Once at a public examination, in presence of the Lord Provost and other magnates, he asked a boy the Latin for a king. "REX," said the boy. "Is there not another name for a king?" "TYRANNUS," was the answer. "Right, sir," said Dr. Adam, with peculiar emphasis.

**Antiquity of Man.**—Sir Richard Owen, the great naturalist, told the following anecdote to Sir Adam Black, M.P., publisher of the "Encyclopædia Britannica," when dining with him at Richmond Park. In excavating a dock at Newcastle-on-Tyne they came upon an ancient forest. The trees were petrified on one side, with hard dark wood within; but the most remarkable part of the discovery was that one of the trees was cut in the trunk by a tool, and by the hand of man, which the engineer in charge of the works said must have been done thousands of years before the creation of man in Paradise. Owen was sent for, and at first was puzzled. He was told that chips of wood had also been found. This excited the professor's suspicion, as he thought that the sea at an early time must have washed the chips away. The engineer, however, insisted that this was a proof of England being peopled long before Adam's time. Next day a navvy called Darby Joe, who had been employed at that place in working for a railway, was brought to the tree, and asked if he knew anything about the cutting on that trunk. "That's ma cuttin'," said he. "And the chips?" "Them's ma cuttin', too," and added that the top of the tree should not be far off. Professor Owen offered half-a-crown to any man who should find it first, and it was soon forthcoming. The story is told in Adam Black's "Life." Professor Owen was not so easily taken in as was a pupil of Sir Charles Lyell, who, on some ancient pottery being found some hundreds of feet deep in the Delta of Egypt, calculated that tens of thousands of years must have elapsed since that pottery was made, judging by the annual depth of the Nile deposits of mud. It was soon afterwards discovered that the pottery lay at the bottom of a very deep well!

**Toleration.**—The following is the celebrated passage of John Locke on toleration, of which little was understood before his time, and even long after. "No person has any right, in any manner, to prejudice another person in his civil right, because he is of another church or religion. All the rights and franchises that belong to him as a man or as a citizen are inviolably to be preserved to him. . . . If we may openly speak the truth, and as becomes one man to another, neither Pagan, nor Mohammedan, nor Jew ought to be excluded from the civil rights of the Commonwealth because of his religion. The Gospel commands no such thing. And the Commonwealth, which embraces indifferently all men that are honest, peaceable, and industrious, requires it not."

Milton did not go so far as this, saying that Roman Catholics ought not to have entire toleration, inasmuch as they profess allegiance first to a foreign Power, and also because they can be so easily absolved from their oaths.

**Döllinger's Testimony on the Vatican Decrees.**—By the lamented death of Dr. Döllinger, the leader of the Old Catholics, the Christian Church has lost one of its ablest and most learned defenders. Against the new departure from the creed of the Roman Church under Pius IX he maintained a strong protest. He thus wrote to the Rev. Dr. Nevin, of the American Episcopal Church in Rome, from Munich, May 4th, 1879: "Nobody possessing a scientific culture of mind can ever accept the decrees of the Vatican Council. Having devoted during the last nine years my time principally to the renewed study of all the questions connected with the history of the Popes and the councils, and, I may say, gone again over the whole ground of ecclesiastical history, the result is that the proofs of the falsehood of the Vatican decrees amount to a demonstration. When I am told that I must swear to the truth of those doctrines my feeling is just as if I were asked to swear that two and two make five, and not four."

**Death Rate in London.**—The ordinary average death-rate in London is about 20 per 1,000; but in the week when influenza was at its height the rate was 32·4 per 1,000. Of 2,747 deaths 715 were referred to bronchitic complaints, the usual number being 352; and of fatal cases of pneumonia there were 253, the usual average for the same week being 140.

**Nurses' National Pension Fund.**—The bonus fund from subscribers, apart from contributions, amounts to about £36,000. A gift of £10,000, contributed by a hundred persons, was announced at the beginning of this year.

**Burmese Women.**—In replying to an address presented at Mandelay Prince Albert Victor paid a neat compliment to the Burmese ladies who had taken a prominent part in the public welcome to the grandson of Queen Victoria. "It will, I feel sure, be additional gratification to her Majesty to hear from me how very active a part the women of Burmah, owing to the excellent and enlightened social position accorded to them, have been able to take in the loyal manifestations of welcome with which, as a member of her Majesty's family, I have been greeted ever since I landed."

**Horticultural Society.**—Since the removal of the society from its modern site at South Kensington to the old historic garden at Chiswick fresh energy has been shown in its experimental and practical work. Standard and typical varieties of vegetables are grown for comparison with new varieties. Exhaustive trials of certain classes of vegetables are to be made every few years in rotation and descriptive reports made. In the floral department are to be included all plants and flowers of a distinctively decorative garden character, whether for cultivation under glass or out of doors;

but only a few classes can be illustrated each year. Some idea of the extent of the work carried on at Chiswick under the superintendence of Mr. Barron may be gathered from the following statements in the report for last year: "Trial has been made of 104 varieties of potatoes, 50 of broccoli, 108 of vegetable marrows, pumpkins, and gourds, 30 of onions, 30 of Brussels sprouts, and 41 of peas. Among flowers trial has been made of 270 varieties of garden annuals, 66 of China asters, 20 of stocks, 190 of dahlias, besides zonal and other pelargoniums, Lemoine's new hybrid gladioli, heliotropes, iris, etc. Ivies, of which the society possesses a very fine collection, have been specially examined and classified. Of chrysanthemums 800 varieties were grown, and these not only added very materially to the display at the Chrysanthemum Centenary Conference, but, from not being so severely disbudded as is usually the case in producing show blooms, the plants themselves, as well as the blossoms, were greatly admired. A new hybrid tomato, considered to be one of the best in cultivation, has been raised by Mr. Barron, and the seed distributed amongst the Fellows."

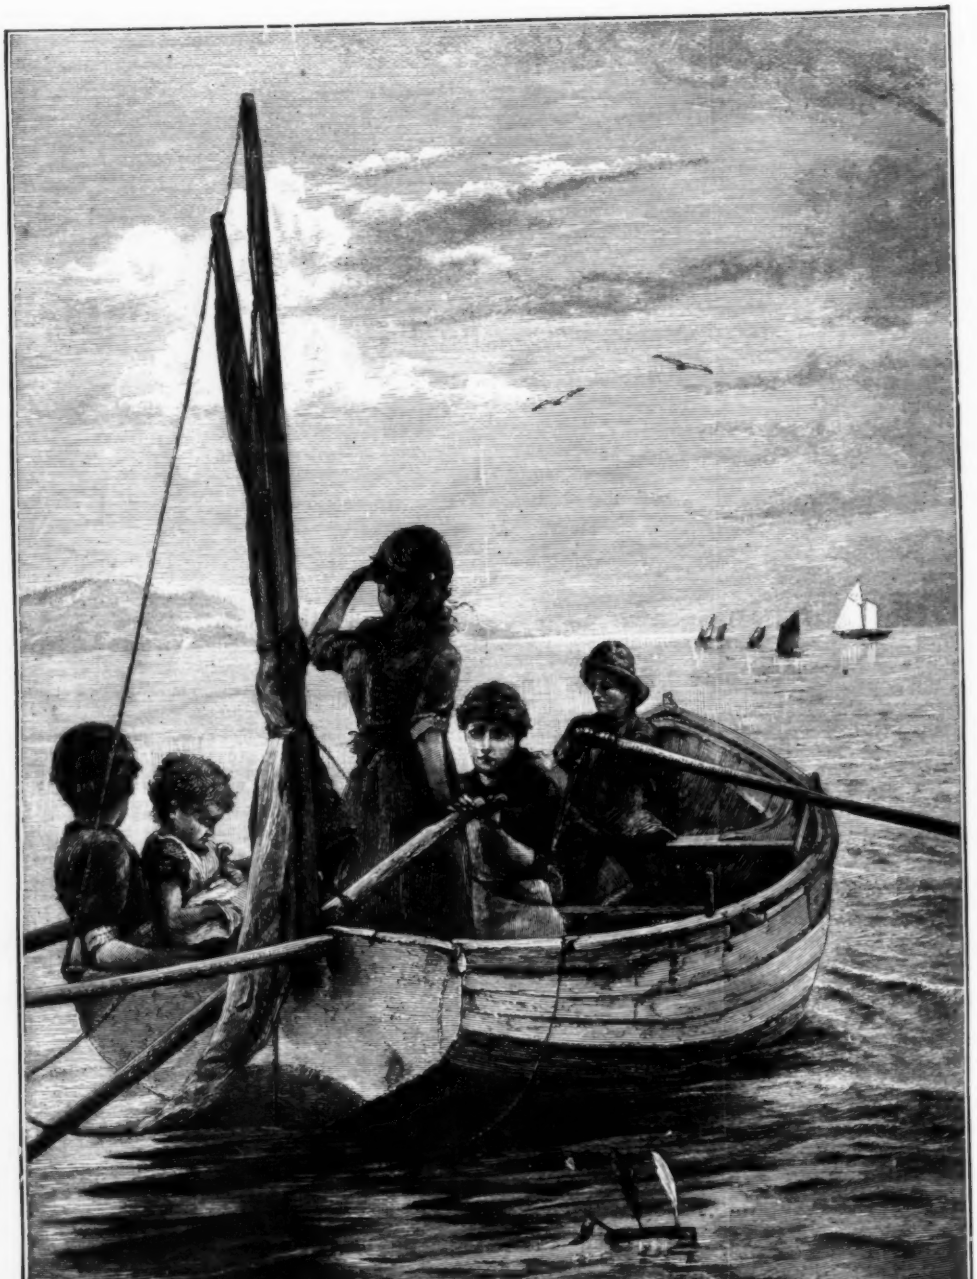
**Masonic Principles.**—In his reply to a Masonic address, on the occasion of inaugurating a new hospital at Bournemouth, the Prince of Wales expressed in a few but happily chosen words the principles by which Freemasons profess to be actuated. This speech was as follows:—"Worshipful Masters, Wardens, and Brethren,—I thank you very warmly for your address and for your fraternal greetings on the occasion of my visit to your town. I highly approve of the truly Masonic sentiments which you express, and I assure you that I rejoice to be able to take a leading part in a ceremony having for its object the inauguration of a building which has been erected for the relief of the sick and suffering poor, relief and charity being the two cardinal virtues in our craft. I am proud to have an opportunity of meeting the members of a lodge which can boast of so ancient a history as your mother lodge Hengist, and I appreciate very sincerely your kind reference to the Queen and the Duke of Sussex, my great uncle, and a predecessor in the distinguished office which I have now had the honour of occupying for so many years."

**Banking in London.**—Alderman Sir R. N. Fowler, M.P., at a meeting of the Institute of Bankers, gave an interesting review of the history of banking in England and London. Sir Thomas Gresham was the first to suggest it to Queen Elizabeth that she should raise loans from her own subjects, instead of from Lombardy or German Bankers. In London, Childs' Bank dated from 1620, Hoares' from 1680, Strachan's from 1685. The Bank of England was not established till 1694.

**French Drink Bill.**—The Anti-Alcohol Congress in Paris brought out many serious facts, one of which is that the dram-shops in Paris have risen since 1880 from 24,000 to 29,000. In thirty years the consumption of alcohol has been trebled, and as much as 36,000,000 gallons has been manufactured out of potatoes for the French market. This shows an average yearly consumption of over twelve quarts per adult man. The consumption of alcohol doubled between 1875 and 1885. It attains its maximum in the colliery districts of the Nord, while strangely enough in the wine countries of Southern France the consumption is lowest. However, deaths from alcoholism are much fewer in the north of France than in either England or Russia. The Congress voted a resolution to the effect that inebriates should be treated as mad, and that prison-hospitals should be created for them.

**The "Mont-de-Piété" in Paris.**—The annual report of the board which administers the *monts-de-piété*, or establishments at which money is lent upon objects placed in pawn, is to the effect that during the year 1888, the latest yet published, 1,510,959 articles were pledged for a sum of £1,425,357, and 780,384 objects pledged anew for a sum of £845,445. The number of objects sold was 177,415, and they produced a total of about £180,000. The greater part of the articles pledged were for sums of from six to ten francs, and then came the articles pledged for from three to four francs. Only 1·77 per cent. of the whole amount lent was in sums between £20 and £40, while the proportion on pledges over £40 was but 1·23 per cent. The board of directors calculates that the total reduction to persons who have pledged goods within the last two years, brought about by the gradual diminution of the rate of interest, is at least £68,000, and they propose to obtain the sanction of the next French Chamber to two other measures—one for loans upon negotiable securities, which will be of benefit to small investors, and the other for the reorganisation of the system of appraising the articles offered in pledge.

**A Right Imperial Message.**—The German Emperor sent a noble message to the British nation and army, through Lord Wolseley, Adjutant General, on the death of Lord Napier of Magdala, gracefully signing his letter as an admiral of the British fleet:—"The British army has just lost one of its ablest generals and bravest soldiers. I deeply grieve for the loss of excellent Lord Napier of Magdala, and I hasten to express my most heartfelt and sincere sympathy to you and to the whole British forces. His noble character, fine gentlemanly bearing, his simplicity and splendid soldiering, were qualities for which my grandfather and father always held him in high esteem. Please convey my feeling of sincerest regret to the Queen and the army.—WILLIAM, I.R., Admiral of the Fleet."



**Jane Taylor, of Norwich.**—In our recent paper on Robert Browning reference was made to his poem "Rephan," which is described in his volume as founded on a story by "Jane Taylor, of Norwich." Mr. Gilbert writes to the "Athenæum," that of the eminent Norwich family he does not remember one of the name of "Jane," and says he thinks that the story referred to is that called "How it Strikes a Stranger," by Jane Taylor, of Ongar.

**"The Order of Release."**—The painting by Mr. Millais which bears this name, and of which we give a reproduction in our Frontispiece this month, was painted in 1853, and exhibited the same year at the Royal Academy. It belongs, therefore, to the earlier series of his works, but to the period when his fame was already established, and the pre-Raphaelite school had made good its claim to respect. "The stamp of actual truth," it was said by Mr. Andrew Lang, "is on it, and if ever such an event happened, if ever a Highlander's wife brought a pardon for her husband to a reluctant turnkey, things must have occurred thus. The work is saved by expression and colour from the realism of a photograph. The woman's shrewd, triumphant air is wonderfully caught, though the face of the pardoned man is concealed like that of Agamemnon in the Greek picture, but by a subtler artifice. The colour of the plaid and the gaoler's scarlet jacket reinforce each other, but do not obliterate the black and tan of the collie. The good dog seems actually alive. The child in the woman's arms is uncompromisingly 'Hieland.' The flesh painting, as of the child's bare legs, is wonderfully real; the man's legs are less tanned than usually are those of the wearers of the kilt. Perhaps he has grown pale in prison, as a clansman might do whose head seemed likely soon to be set on Carlisle wall. As a matter of truthful detail observe the keys in the gaoler's hand, the clear steel shining through a touch of rust. The subject and the sentiment, no less than the treatment, made this picture a complete success."

# SENIOR AND JUNIOR

## A COUNTRY TOWN CHRONICLE.

BY LESLIE KEITH, AUTHOR OF "GREAT GRANDMAMMA SEVERN," 'THE CHILCOTES," ETC.

### CHAPTER XIX.—THE DEATH OF HOPE.

HE HAD THE LOOK OF A MAN WHO WAS AT BAY.

THE pair across the street on whom dark days had also fallen did not seek to mend matters in the simple sentimental fashion of Mary Hallett.

The shadow lay the deeper there because it was as completely ignored as if it had not been. This reticence was not like a man of John Mellish's bluff outspoken temper, but care moulds us into queer shapes, and makes us what our neighbours are pleased to call inconsistent.

When he came up at night from the bank, and spread his elbows on the board and buried his head in his hands, he had the dogged look of a man who is at bay; but he said never a word. Hannah, too, was silent but for the click of her knitting-needles. She had not the foolish, timorous fibre of her sister-in-law; she was not of the order of women who can bear anything but to be shut out from wedded love; it was not to her husband and home, but to her own kith and kin by birth, that the force of her nature went out in something of a rude and elemental tenderness.

"I married to serve them," she thought, and though she was not a woman who reflected, she could not but wonder whether her sacrifice were not like to turn out a disaster.

Without any hint of her intention, she tied on her bonnet one day, and set out for Chalk End. John Mellish saw her go, and held his peace. He had the kind of forbearance for her that a giant has for a creature whose small stature makes a claim on him. He was keen to spare his little companion while he could, and there were moments when he was sustained by the delusive

hope, common to all men in his circumstances, that some kind stroke of luck would of a sudden mend matters, and make surrender needless.

While he saw Hannah punctual over her household duties, practising diligently her knack of tidiness in the parlour, and her skill over the kitchen range, he held easily enough that she guessed nothing. The foolish man forgot to reckon on the silence of his big house—the dining-room where nobody shared the good cheer, the punch-bowl buried in the cupboard, the cards hidden in a drawer, waiting for visitors who never appeared. There were visitors, to be sure, many of them, who came up the clean polished steps outside, but they never ascended higher than the bank, where they arrived on a business that made John Mellish wince and shiver as he heard their footsteps and voices behind the partition. Hannah heard them too, and in her dumb way she understood.

She walked all the way to Chalk End. The distance was nothing to her—a country woman born and bred; and her light active figure seemed to devour the road as she went steadfastly on.

She was a curious little person, curious enough to make one turn and look at her, if one met her on the bare unadventurous Eastshire highways. Her figure was almost meagre in its slim proportions, and her dress was scanty and strangely lacking in any sign of feminine vanity—a skirt of some homespun stuff, a jacket of an archaic cut, and a bonnet tied securely over the tightly braided hair. After all, there was nothing that spoke for her but her eyes—strange eyes that glowed with a dark fire, suggesting a far more intelligent soul than that which lurked behind them.

She came in sight of the farm about midday. Even before she reached it she, whose life was centred here, felt as if a breath of its decay came to meet her on the warm autumn air. And yet even its ruin was accomplishing itself in a slow and leisurely way—slow as the changing tints in the elms and oaks, sluggish as the blood in Caleb Moss's veins.

She opened the yard gate, lifting the loop of rope that replaced the latch. There was a scattering of cocks and hens at her advance, but no sign of any human presence. Even the pigs were for once grunting in the straw, unwatched by Caleb's meditative eye. Hannah looked about her, and drew in her breath sharply, with a widening of her nostrils. The ivy was torn, and hung forlorn from the east wall; a pane in the window was broken, and the wind sucked the curtain hanging there idly in and out; the paint had rotted off the fences; the weeds rioted in the garden of the sluggard—everywhere declension, apathy, and silence—silence that is as incongruous in a farmyard as is noise in a churchyard.

She went round to the back of the house, where the kitchen-garden lent itself to the general neglect, and there she saw Lavinia Moss.

Lavy was seated on the doorstep, the open door behind her making a black background for her strong young figure.

She sat in what might have seemed at first sight a slothful content, waiting for the travelling of the sun towards her. But it was not in Lavy's nature to be idle, and anyone who knew her would have understood that it was despair and not pleasure that had seated her there.

But Aunt Hannah would not recognise this.

"Girl," she said, in her broadest vernacular, "what be you doing there? Be there naught for you to do but hang you fitten i' the sun?"

Lavy looked down at her feet as they stuck out before her, then she raised her head and looked at her aunt.

"There's nothing else to do," she said.

Hannah came a step nearer.

"The ivery's torn fro' the east gable," she said, "the window i' the keeping-room's broke, the hulve—"

Lavy got up slowly. She checked this recital with a motion of her hand. She looked down at the little stiff, prim figure with the blazing eyes, and a kind of sad respect was in her look.

"You did your best," she said; "you did the work of ten women when you were here, but even if you had been here these five years past you couldn't have helped things from going down, down, down. Father knows I did what I could to follow in your steps. I worked"—she held out her strong hands as if they bore witness to this truth—"I slaved, I tried it for five years, and after that I gave it up—I took my pleasure. Why shouldn't I?" she asked, with sudden fierceness. "I might have died here at my post; but living or dying, there was no bettering of things. If father had put in a bailiff years ago," she said—"but there, you know father," she smiled a dreary little smile, "you his own flesh and blood—though you are as unlike as fire and water. You ought to have been the man, Aunt Hannah," she said, with sudden conviction. "But it's Caleb Moss and not you that owns Chalk End; and so the ivery's torn, as you say, and the hulve is chocked, and the window's broken. And it's no more use mending them than it is stopping the Thames with your two hands; and that's the hammer on't"—she ended with a provincialism that seemed to give the final note to her argument.

Hannah looked at her as if she would read her soul with those fierce eyes of hers, but she said nothing. There was something in her absolute silence as pathetic as tears and lamentations would have been in another order of woman.

She turned her back on the house and went slowly down the paved path in the middle of the rotting kitchen-garden, looking to the right and left of her, missing nothing of its decay.

Lavy followed her, silent as she. They made the circuit of the garden, and came out upon the farm-buildings beyond. The barn-door swung loose upon its broken hinges, a rent in the roof made a window for the bright September sky to shine down on the nakedness within. Where were the stores that should have been garnered here? Hannah Mellish paused on the threshold and looked up at that gap where the summer sun had peeped and the autumn rains had descended and where the winter storms would spend their fury, though there was nothing they could harm. And from this too she turned away without a word.

And so from door to door she passed in curious silent inspection, Lavy following her with a drooping head and a heart that beat too dully for pain. At the dairy-door she stepped before her aunt.

"Don't go in," she said; "it's—it's cold there stepping out of the heat. You'll take a glass of milk in the house, Aunt Mellish, where it's warmer?"

Hannah faintly shook her head, but she turned away. At the last of the low red buildings the fields began. She wavered there a moment, and for a moment more she stood transfixed; and Lavy, following her glance, saw a figure stretched upon a bare patch which a chestnut had cleared for itself in a field of bearded wheat.

It was but a poor sickly crop that stirred itself in response to the breeze, and it shrank away from the shade cast by the green dome of the chestnut. On a day that was mellow and warmed through and through with the sun it was a pleasant place to lie, and there Caleb Moss lay and dreamed and watched the curl of smoke ascend from his pipe and melt upon the blue, and told himself he was ready for Fate.

"Come, aunt," said Lavy, with a new kindness in her voice, "come in and rest."

She put an arm about the stiff little figure and turned her round, her face set towards the house.

In the brilliancy of the glowing autumn day the dilapidated place had an artistic value—its decay so peaceful, gentle, so ripe of tone and tint, the sun seemed to revel in the richness of the reds and browns as it bathed it. The pigeons from their home in a gable came swooping and wheeling down in flashes of silver; a murmur of doves stole out from the eves like a benediction. If only it had not meant the death-blow to hope in one poor heart!

Hannah walked before her niece into the house, resisting the offered support, still voiceless, still stiff and prim, but for those dark, quick-glancing eyes. It was empty and silent and open as the barn to the eye of day, windows and doors thrown wide, as if the secret of its poverty were no longer worth the concealing.

The younger girls had escaped to the cousinly farm, where care was at least cloaked and hidden from sight. There were signs of their recent presence in plenty—tags of ribbon and finery, bits of girlish vanities that made the absence of their young voices strike with a greater chill on the heart. Hannah looked into all the rooms—into the cupboards; she even vacantly lifted the lid of the old carved oak hutch that stood on an upper landing as it had stood for generations, and Lavy, understanding at last that this was a farewell, stole downstairs secretly and let her be.

When she reappeared in the keeping-room she was buttoning the jacket on her spare, skimpy little figure. Lavy had produced a bottle of cowslip wine and a tall, old-fashioned glass.

"It's all that's left of last year's brew," she said; "you'll drink before you go?"

Hannah took the glass mechanically in her hand, but she set it down untasted.

"It's like drinking to the dead," she said. "I was born here, and I would have died here but that I thought to bring him good by going from it."

A curious spasm crossed her face for an instant, but presently left it rigid as before.

"We are none of us likely to die here," said Lavinia; "unless," she looked at her aunt—"unless somebody buys Chalk End and lets father stay on as a servant—though it would be a poor bargain anybody would get in him," she said, with a frankness that was not meant disrespectfully.

"You'll do better than that, Lavy."

"No," said Lavy, with a sort of quiet violence; "if I know your meaning, it would be doing worse, not better. You may count on that as done with, and never speak of it more. I'll stop on here if they'll have me—those that come after us. Must you be going?"

"I've left trouble behind me."

"There's trouble everywhere," said the girl, bitterly. "I'll go a step of the way with you, aunt."

She caught up a hat that hung on a peg behind the door and signified that she was ready, and they passed out. Hannah went first, walking rapidly and never once looking round—not even when they reached a meeting of the ways where the Melchisford Road trended sharply and shut the farm from view.

"I'll go with you to the Four Want Ways," said Lavy, referring to a further divergence a mile or two beyond where the white roads cross and loop each other over the flat face of the land.

They stepped out together steadily, their faces set straight towards the horizon. They might have been walking for a wager, so unfalteringly did they keep pace with each other.

The jocund charm of the September day, so fresh, so vivid in its play of light and shade, seemed wholly lost on them; but perhaps it was not so. It is difficult to estimate the full force of an affection that has no intellectual power of expression, but though the peasant never talks of scenery, he sometimes breathes in its spirit, and now and then to the finer among his kind it whispers secrets that the cultured may easily miss.

At the Four Want Ways Lavy stopped precipitately and held out her hand. The action had its own significance, for as a rule a careless nod sufficed for their farewells. Their liking for each other, as for Nature, was an uncultured instinct. Hannah put out her small, hard, work-worn hand and met the clasp of Lavy's strong fingers, and then she turned away and walked on alone towards the town. It was the true farewell of her old home she was taking that day; five years before she had left it as a bride. She had forsaken it, it is true, but only in an outward sense, for all that she possessed of heart and desire and hope were bound up with it still, and that hope was dead.

Lavy stood a long time idly looking after the little figure plodding unflinchingly on. Deprived of this heroic little person's presence and the stimulus of her fierce example, Lavy's sense of discouragement returned upon her. Her steps lagged, she felt tired and sick, and bitterly in

distaste of her life. To go back and watch the sinking of the home into ruin seemed so poor a thing to do—to sit with folded hands a cowardly acquiescence. And yet, as she had said before, there was nothing else to do. She envied while she despised her father. If only she too might have shut her eyes and ears and told herself that it was Fate!

When she began at last listlessly to retrace her steps she noticed on the unbroken whiteness of the road a pony carriage advancing towards her. The pony appeared to be taking an erratic course—now with a wilful onward trot, now pausing to crop the wayside grasses. Presently signals of distress came from the occupant, whom Lavinia now recognised to be Miss Kelynge. She quickened her steps, and running forward arrested the pony midway in a zigzag across the road to a more luscious patch of greenness.

"Oh, Lavy, do help me!" cried Mary, in real distress; "I can't make it stop! It will go on, and I'm so afraid I shall be thrown out!"

"There, he'll stand quiet enough," said Lavy, with a touch of contempt which was an ease to her own heart; "it's the grass on the brew he's after. You sit still, I'll hold him. How did they come to let you out alone?"

"I'm not alone: Hester is with me. She went into the wood to get coloured leaves. I thought I could hold the reins, but the pony is so wild."

"Wild!" echoed Lavy, disdainfully; "a baby could hold him!"

"Yes," assented Mary, shamefacedly; "I am a great coward, I know."

Lavy did not answer. She glanced towards the edge of the wood where Hester Hallett had disappeared. She was entertaining a sudden resolution. Here, where chance had thrown her alone with her rival—the girl whom Andrew was fooling as he had fooled her—was the opportunity for the warning she had resolved upon.

While she was questioning how to begin Mary gave her her chance.

"I never see you now, Lavy," she said, anxious to propitiate her rescuer; "and we used to have such good times together. You never come to the Red House."

"No," said Lavinia, shortly. "I'm not wanted there; and if I was I wouldn't set foot in it."

"Why?"

"Because there is one there that I despise."

Mary looked up into the speaker's face blankly. Her mind worked so laboriously that she was a long time in absorbing the sense of Lavy's words; and even then they left her bewildered.

"Not Hester?" she faltered.

"Not Miss Hallett; I've nothing to say against her."

"Her mother, or her father?" Mary groped feebly in her perplexity, and then suddenly the colour in her sallow face deepened—deepened till it was overspread with a dull distressed red.

"Ah," said Lavy, watching her keenly, "you've come to it at last; there's a name you won't name, and no more will I. There's no need of names where we both understand, and I warn you, Mary Kelynge, if you don't take care he'll give you cause to despise him too—or worse maybe than that, for there's little hurt done when you can stop at despising."

"It's false!" cried Mary, finding words at last in the midst of her confusion.

"It's true, or I wouldn't be here to tell you. It isn't that I want him for myself," she explained, with a blunt honesty; "he's not for me, but no more is he for you. Can't you see," she said, with a kind of rough pity, "it's your money he's after, and not you?—the money that may never be yours. If you should turn out poor, do you suppose he'll go on caring for you and wanting to make you his wife? We women are fools—fools," she said, bitterly, "when we trust a man with our love!"

She seemed to have all at once forgotten her mission of warning. Her eyes were dark and gloomy and absent in the glance with which she swept the landscape as she turned abruptly away, leaving her victim to the mercy of the pony's moods.

She had been cruel, though she had not meant altogether unkindly. She felt no ill-will towards the hapless Mary, and had an honest desire to save her from sorrow, but she could not easily calculate the force of her words upon a nature so limited.

A man or a woman may be dull and yet be sensitive enough; dulness is no anodyne for that sort of trouble. Mary felt herself caught in the clutch of a horrible doubt and dread, and she writhed, but the more because her mind worked too slowly to present her at once with arguments that should shatter Lavy's assertion.

"It's your money he's after." Again and again the words rang in her ears; they seemed to dance on the clear air and mock her as she shrank huddled in a corner of the little carriage, the reins fallen at her feet, the pony straying hither and thither at the bidding of its fancy.

It was thus Hester found her when she came out of the wood laden with its spoils of red and gold.

"Why, Mary," she said, "you will be in the ditch if you don't look out."

She jumped into the carriage, letting her treasures fall in a loose heap, groping for the reins. "You shouldn't let Rorie see that you are afraid of him: it demoralises him at once," she began merrily. Then she turned, and saw by her companion's face that it was something more than a lack of nerve that had blanched and stricken it, and made her shrink and tremble in the corner.

"What is it?" she cried, "has anything happened?"

"Lavy Moss has been here," gasped Mary; "she has been talking to me—"

"Now? while I have been gone?"

Hester stood up, balancing herself with one hand on the back of the carriage, and looked all around her narrowly.

"I don't see her," she said.

"But she was here," reiterated Mary, Hester's disbelief acting as a stimulus to her mind, "and she has been saying dreadful things to me about—" but there she broke off. Not in words

could she put that tormenting doubt that Lavy had sown within her.

"Was it about Andrew?" Hester asked the question gravely, and found her answer in Mary's increased distress.

She did not speak immediately, but after a little, when the trotting of the pony's feet was all the stir there was, she said with something of an effort:

"Mary, if she spoke of Andrew, perhaps she had cause. Andrew is my brother, and I—I care very much for him, but there are young men who must always have someone to amuse themselves with. They don't mean anything, but perhaps they don't know how much they seem to mean, and if Lavinia Moss—" she broke off hesitatingly, feeling how hopelessly difficult was her explanation or her warning, whichever she wished it to be.

"See," she said, glad to divert her own thoughts and her companion's, "how dark it has grown all at once; we shall scarcely get home without a drenching." She touched the pony with her whip, and sent the little carriage spinning over the white road.

It was true as she had said that a great change had passed over the sky—a sort of trouble and blackness was sending the sunshine before it. The day, as so often in that flat east country, had failed to keep its glorious promise, and was ending in sadness.

The greyness overtook a little figure tramping steadily back to Melchisford. The wind had dropped, and its dainty music among the tree-tops was stilled; a fine mist-like rain began to fall, but Hannah Mellish was scarcely conscious that it was wetting her. She was very wet indeed when she reached the bank-house, and John Mellish, coming suddenly out of the dining-room, noticed it.

"You've met the storm," he said; "you're wet."

She looked down at her skirts as if she had hardly noticed the fact before.

"It's beginning to bange," she said.

She came out of her room presently—neat, prim, orderly as ever, and began to take the tea-cups from a cupboard, and make preparations for a meal. Of late the banker had had no appetite for dinner, and seeing that he could be persuaded to take nothing but a cup of tea, she prepared it herself that he might be sure of getting it comfortably. She did not lapse from the smallest of her cares on this night, and he watched her as she passed from the cupboard to the table with a sort of dull wonder.

He knew that she must have found little to cheer her at the farm, and yet she could warm the cups and measure the tea as if she had not so much as a care on her mind.

"If she can comfort herself like that," he thought, "and I suppose some folk can, it won't be so bad," and this reflection made him say as if he would prepare her a little,

"I'm afraid you found Caleb none too cheerful, Hannah, and it's a sad dull home for you to come back to, my girl, and I can't do anything more for him."

She held a cup poised in her hand for a single second before she put it down.

"There's trouble everywhere," she said, briefly, using the words Lavy had already used that morning.

He said no more. He did not know whether to feel repulsed or comforted by her exceeding quietness and self-restraint.

Did she not guess in what deadly sickness of suspense he was living his days?

She knew it all, but she had not a word of comfort for him. That accepted sorrow which she had taken upon her earlier in the day left her numb. She was without power to suffer any more.

### CHAPTER XX.—ANDREW TURNS PHYSICIAN.

IT was not to be looked for that Mary Kelynge should conceal the distress that had held her awake all night, and made the darkness live with voices that kept telling her she had given her heart too lightly to a man who prized it not at all.

For absolute outer command over the emotions we must go to the savage or to his brother, who has had centuries of tradition and culture in which to educate him in control. Mary stood midway between these two, and was as artlessly ready to express her feelings on all occasions as if no binding rules had ever been imposed upon society.

She came down to breakfast on the morning after her encounter with Lavy Moss wearing her shame so plainly on her face that her host and hostess must needs have seen it had they not been busy with cares of their own.

Andrew saw it, and it puzzled him not a little. When he bade her good-morning she shrank away from him as if he had struck her; when he asked her for the marmalade she could scarce still the trembling of her hand to pass him the dish without letting it fall. The bold, full glances he shot across the table seemed to fill her with dismay, yet she must needs encounter them as if they fascinated while they frightened her. Not on the first day of her presence there had she been so full of starts and tremulous quiverings and scared looks as on this, when she had been for months an inmate of the house, and as good as one of the family.

Andrew tried all the expedients which the course of the meal allowed. He made a pretence of wanting anything that happened to be on her side of the table. On another morning she would have cut the bread and poured out the coffee in a pleased flutter, but on this she bungled so hopelessly that Hester had to come to her aid. Hester cast indignant looks at her brother, which he politely ignored. She knew what was going on in that poor slow mind; and though she pitied Mary, she had nothing but indignation for Andrew. If he had truly cared for Mary, he would have seen that she suffered, and had compassion on her weakness.

Of compassion, however, he had none; he

wanted to get to the bottom of the thing, to know what malign influence was thwarting him.

"What on earth is up now?" he asked himself in that moment he gave to the fire and the newspaper before descending to the office. "Somebody has got at her." His thoughts flew straight as a dart to Lavy Moss. She had flung her gauntlet down; she had said it was to be war between them; she had said that she would hurt his schemes if she could. At the remembrance of the scorn with which she had lashed him his hatred rose and raged in him.

"If it was Lavy," he said, "if it was Lavy—"

In that idle space which was all the young man was allowed before the cares of the day began Mary had of late always been his companion. She could not brush his coat or his hat as she would have loved to do, because he required neither when he descended to the lower floor, but she brought his pipe and held the matches while he lit it. She would have allowed him if he had pleased to whiff it in her face, and was humbly grateful for a word or look of kindness.

"Mrs. Hallett and she are made in the same mould," said Mrs. Smee, when the afore-mentioned lunch had given her an opportunity of using her insight on Miss Kelynge; "they are the kind of women who would lie down and let their husbands or brothers walk over them. When you want a mat for your feet, Henry, you must look out for another wife."

A mat for his feet—a slave to obey his slightest whim—this was what he had held her to be. He knew well enough that she loved him; he had discovered long ago that he could lure her with a look. There were times when he had sickened at her docility, and wondered if he could endure her dumb devotion throughout a lifetime; but now that she was making her poor little attempt at resistance he felt that he must win her back.

"There's that idiot Hemmingway has been told to look after her," he said to himself. The prize was too valuable for him to let it slip from his grasp without an effort to retain it. It had never seemed so valuable as now when his possession of it was threatened.

He smoked his pipe in solitude that morning, for the moment breakfast was concluded Hester had whisked her companion out of the room. She put her arm round Mary's waist and carried her off with a backward look of defiance in her big grey eyes, at which Andrew laughed good humouredly.

"I've but to whistle, and she'll come back to me, in spite of Hetty's little wiles," he said to himself, and supported by that conviction he went downstairs, and bore his father's growlings with a great deal of good-nature.

He had one of those fortunate tempers that are not put out by trifles. He bore the parental frettings with a really admirable patience; and though Lavy's scorn had roused him to hatred, Hester's rebellion only made him smile.

"I want you to help me to arrange the flowers," Hester had said to Mary.

With the end of September the choice was growing very limited, and necessitated many excursions round the garden and into the greenhouse. Hester loved those errands, and would fly out and in, knowing the secret haunt of every autumn visitor in that big garden, where the flowers came year by year as expected guests—not mere tenants at the gardener's will, but owners of the soil. Mary plodded after her, conscientious even in the middle of her dazed abhorrence of herself. She plucked yellow and red and blue, following Hetty's light figure like a clumsy belated shadow; but if she thought about the garden at all it was only to think that she must go and leave it—it and all the world she had learned to love.

"Hester," she said, finding it easier to speak when they had got back to the drawing-room, "I think I had better be leaving the Red House."

Hester was standing on a footstool to reach more easily a bracket where she was considering an arrangement of blossoms. The girl had something of an artist's eye, and loved her task. She turned round from this eminence and viewed Mary with astonishment.

"Leave us?" she echoed.

Mary put an irresolute hand up to her lip, as if to hide its trembling.

"I've been here a long time—"

"Do you mean that you are tired of us?"

"No. Oh, no!" cried Mary in eager disclaimer; "that could never be, but it might be you are tired of me."

Hester stepped down from her stool, where she felt that the argument was unequal.

"Have we—any of us told you so—my mother, my father, my brother, or I?"

"No, you are too kind; you would never tell me."

"Ah," said Hester, with a faint irony, "don't be too sure of that! But while we like to have you, will you not stay with us? It has been a pleasure to have you here—a real pleasure," she said honestly. "See how good it has been for me to have a girl friend—I who never had a girl friend before. Is that all your reason for going from us, Mary—your fear that we have wearied of your company?"

The light blue eyes fell before the steady searching glance of the grey ones.

"Where would you go to?" Hester went on, quickly, in pity covering the other's confusion. "Back to Hallett Place? It is too big, too lonely for you to live alone in—you and the family pictures, you and the family ghost; that would be dull company. It is dull here too, no doubt, but it is better than that."

"It isn't dull here. It is not that, it is—" She struggled hopelessly for a moment with her embarrassment, and then yielding to it hid her face.

"It is that you are tired, and that things look dark to you to-day," said Hester, touched to a very kind sort of compassion. "You slept badly perhaps, or had ugly dreams. Broken nights—though you and I know little enough about them—take their revenge next day. You shall come upstairs with me to my little room, where it is quiet, and rest there, and by-and-by when you wake up things will look brighter."

"They can never do that—because—it is all my fault. And I think I'd better go away. There are other places besides Hallett's; there is London. People go to London."

"But not girls like you and me; we should be lost in London."

"That would perhaps be best—to be lost."

"Ah," said Hetty, gaily, "that wandering heir, that mysterious Mr. Frank—what a bad example he has set! So you want to be lost too, and to set all that queer elaborate machinery papa uses in motion on your account? I warn you, Mary, if you lose yourself I shall turn detective and find you."

Hester saw by this time that it was necessary to take the step of making up Mary's mind for her. Someone as a rule performed this office, and though Hester usually refrained from meddling, the occasion required it of her now.

"I think you had better not say anything to father or mother about going," she said. "They have some cares just now, and this would add another to them. Stay with us, Mary, and I promise no one shall trouble you or molest you or annoy you in any way; and in a week or two, if you still wish it, I will ask father to send us both to London. He spoke the other night as if he wished me to go"—she stifled a sigh—"and if that is so we might as well set out on our travels together."

One had only to be resolute in that matter of ordering Mary's mind, and the thing was done. Hester knew it, but she quite forgot to reckon that Andrew knew it too, and was settling with himself downstairs, as he hung diligently over his desk, what colour to give to this poor chameleon of a will.

Hester took the patient upstairs and tended her with the greatest zeal and kindness. It did not wholly displease her when any little ailment thrust a victim into her hands on whom to lavish all her cares. The nursing instinct is not given to every woman, though poetical license allows her to be a ministering angel; but Hester had it in a marked degree. She soothed Mary's thrilling nerves and almost made her forget her shame and affront, though all the while she made as if it were a headache, and not a heartache, she was charming away with her little devices.

The best of women are hypocrites when it comes to an affair of the heart, and think that their blank and smiling looks can deceive all the world. When Mary put her head down on the pillow she comforted herself with the thought that Hester had not guessed the secret of her bitter self-abasement, while Hester as she walked downstairs was saying to herself with vibrating indignation that Andrew should not play with this poor girl, and draw her on, perhaps only to throw her off as he had thrown off Lavy Moss.

But it was an unequal game, and there was scarce a chance that she should win it.

Andrew knew his own power, and had not the smallest fear of the issue. In those months when Mary had been an inmate of the Red House Hester had seen some things and guessed others. The progress of that curious friendship had not been lost upon her. She was convinced now that Andrew only loved Mary's chance of sixty thousand a year, and would not have spent five minutes in her society had it been quite certain she would never possess that comfortable income.

A woman's instinct, even if she has had no experience of her own, is usually a safe guide in these matters. A thousand things had told her that it was not love that was the motive of all those private walks and talks and little confidences; and she was moved to a very honest indignation on Mary's account. It was a shock to a woman of her innocent nature to find that her brother could be so base, so dishonourable, as to win a poor girl's affections for the sake of her fortune.

Hester was twenty, and a simple country girl, all unused to the ways and ideas and the fashion of thought in the world, where, if she had spoken out her sense of contempt for a fortune-hunter, she would only have proved what a very unsophisticated young woman she was.

"If she goes away," thought Hester, "he will follow her. She must stay here, and I will protect her."

Her first idea of protection was to encourage Mary to combat her headache by keeping quietly upstairs, whither her nurse toiled up and down with tempting things to eat and drink, and books and work and all manner of distractions. Thus when Andrew came in to lunch the place opposite him was vacant, and again at dinner-time the same thing happened.

"What has become of Miss Kelynge?" he asked during the course of this latter meal, looking across at his sister. "Has she run away too?"

"She has a headache, and she is resting," said Hester, answering the look unfalteringly.

"It appears to have been rather a sudden attack," he said, smiling, and inwardly amused over this simple device; "but I suppose headaches do come on suddenly sometimes."

Hester blushed a little guiltily, but it was his mother who answered.

"My dear boy," she said, with a fond look at her son, "fortunately you don't know anything about them, or you wouldn't talk so. Imagine anyone bringing on a headache purposely!"

"Oh," said Andrew, "I beg your pardon, I'm sure, and Hester's too. I thought the plea of a headache was one of those recognised little hypocrisies with which ladies ease life—a sort of 'Not at home' to inconvenient folk, in short."

"Poor Mary will be better to-morrow, I hope," said the other innocent Mary, who had no reason to feel guilty. "Hester, have you tried a cold-water bandage? It always does me good."

"Yes, mother."

"Hester has tried everything, I'm sure," said Andrew, with twinkling eyes. "Suppose I turn physician and send her up some chicken?"

Mr. Hallett had appeared to be safe wrapped from observation of this scene in a dark abstraction, but at his son's words he looked up and said, harshly, "Your mother and sister can attend to Miss Kelynge's wants. I don't suppose you will pretend to know better than they what she requires."

"Mary has dined," said Hester, coldly.

Andrew took his snubbing in quite good part, and rattled away gaily about something else. He held the talk in his own hands, for Mr. Hallett relapsed into a moody silence that affected the spirits of his wife and daughter and kept them silent too.

After dinner, when Hester was coming down from one of those many excursions to the prisoner above, she met her brother in the hall. He seemed to be wandering about in an aimless and rather disconsolate manner. She paused to look at him. Could it be possible that he really missed Mary?

"Hetty," he said, "can't that headache get along a little while without you? It's dull for a fellow, with nobody to speak to. Come and play something; you haven't played for ages."

"I'll play if you like," she answered.

Perhaps she had been wrong after all. The mere possibility made her penitent.

She went with him into the drawing-room, where the fire made ruddy leaps of light on the wall. The lamps were not lit, for Mrs. Hallett was with the master in the dining-room.

Hester sat down at the piano and softly touched the keys. The gentle music stole into the next room, where her father sat moodily over his glass of port, and he sighed when he heard it.

Andrew walked up and down the long room, now and then stopping to drum an accompaniment with his fingers on table or chair-back, or to lift and idly examine an ornament.

But presently, as was the way with her when she played, she was carried away with the spirit of her music, and knew nothing of what was passing around her. She did not know, for instance, that Andrew no longer paced in time to her chords, but had slipped from the room, leaving her alone.

In two minutes after he left the drawing-room he was in the library scribbling a little three-cornered note. It was his prescription for the patient upstairs, and, to judge by its effect, a great deal more efficacious than the chicken would have been.

With what a start and flood of colour, with what a trembling and quivering, the poor girl read it!

"I am quite unhappy to think you are ill," it said; "do let me see you, if only for five minutes. I shall wait outside in the corridor till you come."

The maid with whom he despatched the note of course took the news of it downstairs, where the kitchen audience made up its mind that there had been a quarrel and a reconciliation. Andrew had slipped half-a-crown into the girl's hand, and he knew that she would tell no tales upstairs.

The kitchen folk were wrong about the quarrel, and yet, when at last the door of Hester's little sitting-room was timidly opened and Mary came out, it looked mightily as if she were guilty. Yet she came to him, as he knew she would, blushing, abashed, distressed, miserable; yet she came.

"Thank you so much for granting my request," said Andrew, taking her hand with a great deal of devotion. "I've been quite unhappy to think that you are ill."

"I am not ill"

She tried to withdraw her hand, but he held it fast.

"Then it must be I who have done something to displease you, and that makes me more unhappy still."

"Would that make you unhappy?" she faltered.

She looked at him wistfully. She had been crying, he could see, and her poor plain face was all red and tear-stained. It was a very humble and pathetic look she gave him as she asked the question, and he was not untouched by it.

"Poor soul," he thought; "how much she cares for me!"

"Don't you know that yet?" he said, with a great deal of reproach and fervour in his voice. "Have we been friends all these months and you can doubt me still?"

Hester woke up with a start when Andrew laid his hand on her shoulder.

"Have I been playing long?" she asked, coming back from the world of sweet sounds.

"Only an hour," said Andrew, with a laugh.

When Hester went up to her patient at bedtime she was surprised to find her sitting by the fire, her tears all dried, and with quite a blushing content on her face.

"I am better," she said, throwing her arms round Hester's neck; "I am much better, Hetty To-morrow I shall be quite well."

## CHAPTER XXI.—A SMILING MARY.

ANDREW knew that that one day of retirement when Hester did her simple best to cure a heartache, and had wholly failed, as we have seen, had brought matters to a crisis.

But for Lavy Moss and her interference—his language when he thought of Lavy need not be recorded—he might have gone on to the end of the chapter playing that convenient rôle of friend; but to make sure of the prize he had now to abandon that lukewarm attitude, and take on some of the ardour of a lover.

There could scarcely have been an explanation that had not this inevitable result; and in short the ten minutes Andrew spent in the corridor while Hester played to an empty room, more or less sealed him as an accepted suitor.

He might shrug his shoulders, and declare that explanations were "the very mischief"—but all the same, the thing was done; and upon the whole not ill done. With every passing month he had become more boldly sceptical towards that phantom of an heir that still barred the way to Mary's paradise, till now when September was yielding to October it came to be a mere shadow, too intangible to disturb his security.

In a month or two, then, Mary would be rich—rich beyond the wont of women, and more helpless than the most helpless of her sex—in a month or two she would want an adviser, a protector, a steward. And who so able, who with a better claim than he to fill this post? This was how he preferred to look at the future It was a pleasant

and comfortable way to regard it, and he was even able to warm himself over his generosity when he reflected how well and ably he should carry out that trust.

Depend on it, if we were not all willing to practise this gentle hypocrisy with ourselves, half the mean things done in the world would neither be done nor thought. There is scarcely one of us that would not start away in shame from so raw-boned a statement of fact as this for instance:

"I may as well make love to the girl, or pretend to make love to her, since the chances are a hundred to one that she comes in for all that pile. If she doesn't, why there are ways of falling out of love again; and in any case the governor would never give his consent to my marriage with a girl who hadn't a sixpence. After all, the onus of breaking off the match at the last would lie with him."

How much more agreeable, more refined a way of putting it was this other—this picture of a guardian devoted to the interests of his friend!

Mary came down to breakfast next morning with a look on her face that transfigured it. She was no longer miserable, abashed, frightened; and though she still blushed, that red flag that she mounted so readily was not now the signal of distress. She seemed, indeed, to have acquired a modest confidence, as if her self-respect had been awakened, and she at last recognised her right to live and enjoy. The change was so marked that even Mr. Hallett noticed it.

"Glad to see you down again," he said, as he rose punctiliously to shake hands with her. "You slept off your headache, I hope?"

"Yes—no," stammered Mary, looking at him with a kind of wistful appeal; "I am very well indeed, thank you."

She went round the table, and bending over Mrs. Hallett's chair kissed her voluntarily, and passing behind Hester's she performed the same ceremony there. Andrew wondered, with a creeping coldness down his spine, whether she would salute him too, but she contented herself with bringing out one of her deepest blushes as she answered his greeting.

He kept his eyes studiously this morning upon his plate—no more bold glances thrown across the table, no more appeals for the marmalade or the butter; and yet none of those subtle indications of her new mood were lost upon him—a new trimness in her dress, an abandonment of crape, and the substitution of a red bow at her throat; a something less of clumsiness at the waist, a new departure in frills; a new kind of shining in the meek eyes, a new pulse of joy in the heart that set it singing—and all for him, all for him!

Nor were any of these signs lost on Hester. She could have told you, indeed, being a woman, that Mary had sat up at night or risen early in the morning to sew in those tuckers and despoil her bodice of half its crape. Yesterday you would have said she could not pile on crape enough, and here she was breaking out into a daring hint of scarlet, as if sorrow for her were at an end.

What did it mean, and how had twelve hours wrought this miracle? Hester looked at her brother, and found no solution in his face, which for him was solemn, and perhaps even glum, and yet Mary was smiling and saying how bright a day it was for the 1st of October.

Poor Hester, that championship about which she was so valiant was destined to a very short life! As yesterday, when the meal was over she invited Mary to help her. It was not the flowers to-day, but her books, or her music, or her birds perhaps that needed Mary's aid, but for once Mary met the request with an excuse. She reddened, it is true, and spoke with the meekest apology; but still it was a refusal.

Hester walked out of the room with her pretty head held a little proudly. She went aimlessly into the empty drawing-room, and knelt on the window-seat, looking with unseeing eyes on the serene day Mary had praised.

"I give her up," she said to herself, "I give her up. She believes in him; in some way or other unknown to me he has made her do that."

While she was groping with her perplexity over this sudden conversion there flashed across her the remembrance of Andrew's look on the evening before.

"Perhaps he really does love her," she thought. The miracle seemed less impossible since the Mary all tears and tremors was metamorphosed into a smiling Mary, almost comely in her new content.

"Oh, Drew," said Hetty, melting towards him, "if you really do love her, how ashamed I shall feel for having doubted you!"

Mary, at least, was convinced that Andrew loved her while they snatched a moment's talk in the library. He had his arm round her waist, where last night's explanation had given it a right to be.

"You have slept off all your doubts and distrusts?" he asked. "You believe in me now, Mary?"

He believed in himself at that moment.

She looked up at him with a kind of guilty shame.

"I ought never to have doubted you."

"You took a woman's word for mine, and that perhaps was natural enough. You see, possibly—just possibly—it sounds a conceited thing to say, she thought she had a right to be jealous of our friendship."

"She said she did not want you for herself," said Mary, naïvely.

Andrew bit his lip.

"Oh, her warning—I know she warned you—was no doubt purely disinterested. I can guess pretty well what she said, and how she said it. I know her—"

"You know her—well?" Even so meek a woman as Mary had her jealous pangs and fears.

"I haven't spoken to her for months; I've scarcely so much as seen her since I knew you," he said, with a significance she could not miss. "Perhaps that may account for her displeasure towards me, and yet it may be, Mary, you ought to have believed her."

"You are unkind; you hurt me when you say that."

"Oh, I'm not a saint," he said, with a fine candour. "If she said that the prospect of your having Hallett Place pleased me, she said nothing that was not true. It is a fine old place, and I should like to see you mistress of it. I am no friend to interlopers suddenly appearing, as if they were acting a novel; I like things to go in their straight course, and the right thing is that you should inherit. So you see, Miss Moss was not wrong if she attributed the baseness of a wish for your success to me."

"But I may never have that money; she ought to have remembered that. You care for me even though the chances are I should be quite poor?"

"Of course, of course," said Andrew, with less fluency; "and there is that possibility—that you may be turned out at the last moment."

"I don't think Hallett Place will ever be mine. I don't want it, unless—unless to give it to you. I have an idea that the heir will return in time. I wish he would."

"I'm afraid that most Christian wish will scarcely produce him."

"Do you know what Hetty and I call him, Andrew?"

"What do you call him?"

"We call him Frank; and we have settled that he is to be found quite at the last, like the hero of a play."

"And turn you out!"

"It would not be turning me out; it would be coming to his own."

"That contingency hasn't arrived yet," said Andrew, gaily. "If you want a melodrama of that order you must go to a more bustling stage for it: sleepy Melchisford couldn't rise to such an occasion. No, no, Mary; we shall see you enthroned, and we as your humble subjects will bow before you."

"Not you, not you!" she said, blushing painfully, for it cost her something of an effort to speak out the love she felt for him; "it is I who must look up to you."

"And meantime, Mary," he said, when he had rewarded her for this humble speech, "we must keep our secret to ourselves for a little time. Your face this morning, my dear, spoke too plainly for you."

"Why," she asked, blankly—"why a secret? Is it wrong?"

"Oh, not wrong," he answered, fluently; "but people will talk of it, and buzz it about. They will say unpleasant things—"

"About me?" She flushed and looked troubled. "Oh, Andrew, they will say I am not worthy of you!"

"No, it is not that that they will say; they will say"—he looked very melancholy—"that I am courting you for your money."

"But they can't say that, because I haven't got any."

How she harped on that string! He felt himself growing irritated over this persistence, but he controlled himself.

"Then they will say something else equally unpleasant. An engagement is the signal for all the scandal-mongers to set to work and bespatter you. Can't you imagine the tea-parties and the tittle-tattle, child—you who are a woman, and must have assisted at many such functions?"

She blanched a little, but presently she rallied.

"I have been nowhere—scarcely at a tea-party in my life," she said; "but I shouldn't mind the talk if you didn't. I shouldn't like them to say untrue things about you."

"Pooh! that's nothing," he said, as if it were indeed nothing, though a minute before it had seemed to be much. "It is the fingering of our affairs that I dislike—the discussion and re-discussion, the pawing over of our concerns, that I cannot stomach. Don't let us give ourselves as a prey to the gossips just yet; let us be as we have been awhile; it has been very pleasant, has it not?"

Of course she assented to that, but she had an unconquered doubt.

"Is it your father?" she asked, timidly. "Do you think he would object to me?"

"Scarcely, Mary, scarcely," he said, smilingly, though with a mental reservation. "But he is bothered and worried, as you can see, and he wouldn't take a proper interest in this little matter. No, we must keep our own counsel. To tell my mother or Hester would be to tell Melchisford. You women can't keep a confidence among yourselves, Mary; a secret is never safe with you till you bury it in someone else's bosom. But when a man is your confederate there is a chance for you; fear of him may keep you silent."

"I will do it for love," said Mary, very simply and honestly.

It was something of a sacrifice, for a lover is such a wonderful possession, especially to a girl who is plain and homely, and little likely to be sought. She would have liked to share this fine secret of hers with Hester and with Hester's mother, and perhaps even with Lavy Moss. For the rest of Melchisford she cared little. It was a triumph to have proved Lavy in the wrong, and something of a discipline to hold one's tongue and let Lavy go on believing that her argument had prevailed. But she would do this for him, this or anything he liked to ask—lie down and let him use her as a mat, as Mrs. Smee had said—this young man whom Mrs. Smee found commonplace and provincial and little short of odious. But then, you see, she was not in love with him.

Andrew did not in these days often seek his father's company. Mr. Hallett was scarcely pleasant society for a young man of a lively temperament; he was uncertain of mood, irritable, suspicious, as one whose conscience goads him.

What had the older man done that he should look at the other with that furtive air? Nothing—nothing at all, young Andrew would have said—nothing to pull a long face over, nothing but help himself out of a mess, which every man surely has a right to do, even if he does it at the expense of a neighbour.

On a Sunday afternoon, when Mr. Hallett was making that slow inspection of the garden and

stables which twenty-five years had crystallised into a fixed habit, Andrew sauntered up to him.

"The trees are taking very kindly to the ground," he said, as he joined his father at the new plantation; "but it will be a year or two before they make a comfortable screen." He glanced up at the house over the wall, little guessing what secret of his it had so nearly betrayed. "It would be better if you could buy the cottage."

"I should have thought even you would have felt that we have had enough to do with the bank."

"Well, I don't know; I think myself we have come out of that business very comfortably. Moss will be the one to suffer, if such a mooning idiot can be said to have any feelings. I've been wondering, by-the-bye," he went on lightly, "if you wouldn't care to rent the farm when the question of a tenant turns up?"

Mr. Hallett turned on his son sharply.

"Why should I do that?"

"It's a tidy bit of land," said Andrew, carelessly, "and in better hands it might be a good speculation."

"Moss has a big family, hasn't he?" Mr. Hallett asked, after a pause, in which perhaps he entertained a passing pity for the fallen man.

"Six girls," said Andrew, easily. "They'll have to go out to service. They want a new dairymaid at Hallett Place; what do you say to taking on the eldest? She's sharp enough."

That inward vision which had prompted this suggestion of Lavy as a servant in the household where he hoped to be master gave him a keen sense of satisfaction.

"You've settled it, I see," said his father, dryly. "That spruce is dead;" he pointed with his stick to a defaulter in the flourishing plantation.

"Shall I pull it up?" Andrew asked, understanding that he was to say no more; but while he lent himself to the task his father said, with abrupt and almost unnecessary emphasis,

"I will have nothing to do with Moss's farm or Moss's girls, and neither shall you. If you want an answer, you have it."

## CHAPTER XXII.—TOM CONFESSES HIS FAILURE.

IT was a long time before Tom was able to make any progress in the mission which he had assumed, or which perhaps we ought to say had been thrust upon him, for was it not Dot who had laid her commands upon him in the first instance? Seeing it was Dot who had urged him to the search, Tom was of course ready to go forth with the greatest alacrity. He would have attempted things a thousandfold more difficult and distasteful for her sweet sake, but even love of Dot did not enable him to choose his own time for the investigation. A young man in an office, even if he is senior clerk, cannot command a holiday when he desires to have it. If he could, cricket and football would no doubt secure many valuable allies, and the insinuating Germans, who never want holidays, would people the city. Tom therefore had to wait, and the three conspirators were doomed to suffer as best they might the frequent reports that reached them from Melchisford of Andrew Hallett's triumph. These represented him as quite secure of his prize, for even Melchisford, much as it loved a mystery, could not maintain an unchilled faith in an heir who made no sign. The hero they had hoped for was not forthcoming, and the heroine whom they had despised had to be accepted in his stead.

It was not romantic, but perhaps Melchisford had been a little too daring in expecting the age of romance to be restored for its benefit. Lost people are only found in the last volume of the three which Mudie's vans distribute over the land, and Melchisford had to be content, like the rest of the world, to satisfy its appetite for marvels at the price of two guineas a year.

When Will Somers heard these rumours he grew very red in the face, and showed other symptoms of extreme displeasure. Since Will neither envied Andrew, the lady, nor the money, his interest in the matter may seem extreme. Will himself attributed it to that love of justice and fair-play, and hatred of a mean action, which is the inheritance of every honest Briton; but perhaps the wish to please Hester Hallett was a stronger motive still. To care for a woman, even if the caring can never result in happiness, is still to hold her wishes sacred, and to secure them at a cost. Will desired the lost man's restoration for Hester's sake first, and, second, because it would be such a dear delight to see that audacious schemer, Andrew Hallett, brought low. Yes, it was worth a year's salary; yes, it was worth waiting for.

The waiting looked long, longer perhaps to Will, who had no stake in the matter, than to his friend, whose self-distrust made him unhopeful of success in his adventure. But when an autumn holiday set Tom free and gave him his opportunity, he braced himself to the business, and set forth, liberally equipped with advice and cheered by the faith that shone in one bright pair of eyes.

It was agreed when he set out that Dot and Will should meet him on his return, and his telegram summoned them to the station. It was a Wednesday night, and Will had called for his sister at the boarding-school in Bayswater, where she dragooned the daughters of gentlemen undergoing that process known as "finishing" at Miss Pendleton's establishment, and where the young governess was hovering in the passage with her bonnet on. She tripped out to meet him with a face which cleared into sunshine.

"I was so afraid I mightn't get away after all," she said; "let us go quickly, Will, in case they call me back."

"But it's your night out, Dot. You ought to make a stand for your rights. Do you suppose the parlour-maid or the cook would allow her liberty to be infringed? She would give warning on the spot."

"But a governess can't afford to stand on her dignity: that privilege is left to the ladies of the kitchen. Miss McMurdo, the parlour-boarder, wished me to go to a concert with her; and a

parlour-boarder's wishes are sacred, you know, Will. But when I told her I expected you to come for me she made up her mind to stay at home, and that was really very good-natured of her, for I was half afraid she would offer to go with us."

"Then she would have discovered that my wishes are sacred too," said Will, grimly. "See, Dot, we are safe from pursuit even if Miss McMurdo should change her mind; and it is nearly an hour till Tom's train is due. Where shall we go?"

They had made such haste that they found themselves on the confines of the City. The bustle of the day was over there, and the long grey streets were chill and deserted.

"I hear a church bell," said Dot; "there must be an evening service; let us go to it."

So they went to an old church near the terminus at which Tom would alight. It is not one of the show City churches, nor is there any illustrious dust buried under brass or stone there to attract visitors from the other side of the sea, who are the only explorers of unknown London. It stands on a little island of graveyard, long disused, which sets it on week-days apart from the tide of life that throbs round it. On Sundays the silence penetrates beyond this mouldering green waste, and fills the surrounding streets and squares; the tread of the feet, the noise of voices, all stilled, as if death reigned there too. A bell was sending out a thin monotonous note, as if it had little heart over the business, and expected few to listen to it; and, indeed, its mid-week appeal had only called together some half-dozen people, including the brother and sister, and of these three were clearly caretakers from neighbouring offices. The caretaker can always be distinguished by the discerning; her bonnet and her shawl betray her.

It was not a lively service. Dot's clear young voice was half afraid to lift itself among the quavers of her companions; when she sang even in subdued tones the others turned and looked at her: perhaps they did not often see anything so young and fresh and sweet in that mouldy place. She brought the sunshine there, and the scent of flowers, and the remembrance of country delights; and the vicar, dull and apathetic with the stagnation of his lot, wished he had thought of some words of better cheer when he saw her among his audience.

When the service was over they went out to meet Tom.

Tom was looking out for that bright face too, and when he saw it on the platform his own grew responsively cheerful. But Will, who was watching him critically as the train slowed, knew that he had nothing very important to tell. It was not with the air of a conqueror that their ambassador came back—the moment for confounding Andrew Hallett had not yet arrived.

"I haven't brought him, Dot," he said, smilingly, for her bright eyes were searching the carriage as if she half expected a stranger to alight from it, and announce himself melodramatically as the long lost heir; "and I'm afraid I haven't done much to advance his cause"

"Never mind," she said bravely, swallowing her disappointment; "I am sure you are tired, Tom, and hungry; and you want to rest and eat, don't you?"

"No, I want to tell you the little there is to tell. I had dinner before I left."

"To be sure," said Will; "here have we been waiting hours for you, and we're not going to let you off till we have extracted the last particle of news. So come along and hold forth."

"Where shall we go?"

"There is the waiting-room—"

"No, we can't talk comfortably there."

"I don't suppose they would let us into the church even if we could stand any more of its ghostliness and gloom."

"They can't prevent us sitting in the churchyard," said Tom, "and its chastened atmosphere will just suit my tale. You are not afraid, Dot?"

No, Dot was not afraid with two strong protectors, so they went to the little neglected churchyard where nobody had been laid for so long that the very ghosts must be too old and decrepit to haunt it. The gate was open, for there is a right of way across this city of the sleeping, though few people care to use it on an autumn night, when winds blow drearily with suggestions of death and the supernatural. They went in, and took possession of a stone that had fallen on its face, hiding the inscription it bore. There is nothing in the old church worth stealing, so that these three invaders were secure even from the scrutiny of a policeman. Tom spread his travelling rug on the stone for Dot, and wrapped his great-coat about her, and they all sat down to listen to his story.

"I got to my destination on Friday night," he said, "too late for anything but bed. It's a little place, and it hadn't gone mad like the places nearer town with holiday-making, and I had the choice of the inn, and was received with distinction. It's such a sleepy and un-get-at-able place that I understand now how this poor lady came to choose it. You could bury yourself there very easily even now, and be forgotten. Also how she came to appeal to my father. There was literally no one else in the same rank of life to whom she could turn unless it was the rector, and the rector of those days was, I have since found, non-resident in the village."

"That ought to have made your task much easier, since it narrows the circle."

"In one way, yes; and in another, no."

"A stranger's arrival would be an event in so small and quiet a place, and country folk have long memories for anything out of the common."

"But a quarter of a century makes a strain even on the best memory; and after all there's nothing so remarkable in the fact of a lady living quietly and poorly with her child and her servant."

"Then there was a servant? Come, that should help."

"Unfortunately it only hinders," said Tom. "I'll tell you everything in half a dozen words. In the first place, the child was not born in the village; he was, as well as I can make out, a year old or so when they came there. That was blow number one."

Dot's face fell.

"That puts things as far off as ever, doesn't it, Tom?"

"It certainly is a staggerer. But he must have been born somewhere, since it's certain he existed, and somebody cleverer than I may be able to clear the matter up. I learned one thing, though, that I did not expect—the mother died there. She is buried under the name of Alice Smith—another proof that we're on the right lines. I saw her grave."

"Dead!" said Dot and Will, in a breath.

"Yes; I don't think it ought to surprise us. In the first place, we might have gathered from that scrap of a letter that she knew herself to be beyond hope when she wrote it. It was only in the last extremity that a woman of her pride would reveal her secret to a stranger. Then if she had been living she must have seen the advertisements, and for her boy's sake she would have come forward. She wished him to be acknowledged; we have proof of that in the fact that she tried to secure one friend for him who knew his history; but her death makes the investigation a little more difficult. There was no one else who had so strong an interest in clearing up the mystery."

"What of the father?"

"I could hear nothing of him, and it is certain he was never in the village. She called herself a widow, and she probably was one. We may take it if the man was the low-born adventurer he is credited with being he would have come forward if he had been in the flesh; he would have had everything to gain by publicity."

"Then you must fall back on the servant: she is your last hope. If she went with her mistress from Hallett Place, as she seems to have done, she must be in possession of all we want to know. You've got to find her."

"And that is just where I'm pulled up short. The woman disappeared with the child immediately after the mother's death. I found one or two people who remembered her, and they had no good word for her. She was the one of the group who made the strongest impression on the village mind. The poor lady, I fancy, was broken down and saddened by ill-health and unhappiness, and was little seen, but tradition still paints this woman in black colours as a stormy and forbidding person, who ruled with a high hand. But for this and her dramatic flight with the child the whole episode would no doubt have been forgotten long ago, but a disappearance is just the sort of thing to take hold of the rural imagination, and I had several versions of the affair; one old crone even asserted that in her belief the child had been made away with, but that's improbable; it would obviously be in the nurse's interest to keep the child alive on the chance of his being owned by the grandfather."

"Then why did she make no sign?"

"Ah, if you could tell us that we should know the whole."

"Did you find nobody who could tell you where she went? Even in a village she couldn't vanish without leaving some trace."

"History is blank on the point. Probably there was no great sorrow over her departure—I can fancy there might even be rejoicing. Even the virtuous villager objects to have his charity too severely taxed, and you could scarcely expect him to run after a lady who went in for free fights and general abuse and beg her to come back again. A little of that kind of liveliness goes a long way."

"Then practically the clue ends with the mother's death?"

"It does for me. I own I'm fairly—"

"Stumped," put in Will.

"Stumped," echoed Tom. "The woman's flight was blow number two, and I confess I'm not equal to tracking her after more than a quarter of a century. It might be done, I daresay, but it would take three things I haven't got—skill and time and money. I suppose, since I've failed, the only thing to do is to hand over this bit of evidence to the Halletts and let them make what they can of it. For all I know, I may be subject to some dire penalty for not divulging it before this."

"Nothing of the kind," said Will; "there's no haste to tell. For my part, if I could produce the missing fellow to-morrow I would hold him in reserve till Andrew junior had compromised himself beyond even his ability to wriggle out of a false position; I would let the sword dangle over his head till the last moment."

"Ah, but Will, think of the girl," said Dot, pitifully: "you have forgotten poor Miss Kelynge. If he has made her care for him—"

"Care for him? Who would care for such a cad and a knave?"

"He could make her care," said Dot, with conviction.

She knew how weak the woman's heart is, how ready to surrender at a word of kindness, how eager to idealise, to create a hero out of the poorest stuff; and Mary Kelynge was made by Nature to be a victim to this kind of folly.

"Yes," said Tom, coming to Dot's rescue, "if it is a question between—"

"Unmasking the villain," put in Will, who seemed eagerly impatient to colour the talk.

"Well, put it that way, though I think it is a little too strong. Between traversing Master Andrew's plans and wounding the girl's feelings there's no doubt what ought to be done."

"Oh, you're bound to argue that way of course," said Will, with an inflection of sarcasm; "and no doubt, in the interests of justice, you're bound also to state what you know some day or other. But is it so certain that you can't carry the thing any further?"

"I'm afraid it is."

"If it's money that hinders—"

"I don't think it's money, though that would be wanted too, so much as ability. My cleverness doesn't go out in that way;" he smiled—"Nature did not cut me out for the business."

"Listen, both of you," said Dot, "I have something to propose. Hester is coming to London very soon: let us tell her what Tom has discovered; it will interest her very much. She will know if—" Dot paused hesitatingly—"she will know if her brother is going too far, and if we ought to check his hopes and prevent him from stealing poor

Mary's heart," was what she meant to say; but to her surprise Will yielded at once.

Perhaps he foresaw in those proposed confidences chances of meeting Hester, of hearing her talk, of looking into her beautiful face, which he could not otherwise secure. True, he could not take the glory of the discovery to himself—how he envied Tom that privilege!—but at least he should be present at the consultations where Hester's illuminating suggestions were sure to be of the greatest value. Dot, indeed, though she was a wise little woman, whose duty it was to instruct others, was not considered by him a very valuable counsellor; but Dot was his sister, and it was for other young men to find her a fountain of wisdom.

"Yes," he said, "let us tell Miss Hallett; you can make your formal statement to her father all the same, Tom. When does she come, Dot?"

"In a week. I know her address, and it will be easy to arrange a meeting, but we won't ask poor Hester to come and share this tombstone

THEY HAD FORGOTTEN ALL ABOUT WILL

If your news had been ever so cheerful, Tom, I think we must have found it hard to rejoice with you in so gloomy a place."

"Come, let us leave it, then."

He got up from the stone and held out a hand to her. She placed hers in it, and they went away together. They had forgotten Will, who lingered behind to light his pipe in the shelter of another tomb where the wind could not prevail. They forgot Will and the lost man too, and Tom's

mission, in which he had not distinguished himself. They were together, and for the time the desolate place of graves was another Garden where two walked alone and asked for nothing but that dual companionship. Dot forgot her fears, and the sad place was sad no longer.

"You have not told me," she said by-and-by, "but was it not hard for you to go back where—where the shadow fell on your father's life? You were going for another, to help him if you could, but you, Tom, perhaps I should not have asked you to go—"

"No," he said, "I have no memories of that time; I was too young when I left it to remember. It was all strange to me; and as Tom Rose, who was to know me for—my father's son? If it was sad, well, I had but to think of you, Dot, and the brightness came back again. My dear, we will not let that shadow rest on our lives, we will take the good with a thankful heart, and that dark memory will help us to be more generous and merciful in judging others, not knowing the strength of their temptations. That will take the bitterness out of it, Dot."

"Amen," she said, very gently. She looked up, her lips were quivering, but they smiled too; and if there were tears in her eyes, they were there for joy and pride in him.

Then Will came towards them, with Tom's bag in one hand and his rug over his arm, and they were stricken with reproach and shame, as doubtless they had reason to be; and they were so eager with apologies for having lost themselves, not to speak of Tom's baggage, that Will's hurt feelings were soothed, and he consented to accompany them to Bayswater in the omnibus.

Perhaps Will consoled himself with remembering that the trio in which he played so minor a part would presently be turned into a quartette, and four, as everybody will own, is a much more easily manageable and divisible number than three.

## A Deserted House.

WHAT a dull, common-place street,
  Houses unending,
Cloudland and chimney-stacks meet,
  Windows want mending,
Venetians all out of repair,
  Dirty and shabby,
Curtains the worse for wear,
  Maid-servants drabby!

What do I here to-night,
  With footstep that slackens,
Peering with lessening sight
  As the night blackens,
Mooning along in the dark,
  Memories hoarding?—
Here is the house! rising stark
  Gleams a white boarding.

"House to let!" empty and blank
  Stares every casement,
Musty, and fusty, and dank,
  Mice in the basement.
Sentiment covers her head,
  Shrinks in confusion:
Thought to awaken the dead?
  Bah! a delusion!

Why to the stern test of fact
  Squalid and sordid
Bring by my own foolish act
  All my past hoarded?
Let the dead bury their dead:
  Lest it affright thee,
Stir not the mould from their bed
  Who once could delight thee;

Lest the grim skull that is there,
  Ghastly and grinning,
Take the place of a face that was fair,
  Gracious and winning.
So I will leave this dead house,
  Ere I abhor it,
Leave it to beetle and mouse,
  Forget that I saw it.

HELEN SMETHAM.

# THE POETRY OF THE CENTURY:

## A RETROSPECT AND ANTICIPATION.

THERE are few things more remarkable in the history of our literature than the splendour of song which brightened the early years of this century. The last age, indeed, was not without its poets; but for the most part these poets were not singers, and lacked the noble imagination and wealth of melody that distinguished an earlier and a later period. Pope's consummate gift as a satirist, his skill as an artificer in verse, and the dainty fancy that produced a "Rape of the Lock," place him at the head of the second order of poets, unless, indeed, Dryden may claim precedence. The time is passed, it may be hoped, for a critic of poetry to write disparagingly of Pope, but that is no reason for ignoring the limitations of his genius. It may be true, as Mr. Ruskin says, that we have nothing else in its range so perfect; but into the highest regions of song Pope cannot soar. The note of inspiration is lacking—the note, I mean, that is to be found in almost every page of Spenser, of Milton, and of many of the minor Elizabethan poets. In this respect Thomson comes nearer to them than Pope; there are flashes of "the light that never was on sea or land" in Collins and Gray, mixed with much that is conventional, but it was not until the later years of the century that we see indications of a revivifying power in the poems of Cowper and of Burns.

With the new age arose a fresh spring-time of poetry, to be followed by a lovely summer. It was as though every bud was bursting into blossom, every bird into song, every flower in meadow and wood opening its eyes in the sunshine. Wordsworth writes of Burns as having "walked in glory and in joy, following his plough along the mountain-side," and it was the same gladness of song that distinguished Wordsworth himself, the greatest poet of our century. He was not understood at first—a great imaginative thinker seldom is; and it must be admitted that his own perversity, combined with a want of humour well-nigh portentous, considerably delayed his fame. But as in 1798 he had published the "Lines" written above Tintern Abbey, and, in 1800, "Michael," "The Old Cumberland Beggar," "The Two April Mornings," "The Fountain," "Three years she grew in sun and shower," and some other poems almost equally characteristic of his genius, he had done enough by the very earliest days of the century to show that those days had brought with them one of the rarest of gifts—a poet of the highest originality. Wordsworth, as his great successor has truly said, "uttered nothing base," but unfortunately he wrote a good deal when he had not his singing robes on. He can be prosaic, he can be dull, and yet even at his lowest level, when, as Sir Walter Scott said, he "crept upon all fours," there is something in his bearing that is not commonplace.

In the brooding thoughts born of imagination Wordsworth is the profoundest poet since Shakespeare; in the music of song he is surpassed by his friend Coleridge, with whom he began his poetical career in 1798. It is strange to think, by the way, that the first volume of the "Lyrical Ballads" might have been read by Cowper. Like Wordsworth, Coleridge is one of the chief poetical glories of the age, chiefly because he had an ear for harmony which, except by Milton, has never been surpassed. His lines are music, and like a lovely strain of music we cannot listen to them too often, and never feel inclined to say with Shakespeare's Orsino:

> "Enough; no more.
> 'Tis not so sweet now as it was before.

In 1805 Walter Scott, who had made some tentative efforts previously, may be said to have begun his poetical career with the "Lay of the Last Minstrel." Its success was enormous. Like Byron a little later, he leapt into fame at a bound, and was accounted the most popular poet of the time. "Marmion" and "The Lady of the Lake" sent his reputation up still higher; and it was not ill-deserved. We must judge of a poet by the qualities he has, and not by those in which he is lacking. Scott saw things vividly, and painted them with a simplicity and force unsurpassed in modern literature. His verse lays hold of the memory; and while careless about felicities of expression, the rapid strokes with which he draws his scenes are masterly and precise. The greatest of all story-tellers in prose, he knows also how to tell a tale in verse, where the fiction should be subordinate to the poetical emotion. The manliness of Scott's poetry is, I think, a feature especially attractive in this day, when among our minor versemen every curious subtlety of expression is preferred to directness. And no poet since the days of Homer has described battle-scenes with such power. In his sentiment he is sometimes a little commonplace; in scenes that require vigorous action, never. And what a wholesome writer he is! The breezes of the mountains are not more invigorating.

Far otherwise was the poetry of Lord Byron, who followed closely upon Scott in the publication of his poems, and who, with the modesty natural to him, Scott considerably overrated. For a time his poetry created a fever of admiration, and while Wordsworth was not receiving money enough for his verse to pay, as he said, for shoe-leather, Byron gained thousands of pounds for meretricious work that has long since ceased to be admired.

Not that Byron's entire work was of that character. Had it been so he would never have brought some of the largest of modern intellects under his spell. But his most striking literary qualities were not distinctly poetical. His wit and satire are more conspicuous than his imagination, and these gifts are unfortunately exhibited in poems which display at the same time whatever in his character was basest and most depraved.

The impression made by Lord Byron on the mind of the English people was extraordinary.

> "He taught us little; but our soul
> Had *felt* him like the thunder's roll,"

is the poetical expression of what thousands felt when the report of his death reached England. "Poor Byron! Alas, poor Byron!" Carlyle wrote; "the news of his death came upon my heart like a mass of lead." And his future wife wrote: "If they had said the sun or the moon was gone out of the heavens it could not have struck me with the idea of a more awful and dreary blank in the creation than the words, 'Byron is dead!'"

In these later years his power has lessened in as great a degree perhaps as that of Wordsworth has increased; and a living poet who has earned ample laurels as a critic of poetry does not scruple to place Byron, save for the qualities we have mentioned, in the third order of poets. At the same time he extols Shelley, whose melancholy and most painful story shall not be touched on here. For music, it may be admitted, Shelley's chief modern rival is Coleridge, but the heart and intellect claim to be satisfied as well as the ear, and to these the poetry of Shelley does not greatly minister. Neither, indeed, does that of Keats, who has written poems unsurpassed for richness of imagery and enchanting felicity of expression. He seems to have had every poetical gift with the exception of spiritual insight, and that might have come with the "years that bring the philosophic mind." There was fulfilment in Keats as well as promise, and no reader of his poetry should forget that he died at the early age of twenty-six.

This slight sketch of the poets who have for ever made memorable the first thirty or forty years of the century will at least serve, superficial though it be, to remind the reader how for forty years longer the continuity of poetic fame has been preserved. Keats died in 1821, Lord Tennyson's earliest poems appeared in 1827, and from that day to the present (for "Rizpah" and "Crossing the Bar" are worthy of the Laureate in his prime) this delightful poet has proved his right to a royal place in the "realms of gold."

To attempt to criticise Tennyson's work in this rapid glance over a wide field of poetry would be an impertinence, neither is it needful to do more than refer to his noble rival and friend who has so recently been buried in the resting-place of England's poets. But it may at least be pointed out in passing that the two greatest poets since Wordsworth died in 1850 are alike distinguished for reverence, for purity, for a lofty ideal, for a chivalric estimate, which is ever the true estimate, of woman, and for a sincerity of purpose without which no work of lasting value has ever been achieved. They have never, like too many of our poets,

> "Profaned the God-given strength, and marred the lofty line."

In this respect, too, the highest praise is due to several living poets, who, although less distinguished than the two giants we have mentioned, have an honoured place among the singers of the age. Mr. Coventry Patmore, whose theme throughout his most popular verse is Love, writes of it with manly ardour and at the same time with virginal purity. There is not a line in his "Angel in the House" that has a taint of earthiness, and Mr. Aubrey de Vere's high-souled Muse may find fit companionship with that of Keble himself.

Miss Jean Ingelow, like her illustrious predecessor Elizabeth Barrett Browning, is a Christian poet of a noble type, whose voice of song is at once sweet and inspiring. The life and freshness of her verse caught the ear of the public at once, and though her work is sometimes a little careless and diffuse, the author of "The High Tide on the Coast of Lincolnshire" deserves her fame. Equal to her in popularity, but unlike in other respects, is Mr. Lewis Morris, who won the reputation he has gained chiefly by the "Epic of Hades," a poem that has the merit of originality both in subject and treatment. The wide circulation of this Epic proves that the general reader can appreciate poetry which happens to fall in with his taste. The poet's later works have been almost equally successful, and of recent days he has shown his versatility as a writer of official odes. Something, too, might be said here, if this paper were an elaborate essay and not a sketch, in praise of some living and some recently deceased poets; of Allingham and Mrs. Pfeiffer; of Mackay and Miss Rossetti; of H. S. Sutton and Professor Shairp, of Inchbold, better known as an exquisite landscape painter; of George Macdonald, and of William Barnes, the Dorsetshire poet. There is, however, but space for the remark that the verse of these singers—and genuine singers they are—is immeasurably superior to the verse produced by the minor poets of the last century. It is more elevated in tone, more musical, more imaginative, and, in a word, more poetical.

It is something to live in an age when poets such as these are our friends and teachers; and looking across the sea our obligation is enlarged when we remember what Longfellow and Bryant, Mr. Whittier and Mr. Lowell, have done for us.

> "Blessings be with them, and eternal praise,
> Who gave us nobler loves and nobler cares—
> The Poets, who on earth have made us heirs
> Of truth and pure delight by heavenly lays!"

And now in this last decade of the century the question naturally arises—which was indeed recently asked in these columns—What is likely to be the future of English poetry? Has the race of giants died out? and are we threatened with the "scrannel-pipes" of pigmies? Looking back upon the past—and it is only through what we

know of the past that we are able to prophesy, however timidly, of the future—we find that poetry, the finest of the Arts, is also the rarest, and that there has been many a barren period in which the voice of song was feeble or altogether mute. Versemen there may have been, but they are sorry substitutes for poets. Chaucer—the father of English poetry, as Dryden called him—died in 1400, and if it cannot be truly said that he left no poetical children, yet, although interesting to students, they have no permanent standing in the line of poets; and it was not until the advent of Spenser, who was born about 1552, that Chaucer had a successor and an equal. During the greater portion, then, of two centuries our British world lacked a poet worthy of being called a classic. A period followed in which the whole air, so to speak, was full of song. Even the minor Elizabethan poets—as Mr. Bullen has proved by his anthology entitled "Lyrics from Elizabethan Song-books"—had a lovely note of their own which distinguished them from mocking-birds. Indeed, each of these mellifluous lyrists might have said, in the words of Tennyson,

> "I do but sing because I must,
> And pipe but as the linnets sing."

In a poetical sense, Milton may be described as the last of the Elizabethans. He clasps hands with Chaucer, Shakespeare, and Spenser, but who was there when Milton died worthy to carry on the poetical succession? Dryden and Pope are great names, but they belong, as I have said, to a lower order of greatness, and their imitators, the minor versifiers of the age, mistook the art of stringing couplets for poetry. It is significant of the absence of poetic life through long periods of the eighteenth century that it numbered among its Laureates such insignificant versifiers as Nahum Tate, Eusden, Colley Cibber, Whitehead, and Pye.

It is possible, then, that the joyous spring, the brilliant summer, and golden autumn of poetry which have given such glory to our age may be followed by a winter in which natural growth under the eye of Heaven will be suspended and the tender flowers of song raised by artificial heat. In other words, and to drop metaphor, the verse of the coming years may owe more to Art than Nature. "After a certain period," said Warton, "in every age and in every country, men grow weary of the natural and search after the singular." This was the case with Donne and Cowley in the seventeenth century. Both were poets of rare genius, who have marred their fame by eccentricities and conceits, and their extravagances misled several smaller poets, who outbid them in fantastic turns of expression. Readers who by accident or vocation have gained a considerable acquaintance with the minor poets of our day, whose volumes are as numerous (would that they were also as beautiful!) as spring flowers, may have frequently noticed a straining after effect and an endeavour to conceal the commonplace by verbal subtleties and by the adoption of metres alien to the genius of the language. "Never," says an able critic, "were there so many capable of polishing measures quite unexceptionable as to form and structure; never fewer whose efforts have lifted them above what is, to be sure, an unprecedented level, but still a level."

No doubt the verse that is due to culture and not to genius has its momentary attractions. Ingenuity and knowledge may produce something agreeable in form, and with even the semblance of life, but if the vital principle—creative imagination—be wanting, the popularity of the hour will not save it from corruption.

At the same time it is well to remember that it is not always poetry of the highest order which satisfies the heart most fully. Some of the lines we recall with the greatest delight are due to singers whose place in the Temple of Fame is comparatively obscure. They came from the heart of the writers probably in some hour of strong emotion, and the warm life with which they glow thrills the heart of the reader also. And there are times when these "simple and heartfelt lays" give us more pleasure than the finest efforts of genius, just as there are times when a voice like that of Wordsworth's Highland Reaper, singing perhaps of

> "—old unhappy far-off things,
> And battles long ago,"

is a sweeter sound to us than the voice of the most accomplished singer. Indeed, we have only to open any popular selection of verse to see how many of the poems most dear and most familiar come from the pen of writers who, judging critically, do not perhaps merit the high name of poets.

It is as unnecessary as it would be impertinent to pass an offhand judgment on the claims of any conspicuous living versifier to a place in the brotherhood of poets, but this at least may be maintained without presumption, that the poetical imagination seeks its choicest food in faith and hope, and that when these are lacking poetry must decline.

That, we mean to say, is the *tendency* of all poetry which has its source in doubt, though there have been, and may be in the future, poets who, like Clough and Matthew Arnold, find in vagueness and uncertainty a stimulus to the imagination. The most illustrious example, not indeed of the doubt and obstinate questionings that beset all thinking men in pagan Rome, but of absolute denial, is Lucretius,

> "Who dropped his plummet down the broad
> Deep universe, and said 'No God.'
>
> Finding no bottom: he denied
> Divinity the divine and died
> Chief poet on the Tiber side."

These, however, are exceptions, and the rule holds good that joy is the element in which a poet lives, while pessimism is for the most part the grave of noble verse. With what voice will he sing who holds "this goodly frame the earth"

to be a "sterile promontory," and "this brave o'erhanging firmament, this majestical roof fretted with golden fire, no other thing than a foul and pestilent congregation of vapours"? For to the man who has lost his faith in God and immortality Nature herself is no longer a temple of beauty, but

> "The spheres eternal are a grand illusion;
> The empyrean is a void abyss."

These are the words of James Thomson—not the poet of "The Seasons," but the author of "The City of the Dreadful Night"—who died but recently, and dedicates his mournful verse to Leopardi, the poetical high priest of pessimism. It seems strange that a man who regards our human lot as one of unmitigated sorrow, and the sleep of annihilation as the sole escape from it, should take the trouble to set his woes to song. Dust and ashes hardly call for music! Thomson has at least the merit of sincerity, and the words he puts into the mouth of a preacher in a cathedral pulpit in his dark city of despair express his own creed:

> "This little life is all we must endure,
> The grave's most holy peace is ever sure.
> We fall asleep and never wake again;
> Nothing is of us but the mouldering flesh,
> Whose elements dissolve and merge afresh
> In earth, air, water, plants, and other men.
>
> We finish thus; and all our wretched race
> Shall finish with its cycle, and give place
> To other beings, with their own time-doom.
> Infinite æons ere our kind began;
> Infinite æons after the last man
> Has joined the mammoth in earth's tomb and womb.
>
> * * * *
>
> O Brothers of sad lives! they are so brief;
> A few short years must bring us all relief.
> Can we not bear these years of labouring breath?
> But if you would not this poor life fulfil,
> Lo! you are free to end it when you will,
> Without the fear of waking after death."

This is the preacher's gospel, in which, in "tones sad and tender as a requiem lay," he bids the people rejoice, and professes to find comfort himself:

> "My Brother, my poor Brothers, it is thus;
> This life itself holds nothing good for us,
> But it ends soon, and never more can be;
> And we knew nothing of it ere our birth,
> And shall know nothing when consigned to earth;
> I ponder these thoughts, and they comfort me."

Some minor poets of the day with less force than Thomson appear to take a ghastly pleasure in hugging their despair. One of them with a rare lyrical gift, whose sweetness of touch led to the hope of something higher and better in the future, will be sadly remembered even by those who knew her only through her verses, as having recently died a mournful death. In the little volume published after her death this is the sad strain in which Miss Amy Levy writes:

> "Our hopes go down that sailed before the breeze;
> Our creeds upon the rocks are rent in twain;
> Something it is if at the last remain
> One floating spar cast up by hungry seas.
>
> The secret of our being who can tell?
> To praise the gods and Fate is not my part;
> Evil I see, and pain; within my heart
> There is no voice that whispers, 'All is well.'"

The poetry of despair, or even of indifference, will not, we may trust, be the poetry of the future in the England of Milton and of Wordsworth, of Tennyson and of Browning, but it is sufficiently exemplified by the smaller poets of our day to call for comment and regret. Happily there are poets whose estimate of the meaning and worth of life has been unaffected by the pessimist and the Comtist—poets who, whether their distinction be great or small, are at one in their belief in the government of the world by a Being perfect in holiness and in love.

One significant trait in the poetry of our time remains to be mentioned. I allude to the art of writing verses of society. Never since the days of Prior has such graceful poetry of this class been written, and from Thackeray to Mr. Dobson we have had quite a nest of singing birds chirping in this winning style. One does not appreciate these efforts too highly in saying that they are welcome at all times, and most welcome in that after-dinner mood that does not crave for verse of a loftier kind.

Now, I can imagine that some readers who have no special love of poetry, and "like it next to prose," may ask why so much stress has been laid on the tendencies of modern verse. In their eyes poetry may appear a feigned thing, fit indeed for the amusement of an idle hour, but of no great account in the spiritual and intellectual progress of the country. "It is indeed a serious matter," they may say, "when books weighty with thought or facts have a sceptical tendency; but is it not altogether a false estimate of poetry to place it on a level with works of philosophy and science?" On the contrary, its influence on the intellect and heart cannot be estimated too highly. Poetry appeals to the emotions, to the imagination, to the ear; it moves our strongest feelings, and sways us we know not how. It is the highest form of expression, the most enduring form of which language is capable; and poets have been not inaptly called the unacknowledged legislators of mankind. In the early and most sensitive period of life they are among the principal, because the best beloved, teachers; and Wordsworth does not overrate their power when he exclaims in lines glowing with the love of country:

> "We must be free or die, who speak the tongue
> That Shakespeare spake; the faith and morals hold
> Which Milton held. In everything we are sprung
> Of earth's first blood—have titles manifold."

Mr. Matthew Arnold, it must be admitted, by his extravagant praise of poetry has done as much as the weight of his authority is worth to depreciate its value. It is not true, nothing indeed can be more untrue than his assertion that as the facts on which Christianity is based are failing us, we shall find an ever surer and surer stay in poetry. We need a firmer ground for our faith than ideas, and we might as well expect to find in poetry the future religion of the world as to find in Mr. Arnold's "stream of tendency that makes for righteousness" a substitute for the Christ of the New Testament. Milton understood better than Mr. Arnold the real service rendered by poetry, which is designed "to imbreed and cherish in a great nation the seeds of virtue and civility." This is what the noblest verse of the past has done, and this is what one hopes for in the poetry of the future. It is, therefore, of no small moment to observe the poetical tendencies of our day as represented by its youthful poets, as well as by the more mature successors of Lord Tennyson and Browning. The outlook is not, I think, cheerful. Mr. Swinburne's finest work, "Atalanta in Calydon," was published about a quarter of a century ago; and though he has written much since, remarkable for a marvellous flow of language and command of metre, and not a little that had better have been left unwritten, he can scarcely be said to have risen to a higher level than he reached so decisively in 1864. Mr. Buchanan, too, has written much in many forms since a well-known critic drew attention to his early poems a year later; but despite greater efforts, his early lyrics are still the poems we remember most gratefully in recalling the poetical labours of this versatile writer. Mr. Alfred Austin, who started as a satirist, has grown into a poet, who, when he sits under his trees and listens to the thrushes, has a voice almost as sweet as theirs. He is too ambitious, however, not to plan and execute poems on a large scale, in which it is not always possible to follow him either as a poet or a moralist. Mr. William Morris, the "idle singer of an idle lay," has been somewhat rashly compared to Chaucer; but he is a poet of an original and fine order, whose poetical ardour in years gone by would seem to have been as great as his political ardour is now. He, too, did his loveliest work as a singer in the sixties, and is not one of the poets who has had to wait for his fame. No reader of the "Life and Death of Jason," published in 1867, could doubt that he was in the presence of a true and of a sweet poet, and the "Earthly Paradise" will have confirmed the impression.

Poetry, however, is an exacting mistress, and demands before greatness can be achieved the devotion of a life. These are the poets of a younger generation who stand below Tennyson—how much below it is not for the present writer to say—and it is possible that when our revered Laureate "crosses the bar" (long may it be yet!) to one of these poets the wreath may be awarded. Who can say? Genius of the poetical order steals into the world with no sound of trumpet or public acclamation; and there may be living now some nearly-fledged poet whose power, at present hidden from the world, will make itself acknowledged. Even then, however, the claims of older men are not likely to be put aside in favour of a stripling, even though he may be a David, and can slay a giant with a sling and a stone.

JOHN DENNIS

# THE SOVEREIGNS OF EUROPE.

## THE REIGNING FAMILY OF PORTUGAL.

THE KING OF PORTUGAL.

[*From a Photograph by A. Bobone*

IN Portuguese annals the date of December 1st, 1640, is known as that of "the glorious revolution against the Spanish usurper," a revolution which placed upon the throne of Portugal that Duke of Braganza who ascended it under the name of Dom Joao IV.

For sixty long years had the country groaned under its Spanish masters. It was a period of humiliation deep and galling, following as it did upon the catastrophe on African soil that lost to the land its autonomy.

Little wonder, therefore, that when the favourable moment came to reassert themselves the people turned as with one accord to the Princes of the house of Braganza as their saviours. This noble family is one of the oldest and most powerful in Europe, of vast wealth and great merit. Probably no country can show such another house privileged at all times to take almost royal rank. The Kings of Spain had long watched these dukes with anxiety, in view of their great and unusual privileges, feeling dimly that they were too important and powerful to remain vassals for ever. It was quite natural that the Portuguese should turn to their family for deliverance from the heavy Spanish yoke.

The history of this revolution that ended the Spanish dominion in Portugal is romantic. A given day and hour had been secretly appointed for action. It was a cold winter's morning when one by one the actors in the conspiracy gathered together silently outside the palace, where no suspicion of their design was harboured.

At nine precisely the assembled nobles entered the gates of the viceregal abode, felled the guards, and, carrying all opposition before them, slew the Prime Minister of the Duchess of Mantua, then Spanish Regent.

"Liberty, liberty!" shouted one of the noble conspirators from the palace balcony to the assembled people below. "Liberty! Long live Dom Joao IV! The Duke of Braganza is our legitimate king!"

And the crowd echoed the cry of "Liberty!" from thousands of throats. Like lightning the insurrectionary movement spread throughout the provinces; there was no hesitation on the part of the people, no resistance worth naming on the

part of the enemy. The Spanish dominion that seemed so firmly rooted vanished as though touched by an enchanter's wand, and the down-trodden Portuguese uprose again firm and intrepid as in their palmiest days.

From that time forward December 1st is celebrated in Portugal with enthusiasm, and from that date the Braganzas have held its sovereignty.

The late King, Dom Luis I, ascended its throne in 1861, in consequence of the untimely death of his brother, Dom Pedro V. The history of this accession is a tragedy. Dom Pedro was the eldest son of that Queen Maria da Gloria who became sovereign as a mere child, and whose helplessness and charms moved the pity of all Europe. He himself was but eighteen when called on to rule, but he won his subjects' love at once by his grave demeanour and solicitude for their welfare—a love that culminated in very worship after he had shown heroic virtues and rare abnegation in moments of national danger, yellow fever succeeding cholera in decimating the land shortly after he had come into power. Wherever the epidemics raged most there was seen the youthful form of the King, and no persuasion could keep him away.

"My post," he used to say, "is where the hand of sickness weighs heaviest, and where the sickle of death mows the flower of my people. My place is close to the suffering and the sorrowful; it is for this that I am king."

The city of Lisbon, considering that the King had in those sad days proved himself its greatest citizen, unanimously voted him a medal, and the Humanitarian Society of Oporto likewise conferred on him one of the decorations it grants but to the highest of all merits. These two insignia were ever of all his orders those most prized by the King, for he had won them by his own deeds.

In 1856 the young King married the youthful Princess Stéphanie of Hohenzollern-Sigmaringen. A year later, after a few days' illness, she was laid in her grave. The nation grieved with its sovereign, whose sorrow was deep and heartfelt. Touching are the words in which he thanked them for their sympathy.

"During the four years of my reign," he wrote, "my people and I have been companions in misfortune. My conscience tells me that I never abandoned them in their trials. To-day, when I myself need comfort, they in their turn do not abandon me. I find my consolation in my religion, which bids me believe and hope, and in my people's tears as they mingle with mine."

The image of this lost wife was never effaced from Dom Pedro's memory, and his grief no doubt helped to sap his strength, which was still further taxed when, in 1861, he insisted upon making a tour through all his provinces, visiting all the unhealthy districts that he might judge of their needs with his own eyes. When he returned to Lisbon in the autumn, fatigued and enervated, he found his brothers Fernando and Augusto stricken with malignant fever. Nothing could keep him from their bedsides. The tragedy that followed is familiar to all: the elder prince died, the second was long at death's door, and survived almost by a miracle, and had not yet turned the corner of recovery when the King, low in body and mind, also caught the infection, and expired within four days. The grief of the land was sincere and poignant. It is said by those who witnessed it that never was seen such a sight as that in Lisbon the night the monarch lay dying. Rich and poor flocked into the churches and prayed earnestly to God to preserve the valued life of him who was to them father and brother. The bells tolled without ceasing. Everyone was unnerved; the only calm spirit in the midst of this consternation was the King's. He rejoiced that for him the hour of liberation from the trammels of the flesh had struck.

Scarcely had he passed away when his remaining brothers, Luis and Joao, arrived in Lisbon, hastily summoned thither by the dire news of the royal sickness. At once Dom Joao also caught the infection, and despite of care he too expired. The people now rose up in tumult, thinking that malevolence had been at work. And it took long to calm them and to prove that the malignant spirits were none other than bad drainage and unwholesome conditions.

It was amid such gloom that the late departed ruler became King of Portugal and the Algarves. Born in 1838, he had received the same careful education as his brothers, and early gave signs of the love of study that distinguished him. A year after his accession he married Maria Pia, second daughter of King Victor Emmanuel of Italy, who at the time of her marriage was but fifteen years old. The union proved a happy one, and the course of their life was tranquil. The King, though he did not gain the worship of his people like his royal brother, was yet well beloved, and they were satisfied with his reign, during whose course Portugal had seen many internal changes—changes in the direction of modern progress that have perchance been pressed upon it even a little too rapidly for its comprehension and absorption, and which of late show threatening signs of the inevitable reaction induced by a too violent mutation of conditions. A student by nature, the health of the King in his later years precluded him from taking a very active part in public affairs; but the Government, which is representative (Cortes), like all Parliaments marched of itself without his intervention. What he loved best were literary and artistic pursuits. He was fond, too, of the society of artists, who were congenial to his naturally gay temperament. Though he has written nothing original, he spent much time over literary work, and translated—and very well too—various foreign authors, his best work being translations of the "Merchant of Venice," "Othello," and "Hamlet." In personal appearance he rather resembled some jolly Dutch sea-captain. His manners were unaffected and easy, his tastes advanced and simple, and he did all he could to counteract the rigid Spanish etiquette that did not harmonise with his own liberal ideas.

Very popular was the Queen, who had secured the affections of a people singularly warm-hearted and attached to its royal house. In person she is

tall, elegant of bearing, with a mixture of reserve, grace of manner, and *bonhomie* that recalls her hunter father. Nor does she fail to resemble him in other respects. Like Victor Emmanuel, Queen Maria Pia was a passionate votary of shooting and all kinds of sport, a taste in which the King concurred. Unable, however, to gratify it always to its full extent, the Queen, when in *villeggiatura* at the watering-place of Caldas, used to amuse herself with the harmless practice of aiming with a rifle out of a high window at earthenware bottles floating in the sea, and placed there for that purpose. It is said that it was not often that she missed her unstable mark.

But for all these mannish tasks she was a queen and a woman. She dressed with taste and elegance, her jewels were among the most costly of any regent's, and her household was ruled with an etiquette that proved that she never forgot her rank, even if it pleased her at times to disguise it. This she does most frequently when bound upon some of those errands of mercy for which she is famed, and which have gained her the name of "Angel of Charity." Philanthropy is with her as much a passion as hunting, music, or painting. She is at the head of all Portuguese charitable establishments, which she directs in person, even to the minutest details. Always to the fore if any disaster occurred, any appeals were made to the public purse, she did not confine her charitable exertions to public calamities only. Endless are the anecdotes told of her good deeds. Many and many a time has she quitted the palace at some early morning hour, unaccompanied, simply dressed in black; and none of the household dare ask whither went her Majesty, for all knew she was bound on some secret errand of mercy. Once when a civic guard, recognising her and seeing her enter one of the lowest quarters of Lisbon, followed her to watch over her safety, she sternly forbade him to divulge what he had seen, or to unmask her anonymity. In all cases of distress brought under her notice she desires, if possible, to judge for herself, and behold with her own eyes.

It was no uncommon sight to see her on quitting the cathedral after morning mass surrounded by a crowd of poor people, who knelt as she passed, kissed the hem of her dress, or presented her some petition. These she invariably took in her own hand and read on her return home.

The life led by the late King and his Queen was, like that of most royal personages, highly methodical. The Queen rose early, and breakfasted on a simple cup of chocolate at seven, after which she at once set to work, directing her correspondence, reading some of the newest publications, or attending to her philanthropic institutions. At midday was the general lunch, which was partaken of in company with the King and royal household. At two o'clock when in Lisbon the Queen received at the Palace of Azuda, when she showed herself most accessible, and was ever ready to converse with her visitors, especially on charitable or artistic themes. At four o'clock she went out driving either in the town or the lovely environs of Lisbon. Most often she visited Mafra, which may be called the Versailles of Lisbon. Here she was able to gratify some of her sportswoman tastes—shooting, rowing, or driving four-in-hand. By eight o'clock she was back in the palace for dinner, after which she frequently went to the theatre. The Queen-Dowager plays the piano and sings with taste, and her water-colour paintings are graceful. Quite recently she painted a charming fan for the Queen of Italy representing the pier at Lisbon and the tower of Belem. She is passionately fond of flowers, especially of maiden-hair ferns and lilies of the valley, of which basketfuls always adorn her private apartments. The King, too, loved flowers; and the grounds about the Palace of Azuda resemble a botanical garden more than a private one. But better than flowers he loved birds, and his aviaries were stocked with native and foreign specimens, which were his pets and his delight. The Queen, less retiring by nature than the King, loved society even more than great receptions. She encouraged *petits comités*, when music, informal dancing, and talk formed the entertainments of the evening. She directed these little *réunions* with the tact and skill of a good hostess and a *grande dame*. Unlike most royal receptions, those held under her auspices were not dull. After the King's health declined so seriously it was the Queen who tended him, and who proved herself the best assistant to the doctors. In a word, she is in all respects a superior woman. The recollections that abide with her in these days of her sorrow must be fragrant still.

Two sons are the fruit of this royal union. The eldest, Dom Carlos, Duke of Braganza, now King of Portugal, was born in 1863. He, too, like his maternal grandfather, is a mighty hunter. Until called to the throne most of his time was spent at Villa Vicosa, the ancient residence of the Dukes of Braganza, whose vast adjoining estates permitted him to gratify to the full his love of sport. It is said of him that he is good and kind-hearted, but by no means clever, nor distinguished for any salient traits. No anecdotes about him circulate in society or among the people. He remains as yet for them rather an unknown quantity. Time alone can show what manner of ruler he will make. In 1886 he married the Princess Amélie, eldest daughter of the Comte de Paris. The reception accorded to the bride on her public entry into Lisbon was something equally touching and imposing. All the splendour of the ancient days when Portugal took high rank among nations, glorious in her brave discoverers and learned men, seemed revived for the nonce in the magnificent processions that filed through the streets, gorgeous pageants whose picturesqueness was enhanced by the beauty of the town of Lisbon itself—that masterpiece of the great Minister of Joao I, the Marquis of Pombal, who caused it to uprise more lovely than ever from the ruins occasioned by the great earthquake of 1755, that laid it low. Like Rome, this city too is built on seven hills, and its beauty has been the theme of poets and painters. A quaint German legend tells how a certain knight of Jerusalem desired to behold in a magic mirror the most beautiful city of Europe. At his desire there uprose before his gaze, in all its beauty, Lisbon the Great, as it was called in

those days. And even now, though no longer the emporium of Eastern trade, no longer the wealthy busy centre, Lisbon still retains her natural charms.

To Lisbon the Orleans Princess was tenderly welcomed, and it is pleasant to know that she has fulfilled the fond expectations her advent awoke in Portuguese breasts. Her young daughter-in-law is also a special favourite with the Dowager Queen. Indeed, the Portuguese royal family are very united and affectionate.

Before the young couple had ended their honeymoon the Duke of Braganza was called upon to serve his apprenticeship as ruler during the temporary absence of his father, who had left for reasons of health. He acquitted himself of his task in such a manner that the Portuguese were well satisfied, and trust that, now Dom Carlos is called upon to succeed his sire, his government will be one of peace and sound administration. An heir is also already provided for. The rejoicings throughout the land at the birth of this first child were great, the late King giving in its honour a series of State banquets, on which occasion there figured on the table that far-famed service of plate, well known to amateurs, which is of such rare workmanship and of such costly material that it is seldom removed from the strong rooms in which it is safeguarded. A magnificent pageant, too, was the formal coronation of the new King on December 28 of last year, though for the King and Queen the pleasure of the ceremony must have been considerably marred by the fact that both were suffering from a severe attack of the influenza epidemic that has raged throughout Europe.

Such this royal family of Portugal, of whom the Queen-Dowager is certainly the most picturesque and prominent member; good, kind, homely persons, who, as far as their personal characters are concerned, will never disturb the peace of Europe, but who, all of them, strive to do their duty in that exalted station of life to which they have been called.

## At the Prison Gate.

Once by a foreign prison gate,
  Deep in the gloom of frowning stone,
I saw a woman, desolate,
    Sitting alone;
Immeasurable pain enwound,
Infinite anguish lapped her round
As the sea laps some sunken shore
Where flowers will blossom never more.

Despair sat shrined in her dry eyes—
  Her heart, I thought, in blood must weep,
For hopes that never more can rise
    From their death-sleep;
And round her hovered phantoms grey—
Ghosts of delight dead many a day;
And all the thorns of life seemed wed
In one sharp crown about her head.

And all the poor world's aching heart
  Beat there, I thought, and could not break.
Oh! to be strong to bear the smart—
    The vast heart-ache!
Then through my soul a clear light shone;
What I would do, my Lord has done;
He bore the whole world's crown of thorn—
For her sake, too, that crown was worn!

E. NESBIT.

AT THE PRISON GATE.

## ABOUT PRIMROSES.

IF there is one subject more than another in which guessing is very often easy, and nearly always fatal, it is, perhaps, that which treats of the origin and derivation of words. But, admitting that what seems obvious is often most inaccurate and untrue, is there any doubt but that the "primrose" really means the "first rose," or "first flower" of the year? At the first glance the origin and meaning of the word seem quite clear and unmistakable; yet this very easy derivation is not the right one, as may be seen by considering the way in which the word used to be spelt. In old herbals the word is written "pryme-rolle," and Chaucer's form of it is "primerole." This is the same as the old French "primeverole," and the Italian "primaverola," a diminutive formed from the two parts, "prima" and "vera"—"first" and "spring." So that, after all, the original meaning of the word primrose seems to be the first flower of spring.

In the south of Europe this name is given to the daisy, for the primrose is seldom found. The Germans call it by quite a different name. To them it is the "himmel-schlussel," the "key of heaven;" or simply the "schlussel-blume," the "key-flower." The latter name seems properly to belong to the cowslip, and may be a reference to the likeness which its hanging blossoms bear to a bunch of keys.

But there is a fuller meaning in the name than this. It seems to have the reputation—enjoyed also by several other plants—of opening the doors which bar the way to great treasures hidden by unknown hands.

There are many such legends of opening plants. Thus we are told that in Iceland there is a belief that the curious and rather local plant herb-paris is capable of opening any lock, and it is called "lasa grass," the plant which "looses," or unlocks. The striking appearance of herb-paris—the four great leaves surrounding a solitary and very peculiar flower—was probably considered sufficient reason for attributing to it some extraordinary power.

Again, in the swampy meadows of Russia grows the "rasivtrava" ("rasiv" signifying to open, and "trava" a herb), by means of which housebreakers are supposed to effect an easy entrance into any house they please.

There are other plants which are said to be used by birds for making their way to a nest which has been built up, or in some way hidden; and there are on record remarkable tales which are quoted in proof of this statement.

But we need not travel so far as Russia or Iceland to find strange and amusing ideas about flowers—even primroses. In Devonshire it is considered unlucky to carry a solitary primrose, violet, or snowdrop. In Worcestershire the same superstition still lingers; to carry into some farmhouses less than a handful of primroses is to incur the reproachful anger of the farmer's wife. To her it means the destruction of a brood of young ducks or chickens. In other parts these flowers are dreaded because they are much sought after to put upon coffins and graves. Some people surround with the same gloomy associations the beautiful white sprays of the blackthorn; even in the less superstitious regions of society I have heard similar objections raised to wearing pink or white camellias.

Some older books mention a rather different use to which a primrose may be put. They direct "a youth or a maiden" to pull the flower from its

stock, and, having cut off the tops of the stamens with a pair of scissors, to lay it in a secret place, where no human eye can see it. The experimenter is then told to "think through the day of his sweetheart, and to dream of her through the night." Next morning he is to examine the flower. If he find "the stamens shot out to their former height," he is to understand that "success will attend him in love;" if not, he can only expect disappointment. The answers of this floral oracle must have been characterised by an exasperating sameness, which no doubt soon threw discredit upon its impartiality and prophetic truth.
